THE BRITISH MAGNETO SUPPLY.

THE MOTOR CYCLE

1D

Largest Net Sale. *Founded 1903.*

COVERS EVERY PHASE OF THE MOVEMENT AND CIRCULATES THROUGHOUT THE WORLD

No. 640. Vol. 15. Thursday. July 1st, 1915. Price 1d.

COPYRIGHT—REGISTERED AS A NEWSPAPER FOR TRANSMISSION IN THE U.K.

Published Weekly.

YOU GET EVERYTHING YOU CAN POSSIBLY WANT IN A BARGAIN

By choosing from our to-day's List, which includes :

3½ h.p. 1913 3-speed **HUMBER** and S'car	£42 10
4½ h.p. 1915 3-speed **QUADRANT** & S'car	£57 10
3½ h.p. 1914 3-sp. water-cooled **HUMBER** and Sidecar	£60 0
6 h.p. 1913 2-sp. **V.S.-J.A.P.** and Sidecar	£45 0
2¾ h.p. 1915 2-sp. **SUN-VITESSE** and Sporting Sidecar	£45 0
3½ h.p. 1913 3-sp. **BRADBURY** and torpedo Sidecar	£32 10
5-6 h.p. 1911 **AUTO-CARRIER**	£37 10
3½ h.p. 1914 3-sp. **HUMBER,** water-cooled, and Montgomery Sidecar	£50 0
8 h.p. 1913 **HUMBERETTE,** complete with lamp, hood, screen, etc.	£65 0
5 h.p. 1909 2-sp. **REX** and Sidecar....	£27 10
6 h.p. 1912 2-sp. **ENFIELD** and Sidecar	£47 10
6 h.p. 2-sp. **N.S.U.** and Sidecar.....	£25 0
5-6 h.p. 1909 2-sp. **REX** and Sidecar....	£28 10
3½ h.p. 2-sp. **FAFNIR** and Sidecar.....	£22 10
8 h.p. 1912 **ZENITH** and Sidecar	£48 0

The JONES SPEEDOMETER

REDUCED PRICES for 1915.

THE MOST DEPENDABLE
THE MOST ACCURATE
SPEEDOMETER IN THE WORLD.

Jones Speedometers are constructed on the centrifugal gyroscopic principle, entirely unaffected by temperature changes or the proximity of magnetic or electrical devices. Its principle is that of a natural law, as unalterable as the law of gravity, and positively constant.

Every single instrument is individually calibrated by expert instrument makers, and their accuracy is endorsed by the highest authorities the world over.

In All-Black Finish with Black Metallic Flexible Sheathing and all fittings complete.

Model 12, showing:
Total and Trip Mileage.
Speed to 80 m.p.h.

Munitions and the Motor Trade.

IT is now two months since *The Motor Cycle* drew attention to the possibility of the British motor industry being thoroughly disorganised if it were found that an adequate supply of munitions of war could not be maintained, unless every engineering firm in the country concentrated their attention upon these munitions. At the time, it was pointed out that the motor industry was sufficiently patriotic to put aside all personal considerations, and to tackle seriously the more important work on hand, viz., that of suppressing Prussian militarism. In other words, they were prepared to sacrifice at one fell swoop the exalted position that had been gained for the British motor industry after many years of careful building up by the best brains of the country. We ventured to ask at the time whether the Government was composed of men sufficiently businesslike to comprehend that, if the munitions campaign were carried to excess, the possibility of the motor industry sharing the fate of other leading British industries, due to the war, would become a certainty?

In support of our apparent presumptuousness in introducing the question of business while more important work is on hand, we would repeat that the Board of Trade continues regularly to issue circulars providing information to manufacturers, with the sole object of "capturing enemy trade." We have already pointed out that the position is an anomalous one. One section of the Government is advising manufacturers to obtain orders and cut out the enemy, and another section is urging them to work in an entirely opposite direction with "Munitions" as their motto, regardless of everything else. Again, we repeat that, if such a step is necessary, the Government may rely upon the support of all true Britishers, but what makes us very much doubt if the wholesale commandeering of materials, factories, and labour is necessary, is the fact that another of those unfortunate statements has been made by a highly placed Government official, which is in direct contradiction to all other statements on the subject. We refer to Mr. Tennant's reply in Parliament to a question on the subject of shells, when he mentioned that there was no lack of shell cases (the parts which can be turned out by motor cycle manufacturers), but that it was the other components that were mostly needed.

If this statement is accurate and could be proved by fact, then our retort can only be that the important motor industry of this country is being wrecked to provide an article of which there is no shortage. One feels a natural reluctance to criticise the Government at this stage, but those who are interested in the welfare of the British nation cannot help throwing out a word of warning before it may be too late, and an industry not only endangered but irretrievably lost.

A Sound Proposal.

A suggestion has been made to us to enable manufacturers to keep in touch with their usual business channels that, instead of the War Office taking the whole output of certain makes of British machines, they take a certain portion only, and the remainder from an outside source of supply—almost certainly America. Thus, instead of the British output being absorbed by the Army and all other connections cut off, the British manufacturer would be able to deliver small numbers to his clients, and at the same time the Government's demands would be satisfied. In fact, it would mean that, instead of machines produced in the States solely being distributed among private buyers and all British machines used in the Army, half and half of either type would be available for each section. This scheme has much to recommend it, and with the certainty of greatly increased taxation in the future, it behoves us to look ahead, and particularly to develop our trade and to retain existing business connections.

An index to the advertisements in this issue will be found on the page facing the back cover

A NOVEL CHAIN GEAR BOX.

A Three-speed Box with no Pinion Wheels.

MANY have been the attempts to reduce the noise and increase the efficiency of countershaft gears, but perhaps the most interesting construction yet devised has recently been designed by the Coventry Chain Co., Ltd.; this will shortly be placed on the market.

All those who are conversant with modern automobile practice are aware of the success of the "Noiseless" chain gear boxes employed on London motor 'buses and certain makes of taxicab, and, encouraged by their success in these directions, the Coventry Chain Co. determined to procure equally satisfactory results for the motor cycle. The most obvious difference is that in the motor cycle box roller chains are employed instead of the Noiseless type, this being due to a combination of circumstances which render the roller type more suitable to the conditions existing on modern motor cycles.

Unusual type of dog clutch used in the new Coventry Chain gear box.

Except for the fact that chains and chain wheels replace the gears, the general lines of the box resemble existing types of the countershaft gear box. Three chains only are employed, and each is in constant motion, the sprockets being locked to the shafts as required by dog clutches.

The Working of the Gear.

The primary drive (from engine to gear box) is intended to be by Noiseless chain through a three-plate cork clutch, which has three rows of corks in the single plate, thence the power is conveyed to the mainshaft, the final drive being by roller chain. The "constant" sprockets are keyed to the shafts, and there is also a pair of loosely mounted sprockets on each shaft. Top gear, or direct drive, is engaged by locking the final driving sprocket member to the mainshaft by means of a dog clutch sliding on a squared portion of the mainshaft. If this dog clutch be moved in the opposite direction, it locks another loose sprocket to the mainshaft and provides the middle ratio, the drive being from the mainshaft to the loose member on the layshaft and back to the final drive sprocket member.

To obtain the low ratio, the dog clutches already mentioned are brought to the neutral position, and a dog clutch on the layshaft locks the loosely mounted member to its shaft; thus the drive is through the constant chain to the layshaft and back to the final driving member.

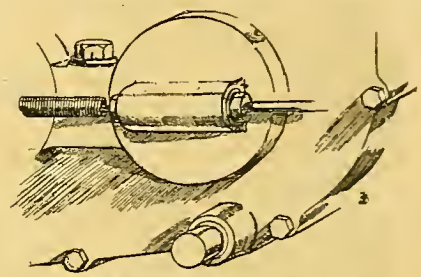
An explanation of the action is apt to sound complicated, but in reality the change speed mechanism is particularly simple, the striking forks for moving the dogs being operated by a single sliding cam plate located in the top of the box. The striking member and quadrant are attached direct to the gear box, so that the adjustment of the selecting mechanism is not disturbed by variations of the box position to compensate for chain adjustment.

The clutch actuating rod passes through the main shaft to a groove formed longitudinally in a short bar, and the groove is shaped to give the necessary lift to the push rod when the bar is pulled forward in its bush. Thus a straight pull is obtained, and dust is excluded from the point of contact.

Both main and lay shafts run on ball bearings, and the box, which is solidly constructed, is designed to clamp on to the bottom bracket.

A discussion of the merits of the chain gear box led to an interesting conversation on chain drive for motor cycles, and in particular on the use of a Coventry noiseless chain for the primary drive (as used on Matchless and Rover machines). We are informed that it has been conclusively proved that the noiseless chain provides the most flexible drive, and gives an increase in speed, due to reduction of wheel slip, with a consequent reduction in wear to the final drive and rear tyre.

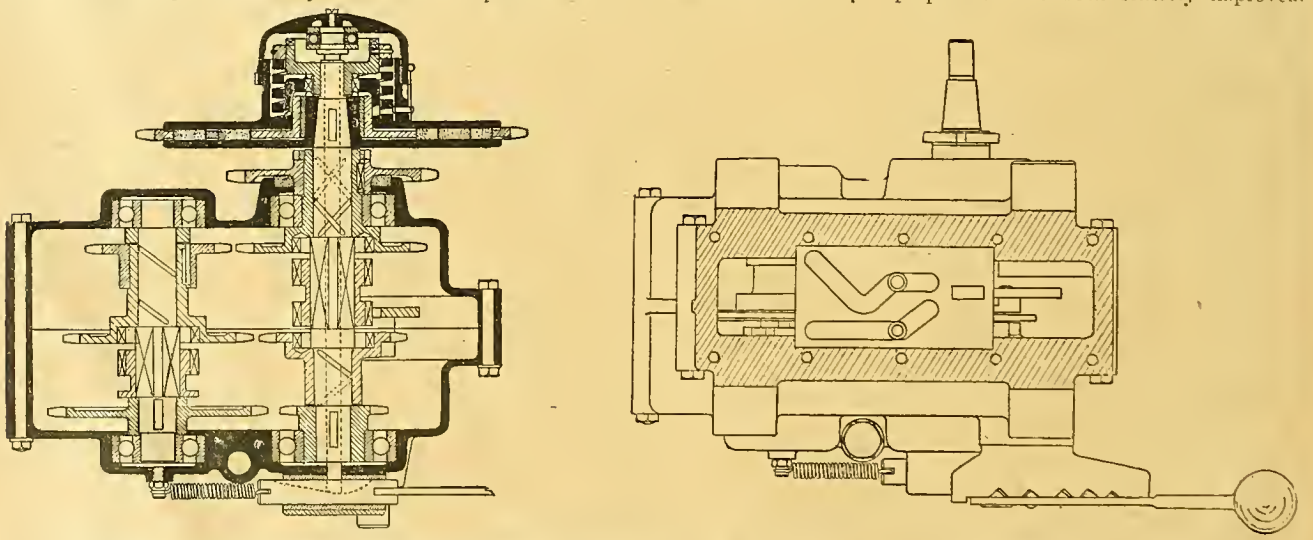
To a certain extent the noiseless chain is self-adjusting under running conditions, owing to the fact that the chain has a tendency to ride on the sprocket teeth; and whereas a roller chain and sprocket,



Clutch operating bar on Coventry Chain gear-box.

when worn, have only a line contact, and the transference of load from tooth to tooth is bound to cause noise, the silent chain, even when slightly worn, maintains a certain driving contact with many teeth at the same time. Added to this the construction of the noiseless chains renders them infinitely more suitable than the roller for the high chain speeds common to the primary drive, and, provided that the chain centres are kept short, a noiseless chain should run throughout a good season's work without any attention or adjustment.

The latest type of Coventry noiseless chain has a considerably increased rivet diameter, with the result that its wearing properties have been sensibly improved.



The Coventry Chain Company's chain gear box specially designed and built for motor cycle work. (Left) Sectional view showing dog clutches and sprockets. (Right) Plan view showing cam-plate striking gear.

Gear Box Grease Plugs.

Sergeant Harold Karslake, R.F.C., writes from "Somewhere in France" to exempt the 5-6 h.p. Ariel, which he was riding till war broke out, from my strictures on microscopic gear-lubricating plugs (of course, these criticisms were never supposed to apply to every make). His machine had a gear box inspection plate 3in. in diameter secured by three noble nuts with spring washers beneath them, and in its centre was mounted a substantial inch plug. His plan was to remove the 3in. plate once in every 1,500 miles for the insertion of half a shilling tin of Ambroleum, supplemented every 500 miles by adding a quarter of a pint of Price's hub lubricant through the 1in. hole. My paragraph brought me a number of letters; one was particularly irate. Its writer is using a peculiarly tiresome gear box, with no other means of access than a brass tap of the kind usually employed as a compression or injection cock for engine cylinders. The makers supply no grease pump, but blithely recommend that half a pumpful should be injected every 500 miles. As they do not specify the size of the pump, the user is left guessing, and he cannot verify whether the oil is above the bearing height or not without removing the gear box bodily from the frame; to do this, he must remove half-a-dozen other bulky items, including the engine!

Securing Nuts.

It may, or may not, be true that a satisfactory locking washer has yet to be invented; but the fact remains that the trade consistently warns us against its own shortcomings. Every instruction manual advises the purchaser to "go carefully over all nuts with a spanner every week," and all experienced riders are aware that if they neglect this counsel they will frequently send orders to the stores department for odd nut replacements at the absurd prices of 2d., 3d., or 4d. a time, fees which are necessary from a trade standpoint, but far outweigh the value of the nut, and represent stockcarrying, wages, and postal charges. That our machines shed nuts is hardly surprising, if we realise that plated nuts are fitted to plated bolts, that no spring or locking washers, or castellated nuts and split pins are employed on a number of machines. I admit that locking washers are expensive and imperfect; and that castellation and split-pinning adds unreasonably to the cost of a machine, and is often regarded by users as a nuisance. But here is the solution adopted by a manufacturer of a very cheap light car. Under every single nut on the car there is a split spring washer. After every nut is put in place, the bolt head is given a light tap with a copper-headed hammer, which imposes just sufficient "burr" to prevent the nut ever vibrating clean off its thread. Finally, every single bolt and nut is painted over with a thick black paint, which makes the nut absolutely vibration proof, and can easily be replaced by any private owner after the nuts have been removed for any purpose. Weekly routine, lost nuts, and rusty parts are thereby eliminated at one stroke, and that with the minimum of expense. There is much to be said for the notion. Highly plated nickel looks splendid on a show stand, but the rough rider has nothing but bad words for it after a ride.

Cleaning out a Levis.

My Levis Popular has just completed 1,900 miles by speedometer, which with a few unchecked rides, just about makes up the 2,000. It has been running as well as ever, but I was impatient to see the inside, so the other day I took the engine down, and found that the three bolts attaching the engine to the frame could not be pulled out because they were too tight, and could not be driven out, as the flywheel got in their way. Presumably the makers intend one to detach the flywheel, but not every amateur possesses a drawing tool (the last borrower appears to have annexed mine permanently!). I suggest to Messrs. Butterfield that if they drilled a couple of holes in their flywheels this nuisance would be overcome. As it was, I wriggled the engine out by removing the cradle bodily. I was astounded at the exiguity of the carbon deposits. There were a few flakes barely jutting into the exhaust port, the cylinder head was practically clean, the deflector on the piston carried perceptible deposits on its steeper slope, but its gentler slope was merely stained. Cleaning these two-stroke engines is child's play; they can be carried in one hand, and are readily made to look like new by brushing in a small basin of paraffin. Let nobody in future try to contradict me when I say that drip-feed oiling, with ducts, is the goods, for I have yet to unearth an air-cooled four-stroke engine which can run nicely for 2,000 miles without a clean. Of course, the drip has to be adjusted to suit one's speed, but in practice one soon learns that it has just two positions, viz., "traffic" and the "open road." In time, no doubt, some genius will invent a truly automatic system for the babies; in the meantime, the duct-drip is good enough for me.

A Rare Bird.

The other day I met a *rara avis* in the shape of a motor cyclist who uses a motor attachment clipped inside the diamond frame of a pedal cycle. I had fancied that this species was practically extinct. His particular mount took the form of a J.E.S. attachment, and he thinks nothing of doing 120 miles in a day, of averaging 20 m.p.h. in the level Midlands, and of covering upwards of 150 miles on a gallon of petrol. His sole complaint is that the swinging pedals make extremely uncomfortable footrests on long rides—a weakness from which the earlier motor cycles suffered, as I well remember, and that the frame dimensions and construction do not readily lend themselves to the attachment of a pair of fixed rests in a convenient position.

SPRING FRAME DESIGN.

Some Notes on the Cantilever Spring as Applied to a Motor Cycle.

THE progress which has attended the evolution of the motor cycle is distinctly remarkable. Its simplicity of construction and operation, its great economy, and its convenient dimensions render the motor-propelled cycle an object of the keenest interest to the general public. The astonishing efficiency of the modern air-cooled engine, together with its chief adjuncts, the carburetter and high tension magneto, has long since banished all doubt as to the utility and advantages of the motor cycle.

Now there is no doubt whatever that to impart the finishing touch to the success of the motor cycle as a means of locomotion for the masses, to make it appeal immediately to every class and condition of the community, and last, but not least, to ensure an undeniably reliable high speed and a strong machine for our military service, a perfected principle of frame suspension is essential. So long as the motor cycle continues to be constructed as a rigid, or partially rigid, vehicle, so long will that complete success and general favour, which it deserves, remain in abeyance. This is the conclusion at which I arrived nearly two decades ago, and to-day I see no reason to change the judgment then expressed. The spring front fork is a fair palliative, but a vastly improved method of suspension is the desideratum at present lacking.

A Period of Transition.

In the early years of the motor movement I used the only vehicle then evolved, namely, the motor tricycle, followed in speedy stages by the Bollée type tandem, the quadricycle, the Werner and other front-driven two-wheelers, and then the four-wheeled car. Thus gradually the sterling simplicity of the motor cycle was forsaken for the comparative complication of the motor car proper. My reason for this transition from the lesser to the greater vehicle was the natural one of seeking greater comfort a-wheel by avoiding the effects of vibration. That reason, coupled with the knowledge of long experience that machinery racked by rough road surfaces becomes deranged rapidly, was, and is still, the chief objection to the motor bicycle. Most cheerfully would I re-adopt the mount of bygone days if I and it might traverse the highway protected properly from the dire evil of vibration.

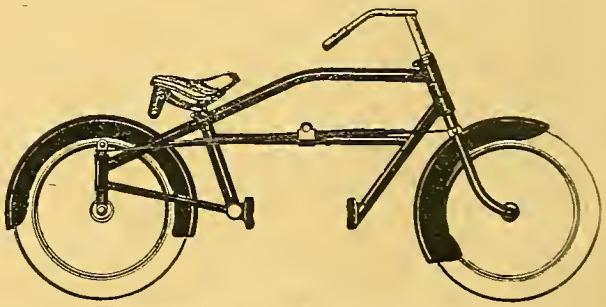
More than five years ago a description was given me of a new notion to supersede the rigid-framed motor cycle. The system was simple enough: that is to say, a pair of short semi-elliptic springs was interposed between the machine's fork ends on either side of each wheel.

Those who are acquainted intimately with the constructional evolution of the four-wheeled motor vehicle know full well that considerable ingenuity has been exercised in endeavours to improve the spring system. Every imaginable kind of spring has been tried—the helical spring, the bow spring, the grasshopper spring, transverse front or rear springs, etc., etc. From all this there has emerged triumphantly, and in no uncertain fashion, what is termed the cantilever spring, that is to say, merely an inverted nearly flat grasshopper spring, hung at three points in a special manner.

It is now proposed to place this system of springing within the reach of the motor cyclist, and to afford him easily, and with the utmost simplicity, the means to enjoy all the comfort that is at present only obtainable on the seat of an expensive, high-powered touring car. The motor cyclist possesses already speed in abundance, accompanied, as I have pointed out, by truly remarkable economy and efficiency. All he asks for is the comfort of a perfect spring frame.

Detailed Description.

Briefly, then, as will be gathered from the drawing at a glance, this most desirable innovation is accomplished by using a single pair of cantilever springs, bracketed by a trunnion on the centre tube of the frame, and terminating at each extremity on enclosed cylindrical slides attached to the front and rear axles respectively. These slides, to which the spring ends are linked to constrain the vertical motion of the wheels to a straight line path, are interesting in that



The spring frame described by the writer of the accompanying article.

they remind the practical engineer of the horn-plates familiar to the locomotive driver. It is also to be observed that these twin springs, set laterally, and in close proximity with the frame tubes and held by a single trunnion, have a very important characteristic. For they are capable of being rendered more supple or less elastic, according to requirements, because the bracket trunnion is slidable along the frame tube to which it is secured by a readily adjustable clamp. In this manner, if the clamp be moved rearwardly the back halves of the pair of springs are stiffened thereby, while, coincidently, the flexion of the front halves is rendered more lithe as the position of the pivoted point of support is changed.

The writer considers this novel, neat, and eminently workmanlike utilisation of what is virtually a single spring for a pair of wheels constitutes one of the most valuable improvements yet devised for the motor cycle, and that the manner of resisting the stresses and the great length of the spring in proportion to that of the machine itself is an unrivalled advantage. Again, the feature that the springs are situated at the upper part of the frame is excellent, inasmuch as dirt and grit are prevented from impairing their action.

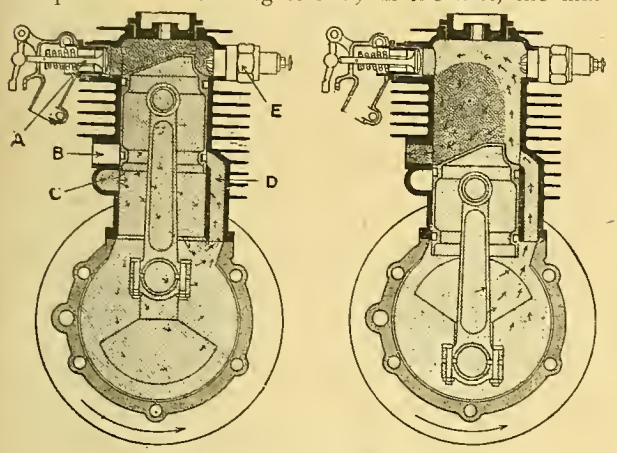
JOHN ARMSTRONG.

ROAD TESTS OF NEW MODELS.

THE 2¼ h.p. TWO-STROKE ENFIELD.

Engine 64 × 70 mm. bore and stroke (225 c.c.) Two-speed gear, ratios 5·4 and 9·3 to 1. Chain transmission, slipping clutches, and cush drive.

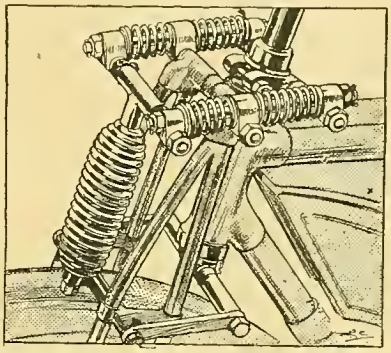
WE have recently been putting the 2¼ h.p. Enfield two-stroke lightweight to a practical test on the roads. By way of preface a few words on the construction of the machine will not be out of place. The engine is of the usual three-port variety, having the inlet and exhaust ports in front and the transfer port in the rear. The release valve is connected with the exhaust pipe—a very desirable feature. The accompanying sectional drawings show the engine in two positions, at the commencement and completion of the firing stroke; in the first, the mixture is entering the crank case at the inlet port C, and a charge is compressed above the piston; in the second the charge is being transferred through the port D from the crank case to the cylinder, where it is taking the place of the exploded charge shown by the darker shading; the latter at the same time is making its exit through the exhaust port B. Contrary to usual practice the flywheel is mounted on the right-hand side, the left end of the crankshaft being reserved for the sprockets carrying the driving and magneto chains.



Enfield 2¼ h.p. two-stroke engine.
A. Release valve. B. Exhaust port. C. Inlet port.
D. Transfer port. E. Sparking plug.

The lubrication is on the "petroil" system, a small cup being provided as an oil measure; this cup must be emptied into the tank six times for every gallon of petrol placed therein. The cup is filled from the tank by a pump, and when not in use it is carried clipped below the tank covering the pump nozzle.

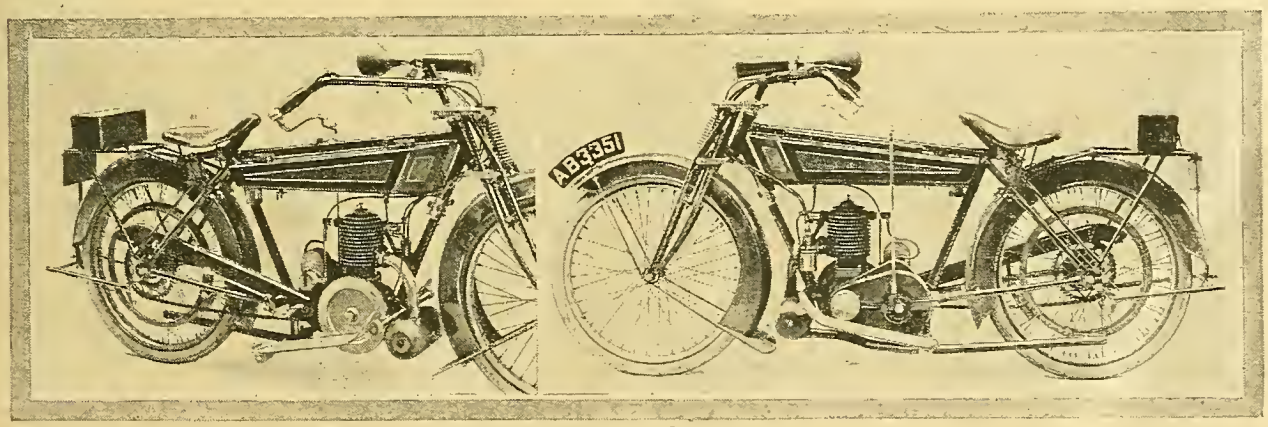
The Enfield two-speed gear naturally finds a place on the machine; this can hardly be misused by the veriest novice, and is well-known for its reliability. The front fork springs contain a novelty which is clearly shown in the sketch on this page, and combine the up and down movement of linked forks with the rocking, or backward and forward, movement peculiar to the hinged variety.



New design spring forks designed to give a combined movement.

On the Road.

When we took the machine on the road its hill-climbing ability was at once apparent, and we found that the Coventry test hill at Stoneleigh could be easily ascended on top gear with a hot engine. Starting was extremely easy; the machine could be paddled off, whether hot or cold, in a yard or so, and was pleasant and comfortable to ride at moderate or slow speeds, but when the pace was increased, the writer, being accustomed to the 3 h.p. twin Enfield, which runs very smoothly, found the vibration in the handles and footboards more noticeable. The



Both sides of the Enfield two-stroke lightweight.

Road Tests of New Models.—

handle-bars were not the standard pattern, but were extra long. This possibly accentuated the vibration; also it is only natural that metal footboards should vibrate more than wooden ones sprung at the forward end.

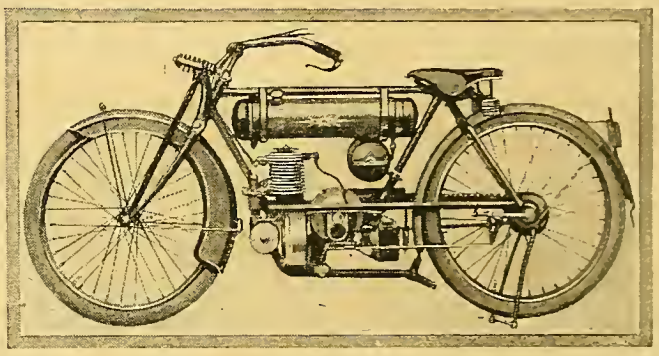
We made no endeavour to reach the extreme speed, but the machine touched 30 m.p.h. without being opened out fully. The exhaust was quiet, unusually so for a two-stroke engine which is often very noisy.

We noticed that, in case of tyre repair, the back part of the rear mudguard, together with the carrier, could be quickly removed after slackening two nuts—the nuts need not be taken off; we did not have to experiment with this, but the toolbox contained a repair outfit ready for emergencies, spare links for the chains, and a roll of tools.

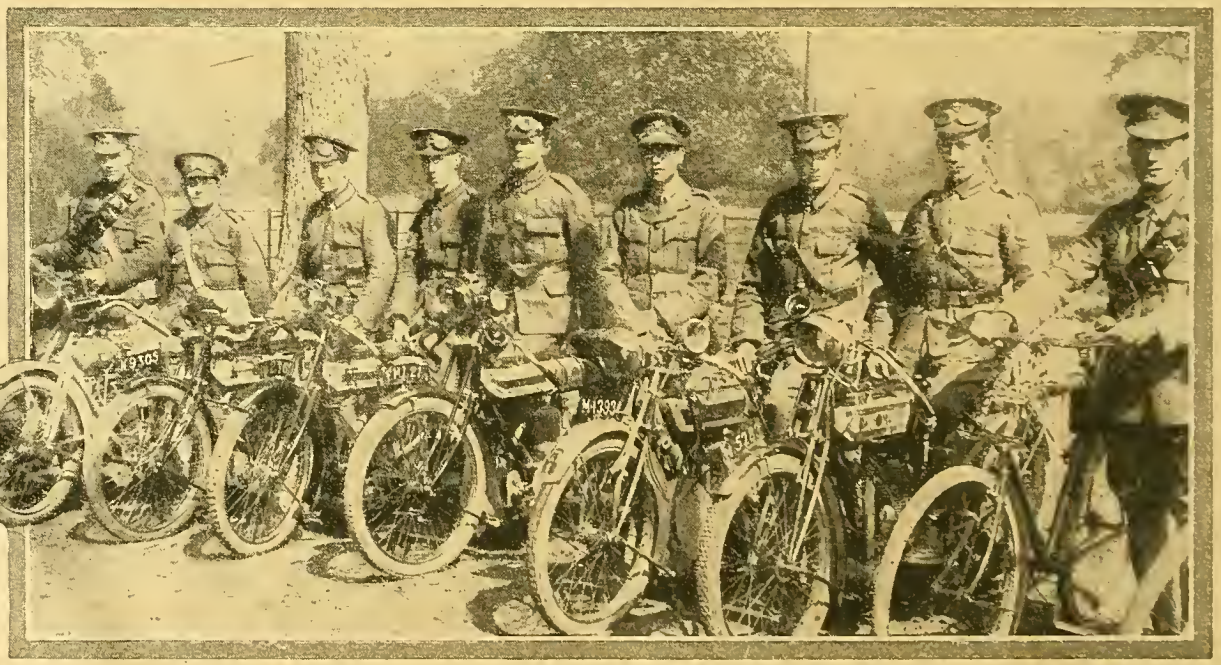
Finally, we must mention the fact that the entire output of this little machine has been booked for some months to come.

A New American Lightweight.

A TWO-STROKE lightweight embodying some novel points is being produced in Cleveland, U.S.A. The engine, which has a bore and stroke of 63.5 × 70 mm. (222 c.c.), is of the three port type, mounted with its crankshaft longitudinal in the frame, and drives the two-speed gear by means of a shaft and worm which also drives the magneto; this is placed in an inverted position behind the gear box. Driving ratios of 5 and 10 to 1 are provided. A large multi-plate clutch is placed between the gear box and the chain to the rear wheel. The chain sprockets are of equal size, and both small. The machine is equipped with a B. and B. carburetter and Brooks saddle, and although many of the features are unusual, several are strongly reminiscent of a well-known Coventry machine, notably the front forks, mudguards, tank fixing, and cylinder. A consumption of nearly 120 m.p.g. is claimed, the tank holds 1½ gallons, and an extra tank, which acts as a reserve, is provided. The lower part of the frame is double, the motor being mounted within the side members. A band brake is fitted on the rear wheel operated by the left foot. Other features include 26in. × 2¼in. tyres, knock-out axles to both wheels, and a 52in. wheelbase. Lubrication is on the petroil system, and the machine is said to be capable of a speed of 35 m.p.h.



A two-speed two-stroke American-made lightweight, which, in certain parts, bears a strong resemblance to a famous English machine.



DESPATCH RIDERS ATTACHED TO THE CHESHIRE YOEMANRY.

THE BRITISH MAGNETO SUPPLY.

PRESENT OUTPUT OF BRITISH-MADE MAGNETOS AND FUTURE PROSPECTS.

READERS will recollect that since war broke out we have on more than one occasion referred to the magneto supply question. To refresh short memories it may be mentioned that up till last August about nine-tenths of the magnetos used in England came from Stuttgart, consequently a rather serious position arose, as, owing to lack of support by British car and motor cycle manufacturers, British electrical firms had devoted very little attention to the production of magnetos, and the output of the British-made article was so small as to make very little difference to the general outlook. Fortunately, American electrical manufacturers came to the rescue, and since the war British firms making magnetos have, by reason of great efforts, arranged for considerably increased outputs, the only limitations to which at present are shortage of labour and material.

In order to obtain an idea of the present position and prospects of the future, we have asked the principal makers of British magnetos their views, and the replies set forth below are both interesting and instructive. We give herewith a copy of the letter addressed to the magneto manufacturers. Immediately following are the replies received:

[COPY OF LETTER SENT TO THE PRINCIPAL BRITISH MAGNETO MANUFACTURERS BY THE EDITOR OF *The Motor Cycle*.]

"I am writing to ask you if you will kindly give me some information for the benefit of the readers of *The Motor Cycle* as to your present output of magnetos and future prospects in this direction. There appears to be a great amount of misconception among users as to the present magneto position. Some people think that after peace is declared motor cycle manufacturers may be obliged to fall back upon German and American sources of supply through the home magneto makers not being in a position to deliver the necessary quantities. This assumption is natural, seeing that motor cycles are still being delivered with magnetos not of British origin, whereas the public were led to suppose that by this time British makers would be in a position to satisfy all needs.

"*The Motor Cycle* has always encouraged the British-made article, and I would appreciate a brief statement from you suitable for publication."

REPLIES FROM BRITISH MAGNETO MAKERS.

C. A. Vandervell and Co.

(Makers of C.A.V. magnetos.)

"Our output of magnetos suitable for motor cycles is at the present time about six hundred machines per week—in other words, about a hundred per working day—but it is only a question of securing the raw materials and overcoming certain difficulties in regard to labour that is preventing us from manufacturing double this number.

"As we believe you are aware, we in the first place avoided introducing a full range of models, our idea being to concentrate upon one particular type suitable for motor cycles, and thus enable us to get on to a proper manufacturing basis quickly. We thought that doing this was far better than attempting to produce several models, as this would naturally handicap any manufacturing proposition of this character.

"Your remarks that many people consider that motor cycle manufacturers will, after peace is declared, fall back upon German and American sources are undoubtedly only too well founded, for we have ample evidence already that motor cycle manufacturers in this country are not prepared to pay more for the British-made article, although it may be infinitely superior in every way to the foreign machine.

"Whilst manufacturing conditions are more or less normal in the States, they are, as you are fully aware, very abnormal here. The prices ruling for raw materials and also labour in connection with magnetos are extremely high; in fact, both labour and materials have gone up from 50% to 100% since the war started. In the case of ebonite parts 500% advance would be nearer, and while we are working under such disadvantages compared with America, it is naturally impossible for us to produce as cheaply as they do, although we flatter ourselves that we are producing a much superior article.

"What Germany will be able to do after the war in regard to competition is another matter; but we are inclined to think that things will level up somewhat then in regard to price all round. But the competition from Germany will naturally be very keen, as well as from America; and if motor cycle manufacturers are not prepared to pay a little higher price for the British article, in preference to either the German or the American, until such time as we are able to produce in very large quantities and thus bring down the manufacturing cost, we are afraid that British manufacturers of these specialities will have to play 'second fiddle,' or the British Government will have to look after their interests by making a small protective tariff of something in the neighbourhood of 10%."

The M.L. Magneto Syndicate, Ltd.

(Makers of Morris-Lister magnetos.)

"We are increasing our output week by week, the present output being 200 per week. The difficulties in obtaining labour and material have prevented a more rapid increase, but these difficulties are being overcome, and in the near future we shall be turning out between 400 and 500 magnetos per week for which we already have the necessary machinery and plant.

"At present our business is confined to a few well-known firms, to whom we have been making good deliveries since the end of last year. A good proportion of this output is for Government requirements.

"We have in hand a scheme for increasing production up to 1,000 magnetos per week, but under present conditions it is not possible to say when this will be completed. The necessary arrangements are being pushed forward as far as possible in order that we may be in a position to accept substantial contracts immediately conditions become more normal.

The British Magneto Supply.—

"In our opinion, there should be no necessity for motor cycle manufacturers to purchase abroad after the war. The number and standing of the firms who are taking up the manufacture of magnetos in this country is ample to ensure a production equal to the demand.

"That motor cycles are now being fitted with foreign-made magnetos is due to the difficulties under which British firms are working, difficulties which American competitors are not experiencing. In such a crisis as the present, Government requirements must have first call on all labour, plant, and material.

"But there will be big developments after the war, and we hope that you will use your influence to secure such encouragement from the Government and from the motor trade as will see this new industry firmly established.

"The old policy was a dangerous one. To depend entirely on foreign supply for any military or industrial necessity might easily result in a hopeless handicap in the event of war."

Nicole, Nielsen and Co., Ltd.

(Makers of Watford magnetos.)

"We have just completed an extension to our works capable of accommodating four hundred workmen, and have acquired sufficient land for further extensions to enable us, if necessary, to erect buildings to accommodate several thousand men; so you will see that we are not going into the magneto business with the idea of manufacturing only in such quantities as may be required during the war."

Thomson-Bennett Magnetos, Ltd.

(Makers of Thomson-Bennett magnetos.)

"The fears which are entertained by a section of the public remind us very much of the fears which are entertained by others as to the ability of this country to furnish itself with supplies of war material.

"It seems to us that a section of our fellow countrymen are always under the impression that there is no enterprise in this country, and that, unless we are booming every move that we have taken, nothing whatever is being done. On the other hand, there is a large section of manufacturers who go to work without talking about it, and are more concerned with getting on with the business than in making statements as to what they will be doing.

"That, we think, is the explanation of why more has not been written from the magneto manufacturers' point of view of what has been undertaken since the war broke out.

"One reason why the private owner is not seeing as many British magnetos as he expected is due to the fact that, first and foremost, the requirements of the naval and military authorities are receiving attention. We doubt if the outside public realises the immense number of petrol-driven engines of every possible description that is being supplied to the Government at the moment. The private owner only gets the balance. This may not be as great as was anticipated, but the war has brought problems to be solved which were not anticipated some months ago.

"You can assure your readers, therefore, that they need have no fear; matters are being pressed on with all the speed that is possible. As regards our own concern, we could give you names of dozens of manufacturers who are using our magnetos in large numbers, and are satisfied with the quality. The output is being increased every week, and on the return of normal conditions, when we are freed from the necessity to give first attention to war material, there will be a large additional number released for ordinary requirements.

"As we can supply in this country the best of all other fitments for the motor trade, and in the large quantities which are required, so it will be with the magneto, and any firm who wishes to supply all-British machines from start to finish will be able to do so."

The Electric Ignition Co. (1913), Ltd.

(Makers of E.I.C. magnetos.)

"Our present output of magnetos is about 300 per week, and it is our intention to equip for an output in accordance with the demand.

"Your knowledge of the average British manufacturer will help you to appreciate the trouble we have had to obtain many materials which hitherto had not been made in this country, and for which the British makers, with their usual pessimism, did not believe there would be a lasting market.

"If the trade union rules which prohibit the employment of female labour were suspended, it would be a very great assistance to us, as to many other manufacturers.

"The chief trouble, namely, difficulty of obtaining material, is one that should disappear after peace is declared, and then we could supply the bulk of the home trade with magnetos suitable for two-strokes or any single-cylinder engine up to 6 h.p.

"At the present time we know of several firms who are fitting foreign-made magnetos purely from a point, as they say, of a slight saving in actual cost; in fact, it may interest you to know that several firms have been patriotic enough to tell us that as soon as they can obtain the German machine again they will fit it."

The Runbaken Magneto Co., Ltd.

(Makers of Runbaken magnetos.)

"We are afraid at the present moment the British manufacturers are placed at a serious disadvantage against American makers. We, ourselves, together with practically every large firm in this country, are at present engaged on Government work, and are also handicapped through shortage of skilled men; the manufacture of magnetos is not receiving the attention it should.

"The writer also regrets to say that most of the English machines that he has so far inspected are very shoddy, and in no way to be compared with the German machines, and unless the various manufacturers are able to give more attention to the making of these machines, there is a very big chance of the car and motor cycle manufacturers falling back on the former sources of supply."

A. H. Boulton and Son.

(Makers of Boulton magnetos.)

"We have made magnetos for three years, but previous to the war we obtained most of our materials from Germany. We have now succeeded, after a great struggle, in obtaining British material, which is as good as the German.

"We have ample proof that our magnetos are as good as those made in Stuttgart—in fact, they are copies—but the prejudice is so great that we believe that on the cessation of the war German firms will be flooded with British orders, and American magnetos will be very cheap. There are secrets in the manufacture of magnetos, without which it is like trying to 'make a silk purse out of a sow's ear.'"

British Thomson-Houston Co., Ltd.

(Makers of B.T.H magnetos.)

"It would appear from your letter that the manufacturing difficulties are not fully appreciated by your readers. It must be remembered that up to the time the war started British manufacturers had received so little encouragement that practically no magnetos had been manufactured in this country, and it was found that on the outbreak of the war the source of supply had suddenly become interrupted, and English manufacturers were then immediately appealed to to undertake the manufacture of magnetos.

"Even in peace times, when material and labour could have been obtained in plenty, it would have been no easy matter to start this new industry and give adequate supplies of the completed article. In war time the development has naturally been much more difficult, and has taken a much longer time, owing to the very great difficulty experienced in obtaining the necessary material and suitable labour.

"It will, no doubt, be of interest to your readers to know that the development stage has now passed, and the necessary tools, etc., have been mostly completed, and the quantities being delivered are increasing every week. As to when the total demands are likely to be satisfied with British-made magnetos, it is somewhat difficult to decide, owing to the total requirements being somewhat indefinite, but it may be accepted as a fact that directly the war is over, and the material and labour market return to their normal position, there should be no difficulty in satisfying the demands.

"Another reason why it is difficult to give the manufacturers all they require at the present time is the large amount of Government work which must necessarily be undertaken by the various factories engaged upon magneto work."

THE NEW COUNTER-SHAFT

ROVER

Extract from Ireland's "Saturday Night":

RELIABILITY TRIAL IN CONNECTION WITH THE ULSTER CENTRE OF THE MOTOR UNION.

"George Graham (3½ h.p. Rover and Sidecar) was first . . . . . .

"I am sure that all his fellow-competitors will agree no better sport could have won the event than George Graham, whose new Rover covered itself with glory by the way in which it took all the test hills including the terror at Feestown. It was a supreme test of hill-climbing for a passenger mount of such moderate horse-power."

SIDECAR COMBINATION COMPLETE

£80 : 0 : 0

JOHN PIGGOTT'S JULY SALE

68 PAGE LIST FREE.

MOTOR CYCLISTS' OVERALLS. FOR WIND, RAIN, or DUST. **WATERPROOF DEPARTMENT.**
All Garments are guaranteed absolutely Waterproof. All Seams stitched through, overlapped, cemented, and taped. When ordering Motor Suits, please state Chest Measure taken over jacket worn, and inside Leg Measure.
RJ71. **OUR FAMOUS "J.P." TOURIST OVERALL MOTOR SUIT.**—Strong and Waterproof, made of extra stout untearable Fawn Twill, double texture. This material is specially recommended to stand the hard wear that Overalls usually get. **The Jacket** is made double-breasted, 36in. long, with Prussian collar, throat tab, inside wind cuffs, adjustable, tabs on sleeves, square pockets stitched right through, cut roomy, with loops for belt. **The Trousers** are made in the Seatless Overall style, with spat and gaiter front, storm gusset, lever clip fastening leather waist and boot strap, and shaped to fit well up in fork of leg. **This Outfit complete is offered during the Sale only at 30/6.** Usually sold 40/-.
JACKETS ONLY, **20/3.** Usual price, 21/6.

MOTOR CYCLISTS' DUST OVERALLS.
KJ241. **Olive Heavy Twill Drill Double-breasted Jackets and Seatless Gaiter Trousers** (heavily rainproofed). Usual price, 28/-. **Sale Price, 23/4.**
Sizes stocked, 36 to 44 chest.

KJ242. **EXCEPTIONAL OFFER. SHOWER AND DUST-PROOF MOTOR SUIT** in Olive Twill, very strong. The Jacket is Double-breasted, fitted with elastic wind cuffs, the overalls fasten with side strap to brace buttons, are easily slipped on and off, and the spat is kept in position by small strap, making a most sightly and useful Suit. Worth 25/-. **Our Special Price, 1 /-.**
36 to 44 chest in stock.

KJ243. **8 Pairs only Shower and Dustproof SEATLESS GAITER TROUSERS.** Fitted with Gusset and Patent Fasteners at side, easily slipped on, in the following sizes only:
Sale Price, 9/6
Postage 4d.

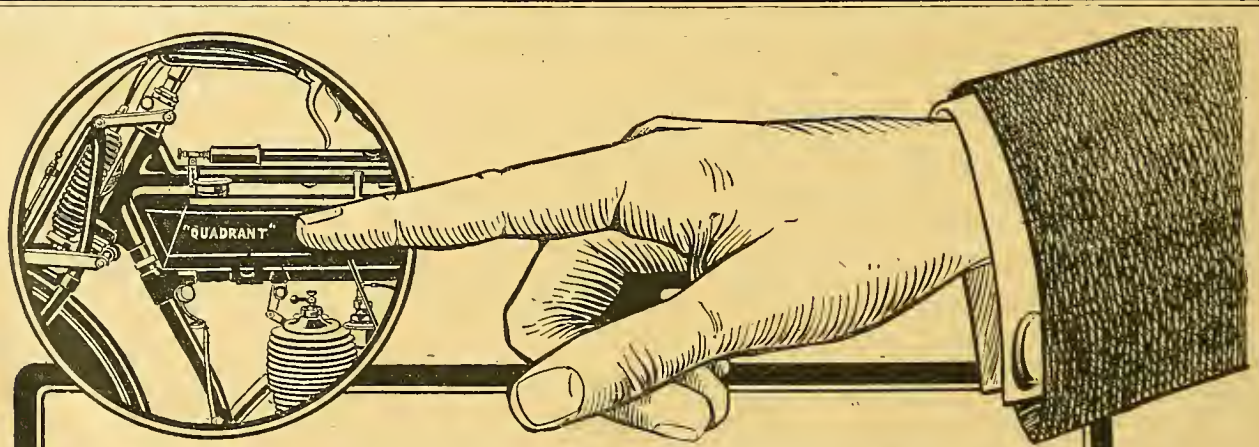
Waist	32	32	34	40	40
Leg	31	33	33	31	33

Cannot repeat when sold.

KJ244. **15 Pair only Shower and Dustproof LEGGINGS**, fitted with Gusset and Patent Fasteners and Side Strap to fasten on brace buttons. **Sale Price, 7/6.** Postage 3d.

HOLLAND DUST JACKETS, &c.
"The Road" (as sketch). **Holland Dust Jackets and Overalls.**
KJ245. **STRONG WASHABLE HOLLAND JACKETS.** Usual 6/6. **Sale Price 5/11**
Postage 3d.

KJ246. **HOLLAND LEGGINGS, to match ROAD JACKET.**
Usual price, 3/6.
Sale price, 3/-
Postage 2d.



That's the Name

which enables you to get the best out of the pastime. That's the name without a query—

QUADRANT—

the name which is spoken of with the greatest possible enthusiasm by every rider of the mount which bears it—the name that ensures a faultless service—a service which again ensures a "touring time" of unalloyed enjoyment. No query—no trouble—a really "trusty steed" never failing "out or home." It is made in several models—here is one—

THE QUADRANT 4½ h.p., with B.S.A. Countershaft 3-speed gear—solo £55; combination £66 - 11 - 0.

Let us send you fuller details.

QUADRANT WORKS, Lawley St., Birmingham. London Depot—78, Gt. Queen St., Kingsway.
Note that the above and all other Quadrant prices are now advanced by 5%.

No Query about Quadrants

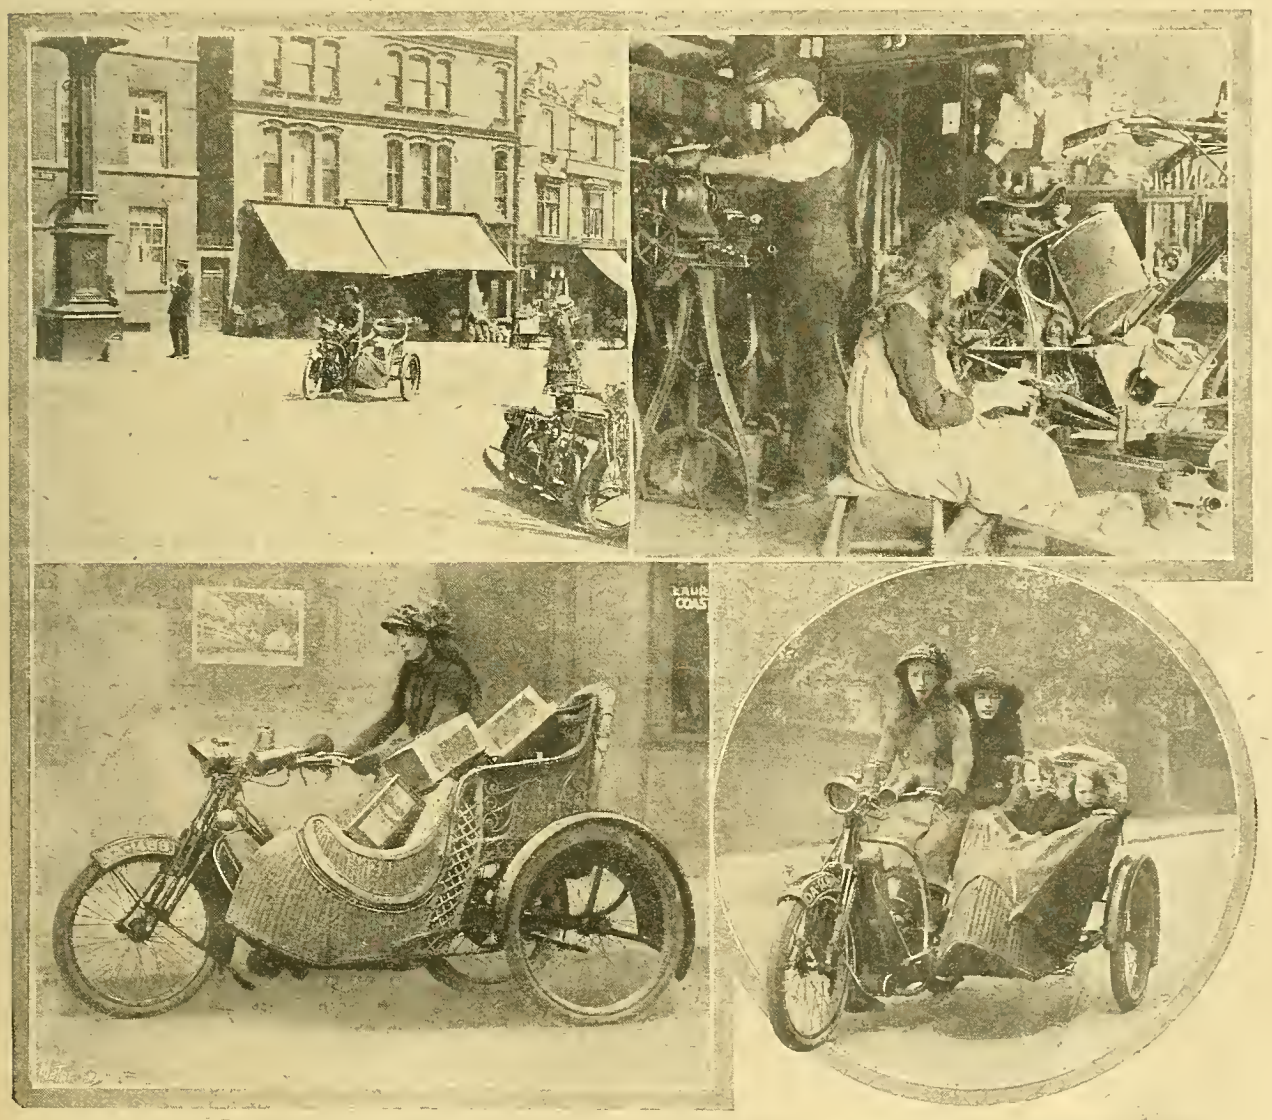
The British Magneto Supply.—

From the tone of these letters it is surprising to learn that after peace is declared motor manufacturers may fall back upon German and American magnetos. Whether this would be due to lack of magnetos from British makers, or because of the slight extra cost of the British-made article it is difficult to say. In all probability if the war is over in another year it will be due to both causes. There is no doubt that in spite of improved output the number of magnetos being produced in England is still far short of requirements, and although this shortage will gradually be lessened, no vital change can be expected whilst there is a lack of labour and material—both due to the war.

It is to be regretted that there is still in some quarters a disposition on the part of car and motor manufacturers "to throw cold water" on the efforts of the British electrical firms.

An Accomplished Girl Mechanic-driver.

IN these days of women replacing men in so many and varied spheres of work, it is interesting to record the duties performed by the daughter of a Birmingham dealer. Miss Louie Ball, age 15, is something more than a keen motor cyclist. She knows all about the machine she rides, and is capable of tuning up and generally helping her father, the Scott sub-agent for the Edgbaston district. Besides making short trips delivering petrol and oil she has on several occasions driven Mr. Ball to the Scott works at Shipley, a distance of 120 miles, to take delivery of new machines. On these occasions her father occupies the sidecar, and drives back the new machine while Miss Ball follows with the empty sidecar.



Miss Louie Ball passing Five Ways, Birmingham, with a load of petrol in the sidecar.
Starting off to deliver petrol

Helping to tune up a Scott in her father's repair shop.

Taking her sisters for a run.

MOTOR MACHINE GUN SERVICE.

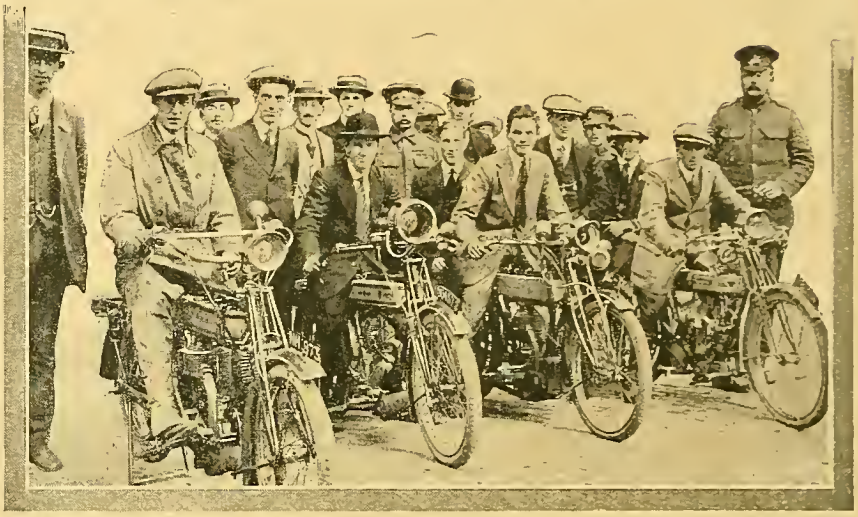
Vacancies for Motor Cyclists, Mechanics and Car Drivers.

FIFTY first-class motor cyclists are required immediately for enlistment in the M.M.G.S. (R.F.A.), pay 1s. 2½d. per day, all found, usual separation allowance. Also a limited number of qualified car drivers and mechanics, the pay in this section being 6s. per day, all found, the usual separation allowance. Car drivers must have had at least three years' driving experience, and be able to execute all running repairs. Candidates for enlistment as artificers must have held similar positions in motor cycle factories or leading garages, and be able to perform any repair to an engine, gear box, or other part of a motor cycle, no matter how difficult. Two references are required. Age limit, 19 to 38; ex-soldiers up to 45.

Further particulars may be obtained from Mr. Geoffrey Smith, Editor *The Motor Cycle*, 19, Hertford Street, Coventry, and all recruits who can possibly do so should attend an inspection to be held at the Recruiting Office, Masonic Buildings, Little Park Street, Coventry, on Wednesday next, July 7th, between 2.30 and 4 p.m., when men accepted will leave for the training centre forthwith. Married men should bring with them their marriage and children's birth certificates. Groups of friends who now wish to enlist will, as far as possible, be allotted to the same battery. Motor cyclists in the Bristol district should apply to Mr. H. Smith, Inspecting Officer, South Midland Divisional Area, Queen's Hotel, Bristol.

During the last few days the following have been attested for the M.M.G.S. :

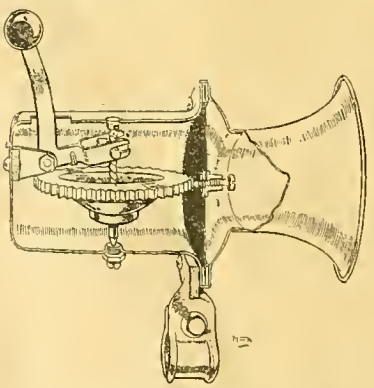
G. F. Bainbridge E. W. Macro W. Letheren	Motor cyclists
H. Colwell T. C. Pett	Car drivers.
W. R. White J. Henderson	Artificers.



A batch of recruits accepted by the editor of *The Motor Cycle* on the 23rd ult. The four motor cyclists in the foreground were passed for the waiting list of despatch riders, whilst the others were enlisted in the Motor Machine Gun Service.

THE SPARTON HORN.

A USEFUL accessory which we lately had an opportunity of inspecting at Messrs. Brown Brothers is the Sparton horn—a hand-operated horn emitting a Klaxon-like note. It is brought into operation by pushing forward a lever, attached to which, inside the body of the horn, is a thick piece of felt, which prevents the dust from entering the mechanism. The latter is quite interesting, and works on the principle of the Archimedean drill. It is, moreover, simple to use, the principal moving part being the large toothed wheel driven by the Archimedean screw, the teeth of which come into contact with the point on the diaphragm.



The Sparton mechanical horn cut away to show method of operation.

SOUTH AFRICAN ROAD RECORDS.

SOME little while ago we alluded to records claimed to have been made in South Africa, and to the fact that we had received a letter from an independent source throwing some doubt upon the genuineness of these records. Since then we have received letters and certificates from the organisers and time keepers, which leave no room for doubt that every care was taken to ensure accuracy in the measurements and times. It is to be regretted that there is no ruling body in South Africa to pass and hall-mark records made in that country. In the absence of such a body, and in the interests of our readers, we find it necessary to exercise great care, but now that we have received full particulars and guarantees respecting the time-keepers and their watches (at the high speeds attained an error of three-fifths of a second means a difference of over 2 m.p.h.), we are glad to give publicity to the figures. The attempt was made by three riders of the 7 h.p. Indian, on a straight stretch of road twenty-four miles west of Johannesburg, and the following are the times credited :

ONE MILE, FLYING START.

*D. Owen	...	46⅗s. = 77.25 m.p.h.
H. E. Kelly	...	53⅕s. = 67.67 m.p.h.
G. Weddell	...	56s. = 64.28 m.p.h.

HALF-MILE, FLYING START.

*D. Owen	...	21⅗s. = 83.33 m.p.h.
H. E. Kelly	...	25⅕s. = 71.44 m.p.h.

*Road records.

MOTOR CYCLE RECRUITS WANTED.

MOTOR cyclists are wanted for the Royal Flying Corps. Suitable men of nineteen to forty years of age may enlist for duration of war, and men from eighteen to thirty for normal period, *i.e.*, four years with the Colours and four years with the Reserve. Pay 2s. per day. Candidates must be able to execute all running repairs and have the usual riding experience.

Corporal W. H. Garlick, of the 30th Signal Company, R.E., now stationed at Grantham, on his 2¾ h.p. Hobart. In pre-war days, as at present, Mr. Garlick was a keen Hobart rider, and won his class at the Pen-y-Ball hill-climb in September, 1913. His machine is giving him every satisfaction.

The survival of the fittest

To-day the only Sidecar Combination the War Office is ordering

is the Clyno. "Yesterday"—in the early stages of the War—practically every other similar machine was submitted to official tests—many were ordered and utilised for actual war service, but few were capable of withstanding the rigours of use and abuse that war service entails.

Naturally it became a question of "the survival of the fittest," and the experience of ten months of active warfare is followed by the present sole selection indicated.

That fact is worth remembering and the machine that can so unmistakably demonstrate its merit and superiority—worth waiting for.

Keep in touch with us.

PRICE 1/- net. By post 1/3.

Ear-Witness at the Front.

Overheard at the Front. By CHARLES G. HARPER. 110 pp. Iliffe & Sons. 1s. net, paper.

Mr. Harper possesses the essential qualification for writing a book of this character, a quick observation, a retentive memory, a keen sense of humour, and the ability to make himself at home under strange circumstances and in strange places. In these tales, which are largely in dialogue, Mr. Harper shows us the cheerful soldier, preserving a humorous and cheerful outlook under the most depressing circumstances, and seemingly indifferent to the magnitude of the great struggle in which he and his fellows are bearing their part

I tried one inn at a venture. . . . The place was pretty full of soldiers and tobacco smoke I called for a glass of beer, interrupting a conversation at the bar, in which, as far as I could make out, two of the Worcestershires were vainly trying to make a French girl understand that she was a "bit of all right, an' that's a fact." . . . .

"Tell 'er she's made us love 'er, but we didn't mean to do it. . . . Go on. See what she's got to say about it."

This is a sample, at a venture, of Mr. Harper's amusing experiences.

MILITARY NOTES.

MOTOR CYCLISTS MENTIONED IN DESPATCHES.

AMONG the list of those mentioned in despatches we notice the name of Second-Lieutenant L. S. Smith, Motor Cyclist Section, R.E. Special Reserve. In the *Gazette* we notice Corporal W. N. Gurdon, Special Reserve of Officers, Reserve Units Corps, R.E., Motor Cyclist Section, to be temporary Second-Lieutenant. We presume that this is Corporal W. Gurdon, Motor Cyclist, Meerut Signal Company, 2nd Presidency Volunteer Rifles, who was awarded the D.C.M. "for conspicuous gallantry at Neuve Chapelle for carrying important despatches under fire by day and night, and always with success," whose name appeared in the *London Gazette* of June 3rd.

In the Motor Machine Gun Section are mentioned Captain H. G. Bird (now Major), No. 4 Battery, Reserve of Officers (engaged in the successful operations at Hill 60), temporary Second-Lieutenant J. Clough, and temporary Second-Lieutenant J. R. Farrington.

NEWS FROM No. 5 BATTERY.

J. COCKER, a member of the No. 5 Battery M.M.G.S., in the course of a letter to the Editor, acknowledging receipt of the boxing gloves and footballs sent by the Coventry and Warwickshire M.C., gives some interesting news. He writes as follows:

"I am writing on behalf of the battery to thank you and the Coventry M.C. for the set of boxing gloves. I expect you know that Sergeant W. A. Davenport has left us. He has been in hospital with bronchial pneumonia, but seems to be better now. The battery has been doing trench work for some weeks now, and things are fairly quiet just at present. I get *The Motor Cycle* regularly every week, and it is always in great demand I can assure you. I met E. and C. Williams recently, and we had a long chat over old times. We are all quite well, and as fit as fiddles."

SERGT. DAVENPORT GETTING BETTER.

IN the letter from which we have quoted J. Cocker informed us of the extremely bad time Sergeant Davenport had been having, so that we were relieved to hear from Davenport himself that he is now on the right road to recovery, though still some way off complete fitness. Sergeant Davenport is with the No. 5 Battery M.M.G.S., and before the war was with the Lea-Francis Co., and well known to Scottish and English "Six Days" competitors. The following are extracts from Sergeant Davenport's letter:

"I had a lot of trouble with my foot, and the doctor thought it would be necessary to operate. I came to the base, and while I was down here I fell sick, since when I have been seriously ill with pneumonia. I have been in hospital for almost a month, and I have not been out of bed yet, but I am getting better, and hope to get up shortly. I shall get a sick furlough, which will mean a holiday in Coventry.

"Major Waring, who is second in charge of the hospital here, brings me *The Motor Cycle* regularly, and I can assure you it helps me pass a good many weary hours. Major Waring is the owner of a Sunbeam, and, of course, we have a lot to talk about in the motor cycle line."

SIXTEEN DESPATCH RIDERS SEND MESSAGE FROM THE DARDANELLES.

WE have received the following letter from a group of Manchester motor cyclists now serving as despatch riders with the Mediterranean Expeditionary Force:

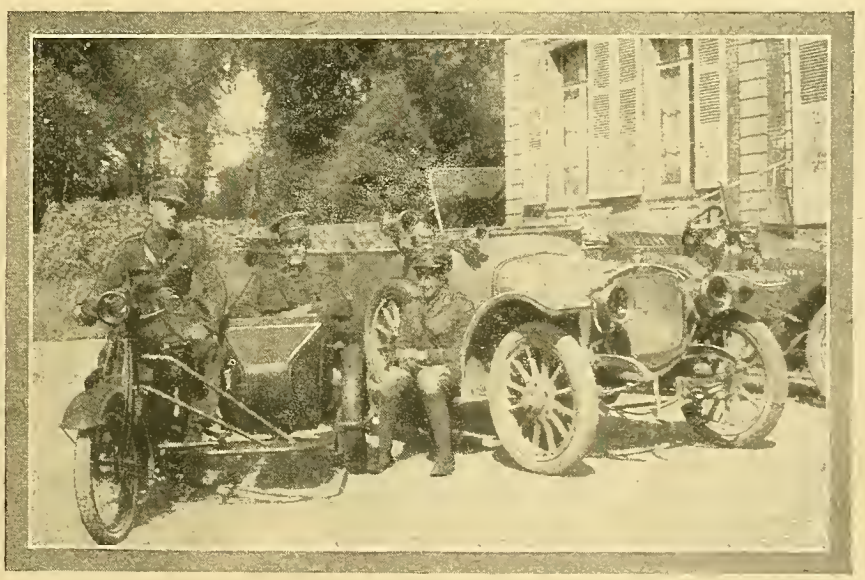
"We have noticed an article by Bernard Rice in your edition of May 20th (page 486), and should like to pass a few comments upon it. He mentions such unknown luxuries in this country as lunch in a farmhouse and beer served by a nice girl. Since landing here such things are sweet memories of the past. He also refers to the unearthly roar of a gun as if it were a rare occurrence. Out here it is one incessant boom, and all our despatches are carried under both shell and rifle fire over broken country where roads are mere tracks

"But these difficulties all add zest to our work, and make us all the keener to uphold the splendid name that motor cyclists have earned in this campaign. We are indeed glad to say that our section is still complete, well and happy, and are longing for the time when we shall be able to exchange experiences with the motor cyclists who are serving in France.—M.O., J.F.S., A.L.S., J.B., T.D.T., W.L.H., R.H., C.F., W.A.T., C.D.M., J.L.Y., J.S.S., F.L., W.W., A.R., P.B."

TRAINING WITH THE M.M.G.S.

THE Editor receives many letters from men he has recruited for the M.M.G.S., which confirm, if any confirmation were needed, the healthy and interesting life led by those in training at Bisley. Not one appears to have regretted joining, and though the work is at times hard it is very enjoyable, and the great desire of all is to get out to the Front. The following letter from Mechanic Alfred Fielder, now at Bisley camp, is typical of many received: "Just a line to thank you for helping me to join the M.M.G.S. I consider my joining about the best thing I have ever done. I have been in the Army now about six weeks, and like the open air life very much; in fact, it is a holiday, but we are being paid for it. The only thing I should like better is to be out in France with the boys, as no doubt we shall soon. I used to be a competition rider for the New Hudson Co., but some of the roads here are worse than in any trial."

"You will be pleased to hear that I like the work very much, and certainly we cannot complain of being overworked. We knock off at 4 p.m., and can do what we like until 9.30 p.m. There is plenty of bathing, and I get a run on my Indian every day."—Extract from letter from Harold H. Bowen, the well-known amateur rider, now with the M.M.G.S.



Second-Lieutenants C. T. Newsome, S. A. Rowlandson, and D. H. Noble, photographed "Somewhere in France" one day last week. Of the hundreds of former trials riders now serving their country, few are better known than this trio. They competed in practically all the big events—Noble and Newsome on Rovers and Rowlandson on a Rudge. In the above picture Noble and Rowlandson occupy the Clyno sidecar outfit, whilst Newsome is seated on the running board of the Sunbeam car.

The War Office and Spares.

In the case of machines ordered for use in the Army, the War Office stipulates that in future spare valves for motor cycle engines shall be fitted in a wooden holder to protect the seat, the valve being held in place by a spring and cotter. Motor cyclists will know that a number of firms have made a practice of sending out their spare valves packed in this manner for some time past.

Second-hand Prices.

We give below the average prices of the various second-hand models offered for sale in the last issue of *The Motor Cycle*, and also the average prices for the last eight weeks. The prices quoted may be regarded as their standard value.

Magneto Position.

So much interest having been taken in the British-made magneto, the position of British magneto manufacturers is outlined in the present issue, and the progress recorded since our last reference to the subject.

Obtaining a Recruit.

A native of Ceylon, who had been contemplating the purchase of a motor cycle, happened to see in a street in Colombo a scrap of paper with a picture of a machine on it. The paper turned out to be a page, torn from *The Motor Cycle*, containing an advertisement of the Hobart, the result being that the man sent an order to the Hobart Bird Co. for one of their 2¾ h.p. machines.

A.A. and M.U. Notes.

LOCAL LIGHTING REGULATIONS FOR SIDECARS.—In these days of reduced lights on motor vehicles, it should be noted that in certain places where bye-laws are existent, rendering it compulsory for three and four-wheeled motor vehicles to show two white lights to the front, summonses are being taken out against motorists who omit to carry the additional light.

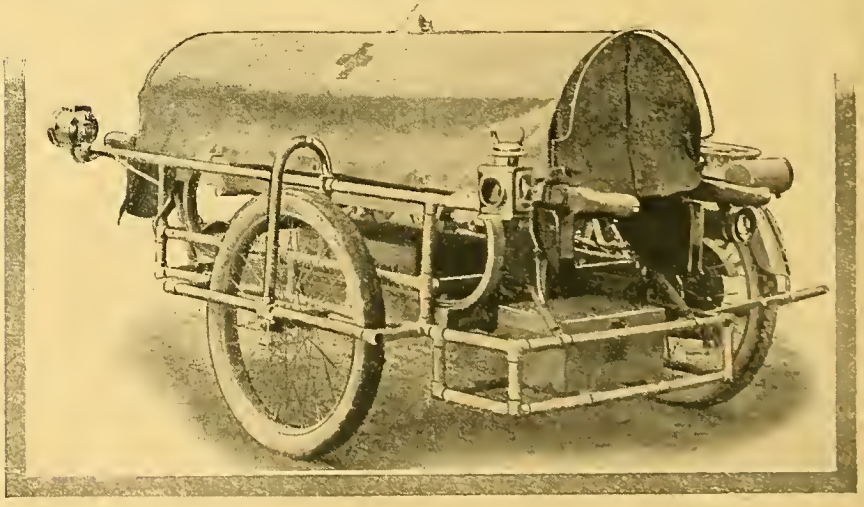
The following are the counties and towns in which there is an obligation upon motorists to show two white lights to the front, the lamps to be situated one on either side of the machine. The places are: County Councils of Glamorganshire and Staffordshire, Town Councils of Neath, Merthyr Tydfil, Hanley, Dudley, Newcastle-on-Tyne, Stafford, Monmouth, and Birmingham (the latter only during fog).

EXCESSIVE SPEED WARNINGS. — The authorities at Hucknall Torkard, Notts., have communicated with the Automobile Association with regard to the excessive speed at which numerous motorists pass through this district. The local authorities are reluctant to take drastic steps, but they feel it their duty to protect the public interests. They, however, hope that this warning will prevent any necessity for action by the local police.

Complaints have also been received by the A.A. regarding the speed of motor vehicles travelling through Horley (on the Brighton Road), and as accidents have resulted the authorities are being approached to take strong action against drivers travelling in this district at excessive speed.

SPECIAL FEATURES.

THE BRITISH MAGNETO SUPPLY.
A CHAIN GEAR BOX.
MILITARY MOTOR CYCLING MATTERS.



Improved pattern sidecar ambulance designed by Mr. T. H. Henderson, Superintendent of the St. John Ambulance Brigade, Randwick Division, New South Wales. It is mainly intended for city accident work, and many, we are told, have already been put into service. The bicycle is a 7-9 h.p. two-cylinder American Pope. Great attention has been paid to the suspension, and the tyres are 700 × 85 m.m.

Features of This Issue.

An exclusive illustrated description of the Irish open twenty-four hours trial appears in this issue, as also the week-end doings of the Midland Motor Cyclists Volunteer Corps—a week in advance of other journals.

A Spanish road race which resulted in a British victory is also illustrated and described, in addition to our regular features and other special articles.

Suggested Race for Officers at Brooklands.

An officer writes suggesting that there should be motor cycle races at Brooklands for the many officers now quartered in and around Aldershot and in the Brooklands district. The writer mentions that he has many officer friends who would compete.

We are afraid that the present condition of the track would render long distance events impossible.

The War Funds.

Continuing our practice of quoting some of the war funds, we may mention the following totals at the beginning of the week :

Daily Telegraph Belgian Fund	£148,599
Queen's Work for Women Fund	£160,207
National Committee for Relief in Belgium	£442,000

The Despatch Riders' Section.

We recently met Sergt. Albert Milner, the Birmingham motor cyclist, who will be recalled as an expert trick rider on a sidecar and Levis motor bicycle. Milner enlisted with F. C. North (the Ariel rider) and H. R. Davies (of Sunbeam fame) last autumn, but having experienced a fall and consequent trouble with his knee-cap, was detained in England, and is now at the Signal Depot, where despatch riders are trained. In charge of his section is Lieut. Busby, and a fortnight ago Sergt. A. J. Sproston took up his duties at this centre. As may be imagined, the despatch riders' training centre is a hive of activity. There is an over-abundance of applications for service in this section, and men are often on the waiting list for weeks.

An American Reliability Trial.

Californian motor cyclists have recently held a 640 miles reliability trial of a most gruelling nature, mainly through the burning, shifting sands of Southern California. Twelve competitors faced the starter at Los Angeles, and seven finished to schedule time on the following day. The temperature throughout the run was in the neighbourhood of 120°. The seven riders who made perfect scores were mounted on the following makes : Harley-Davidson (1), American Excelsior (3), Henderson (1), Indian (1), and Thor (1).

Belgian Government and Motor Cycles.

H. G. Bell, formerly of F.N. (England), Ltd., is now temporarily in the service of the Belgian Government. We had the pleasure of meeting him in the Midlands last week, whither he had journeyed in connection with orders for cycles and motor cycles for the Belgian Army.

The 500 c.c. Records.

There was a slight error in the figures sent to us in connection with the recent record made by Lavanchy on the 3½ h.p. Motosacoche. His best time for the kilometre was given as 27⅘s., whereas it should have been 27⅖s., which just beats O'Donovan's Brooklands record made last year. Recent records for the flying kilometre are as follows :

O'Donovan (3½ Norton) 27.6s. (81.1 m.p.h.)

Lavanchy (3½ Motosacoche) 27.4s. (81.6 m.p.h.)

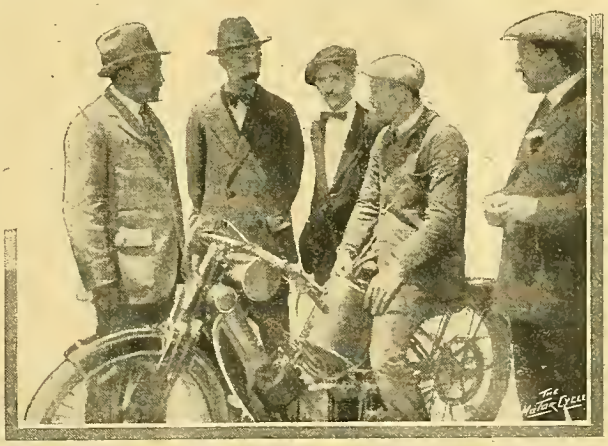
O'Donovan (3½ Norton) 27s. (82.8 m.p.h.)

Motor Cycles used in the Italian Army.

We mentioned last week the fact that the Italian authorities are alive to the value of the motor cycle in warfare, as are the British authorities, and we now hear that most of the racing men, including Baj Badino (the well-known Douglas rider), Cerizza, Guzzi, Scotti, and Monti, are at the Front. Since mobilisation the Italian Government has bought up practically all the motor cycles over 3 h.p. considered suitable for war service. The four most prevalent types are British-made machines, viz., Triumph, Rudge, Sunbeam, and Lea-Francis. Among the sidecars which are used for the transport of officers, the Motosacoche and 7 h.p. F.N. are pre-eminent. The purchases included private owners' machines, and the price in each case was fixed by a Commission of motor cycle experts and officers. Among the experts were several well-known sportsmen of the Moto Club Italia, and their ruling gave entire satisfaction. The machines thus obtained were used in the formation of a motor cycle corps which is established in Monza, together with the Automobile Corps.

Independent of this section are the Volunteer Motor Cyclists, who use their own machines, and are now being instructed in Gallarate.

With the big demands for motor cycles made by the Italian Government, it will occasion no surprise to learn that there is a scarcity of motor cycles at present, and it is unfortunate that British manufacturers are not in a position to take advantage of it.



The Spanish 130 miles road race. Discussing events with the winner, M. Lliviria, who rode a Scott. He did not use goggles, and averaged forty-five miles an hour. (See page 16.)

Lightweights in America.

No doubt influenced by the progress in England, America is now turning her attention to the lightweight motor cycle. The bad roads in the States have delayed the production of the smallest and lightest power propelled two-wheeler.

Stolen Machine.

A 1911 Triumph motor cycle, engine No. 1,319 B11, Stelastic tyre on rear wheel, Dunlop on front, free engine, was stolen from Stephenson Place, Birmingham, last Saturday. The owner, Mr. F. E. Tims, 146, Wheelwright Road, Erdington, offers £1 reward for information leading to its recovery.

Sauce for the Gander.

A superintendent of police appeared last week at the Stroud Police Court charged with having driven a motor cycle in a dangerous manner. The evidence was very conflicting. The prosecution alleged that the motor cycle had been driven "very fast," while the defence estimated the speed at from two to four miles per hour. From what we know of police estimates of pace, we should therefore be inclined to divide by the usual factor and to place the speed at ½ m.p.h. The defendant said that he rode out of George Street at a speed slower than a man could walk! A fine of 10s. was imposed.

The Road Board.

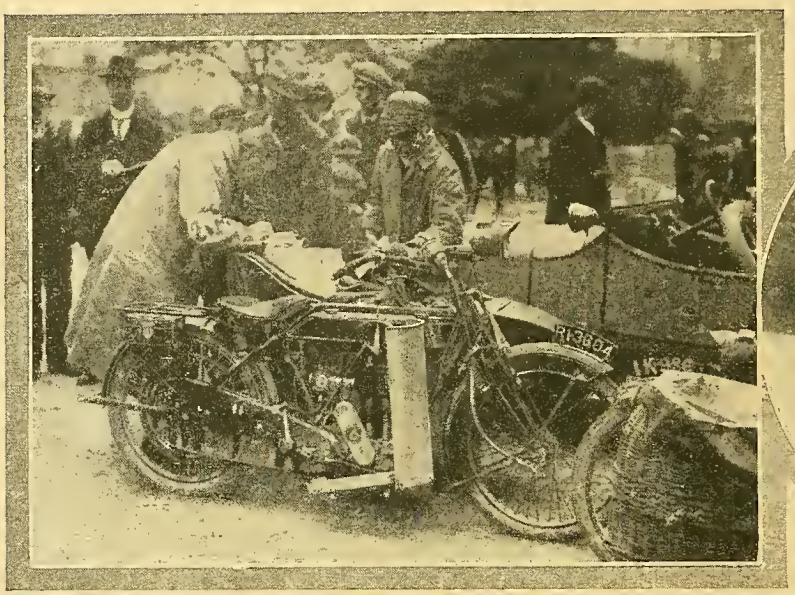
In opening the County Councils' Association Exhibition of road materials and machinery and appliances for road construction at the Royal Horticultural Hall, Westminster, on Friday last, Mr. Walter Long passed some remarks on the need for reform in traffic control. He also criticised the Road Board's practice of stipulating, when making grants to urban and county authorities, that the authorities themselves should bear portions of the costs entailed for the work in hand. In this way, said Mr. Long, ratepayers found at the end of a year or two that, though millions had been paid from the Exchequer, there was no relief from their burdens because of the demands accompanying the gifts.

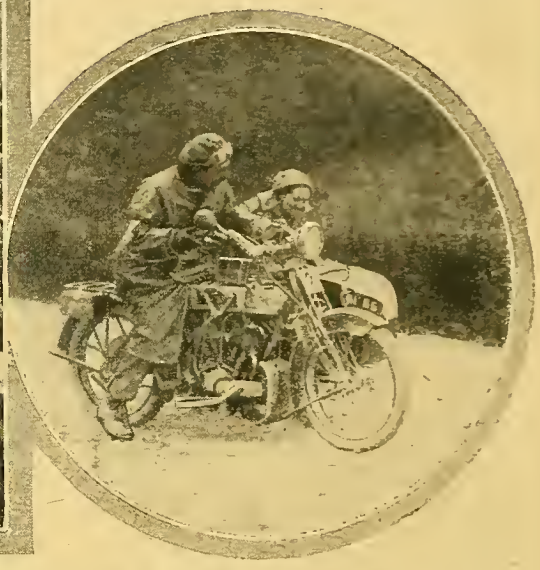
Camping Holidays.

Military camps have absorbed most of the young and able-bodied male members of the Amateur Camping Club, but the club's flag is kept flying by the ladies and the veterans, and the first of a series of holiday camps is being held this week at Cropthorne, near Pershore, a convenient centre for Shakespeare's Country. On Saturday the tents will be pitched at Symond's Yat, on the Wye, and then for consecutive weeks the camping centre will shift to Llangollen, Chelford, Grasmere, Windermere, Ullswater, Hexham, Ilkley, and "somewhere in Derbyshire." The club's headquarters are at 4, New Union Street, Moorfields, E.C.

Irish Open Twenty-four Hours Trial.

35 Starters—29 Finish within Time Limit. Only 8 Clean Ascents of Glengesh Hill.





There were several sidecar outfits in the Dublin and District M.C.C.'s trial, and in some cases the passenger was a lady, as shown in these two pictures. (Left) W. H. Allen (3½ h.p. Sunbeam and sidecar) signing the sheet at a control. (Right) A. W. Mooney (6 h.p. Bradbury and sidecar) finds Glengesh a stiff proposition.

THE open twenty-four hours trial of the Dublin and District Motor Cycle Club received a very fair measure of support considering the existing state of affairs. The event took place on Friday and Saturday last, and every one of the thirty-five entrants were sent away at one minute intervals from Drumcondra Bridge from eight o'clock onwards. The Cork Club reciprocated the support given to their open "twenty hours" at Whitsuntide by sending up half a dozen competitors.

Climbing Glengesh Pass.

The trial, as in previons years, was a 400 miles run to Donegal and back, and Glengesh Pass—the steepest hill to be found on any main road in Ireland—was the crucial part of the test. It was a condition necessary to the winning of a first-class award that a clean ascent of the hill should be made at the first attempt, a secondary one being that the rider should not lose more than ten marks at the open controls. We may anticipate by saying that of the twenty-five competitors who got over the hill only nine made clean ascents—eight solo machines and a cycle car—and as amongst those who ranked as failures were included experts of the class of C. B. Franklin and A. W. Mooney, it can well be imagined that the conditions were very unfavourable. Glengesh has never been publicly climbed by a 3½ h.p. machine and sidecar, and this year it was in a worse state than ever. Not one of the sidecars went round the first of the hairpin bends under its own power, and most of the singles that did so immediately came to grief through the combination of surface and gradient. It was universally agreed that the hill was in much worse condition than on the occasion of any previous trial, chiefly owing to the long spell of dry weather preventing the new metal and earth that were spread on the road in the spring becoming consolidated.

The Starters.

The weather conditions gave promise of a very agreeable time as the men were sent away from Dublin. Previously their toolbags were sealed at Wallen's Garage, repairs, adjustments, and breakages *en route* being penalised. J. Brown led the way on his Rover at eight o'clock, and at one minute intervals the field was despatched in the following order:

J. Browne (3½ Rover)
A. W. Mooney (6 Bradbury sc.)
P. Grimes (5 Indian)
T. Woods (4 B.S.A.)
W. J. Henderson (7-9 Harley-Davidson sc.)
E. J. Jack (3½ Rover)
J. Doleman (3½ Rover)
J. F. A. Day (3¼ Sun)
D. Allen (2¼ Sun)
C. S. Kettle (4 B.S.A. sc.)
M. English (2¾ Douglas)
F. L. Dooly (4 sc.)
W. H. Freeman (7-9 Indian)
G. Hartigan (3¾ Scott)
C. B. Franklin (7-9 Indian sc.)
T. Toole (4 B.S.A.)
W. W. Wayte (7-9 Harley-Davidson sc.)
Geo. Rocho (3½ Rover)
J. C. Cunningham (4 Bradbury)
H. W. Allen (3½ Sunbeam sc.)
C. Taylor (3½ P. and M.)
T. W. Ladd. (4 Bradbury)
J. O'Dwyer (4 B.S.A.)
A. J. Winstanley (3½ Zenith)
R. Walshe (4 B.S.A.)
R. Swanton (3½ Indian)
F. J. Travers (5 Indian)
J. J. White (2¼ Sun)
R. Sullivan (5 Indian)
D. S. Dick (2¼ New Hudson)
D. Doolin (10 A.C. c.c.)
J. M. Gardner (Lagonda c.c.)
R. Chambers (6 New Hudson sc.)
A. Blair (3¾ Scott)
D. Parbury (7-9 American Excelsior)

In the first section of 101 miles to Belfast there was only one check, viz., at Dunleer, and Belfast was reached by the early arrivals at one o'clock, an hour being allowed for supper. There were few missing at this control, but amongst them was the holder of the Rudge-Whitworth Cup, Henderson, who won it last year on a 5-6 h.p. Rudge solo, and who was this year on a 7-9 h.p. Harley-Davidson with sidecar. He was in tronble before the dawn came owing to the loss of a high-tension terminal. A. W. Mooney came in with his wife on the carrier, having picked up a man who had been involved in a motor car accident ontside Belfast.

Dawn came before the last of the men left Belfast for Londonderry, a fortunate circumstance, for the run across took the men over the Glenshane Pass, a crossing of the Spern Mountains in Co. Tyrone, that presented sufficient difficulties without the added terrors of darkness. Most of the men made clean ascents. It was one of the three non-stop sections of the trial, and the only one on the first half of the journey. There were many cases of mysterious overheating, due to the fact that the hill rises imperceptibly for a considerable distance before the actual Pass is reached. Most of the men were on time at the breakfast control at Londonderry. D. S. Dick, who had the pluck to start on a single-geared two-stroke New Hudson, was amongst the late.

A Trying Run.

The journey across the Co. Donegal to Glengesh Hill was a very trying one, the roads being in an appalling state of looseness. Those who met with no trouble were only able to average twenty miles an hour by going all out, and those who punctured—a very common experience—could not pick up time. At Ardara, the town at the foot of the hill, there was a fifteen minutes stop, and it was noted that there was little of the usual waiting outside the town to kill time.

Irish Open Twenty-four Hours Trial.—

Clean Ascents of Glengesh.

The climb over Glengesh reduced the possible number of gold medal winners to nine. The eight solo riders who made clean ascents were :

J. C. Cunningham (4 Bradbury)
W. H. Freeman (7-9 Indian)
E. J. Jack (3½ Rover)
J. Doleman (3½ Rover)
T. Toole (4 B.S.A.)
R. Walshe (4 B.S.A.)
G. Hartigan (3½ Scott)
R. Swanton (3½ Indian)

The only passenger-carrying machine to make a clean ascent was D. Doolin on a 10 h.p. A.C. light car, but he lost the possibility of gaining a gold medal by having to stop to repair a puncture in the non-stop section, which ran on to Donegal. Every sidecar machine failed before the first of the two hairpins was reached. Most of the singles also failed to get around the first corner. This was altogether due to the state of the surface, which was admittedly abnormally bad, as, while the hill is a very severe climb, it is not an impossible one, as is evidenced by the fact that two years ago T. E. Greene got up on a single-geared 3½ h.p. Rudge, and last year, in the trial, Hugh Gibson took a 2¼ h.p. Clyno two-stroke over it. Indeed, many of those who failed on Saturday were successful in previous years on similar machines, A. W. Mooney being a case in point.

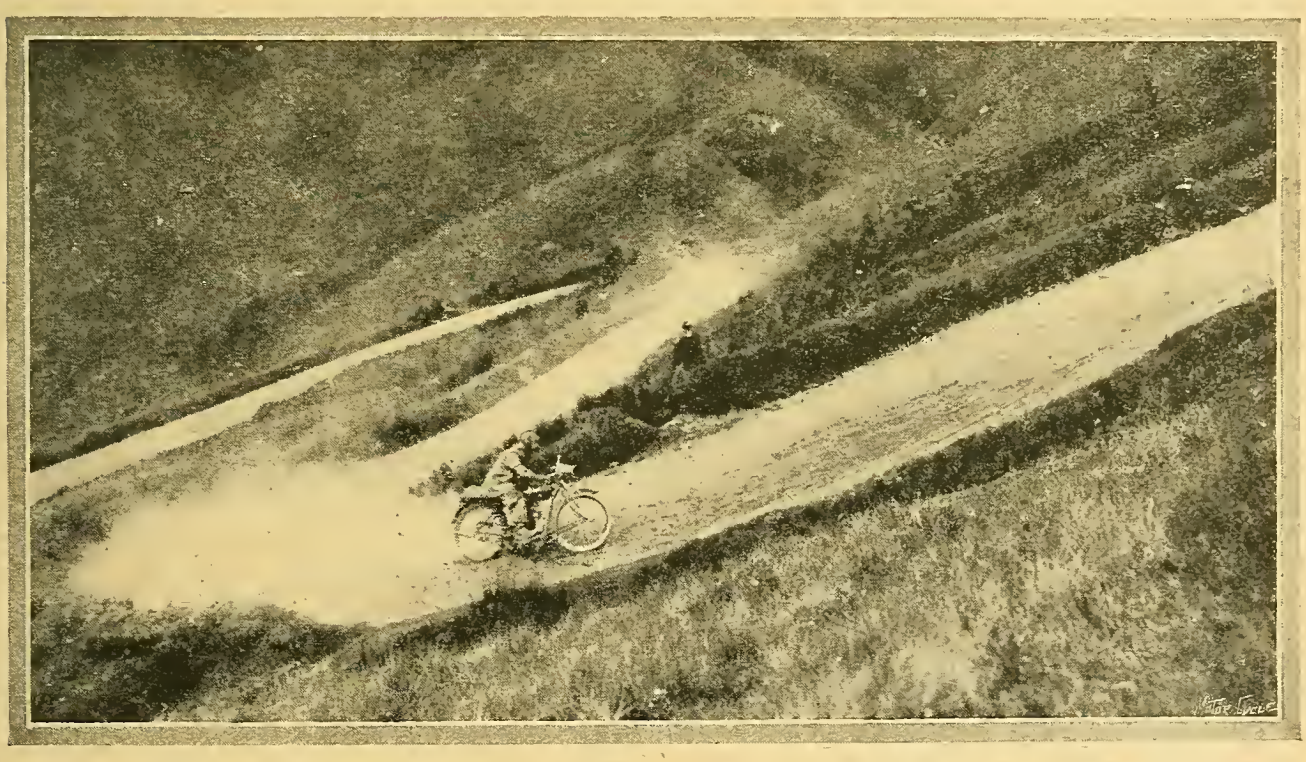
There was some lively scurrying across the country to the Donegal control, but twenty-five of the thirty still in were on time or near it when the luncheon stop was reached. After an hour's delay, the third and final non-stop section to Enniskillen was entered on, but the surfaces gave more cause of complaint than the gradient. Rain commenced to fall before Cavan was reached for tea, but from that point onwards to the finish good roads were traversed, and all of those who checked in at the last open control completed the sixty miles to Dublin with the exception of Blair (3¾ h.p. Scott). Freeman and Franklin fell asleep on the way and found the ditches, but otherwise there was no incident of note. There were two secret checks in this section to assist in the possibility of finding a winner in the event of a tie.

Finishers to Time.

The following completed the trial within the allowed margin of 30m. of the scheduled time :

J. Browne (3½ Rover)
A. W. Mooney (6 Bradbury sc.)
P. Grimes (5 Indian)
T. Woods (4 B.S.A.)
E. J. Jack (3½ Rover)
J. Doleman (3½ Rover)
J. F. A. Day (2½ Sun)
D. Allen (2¼ Sun)
M. English (2¾ Douglas)
F. L. Dooly (4 B.S.A. sc.)
W. H. Hartigan (3¼ Scott)
C. B. Franklin (7-9 Indian sc.)
T. Toole (4 B.S.A.)
Geo. Roche (3½ Rover)
J. C. Cunningham (4 Bradbury)
H. W. Allen (3½ Sunbeam sc.)
C. Taylor (3½ P. and M.)
T. W. Ladd (4 Bradbury)
J. O'Dwyer (4 B.S.A.)
A. J. Winstanley (3½ Zenith)
R. Walshe (4 B.S.A.)
R. Swanton (3½ Indian)
F. J. Travers (5½ Indian)
J. J. White (2¼ Sun)
R. Sullivan (5 Indian)
D. Doolin (10 A.C. c.c.)
J. M. Gardner (Lagonda c.c.)
R. Chambers (6 New Hudson)
D. Parbury (7-9 American Excelsior)

Henderson retired near Dundalk; Kettle was run into by another competitor and his sidecar broken; Wayte retired at Glengesh; Dick was not reported after Londonderry; and Blair unfortunately had to retire on the last section of the journey.



The double hairpin corners on Glengesh Hill—the *picce de resistance* of the Irish twenty-four hours trial. Just as this photograph was taken an Indian rider had tackled both corners successfully.

DEFINITION OF A CYCLE CAR—IRISH SOLUTION.

AT a recent conference between the Irish Automobile Club and the Motor Cycle Union of Ireland concerning the control of cycle car competitions in Ireland, it was decided to retain the 7 cwt. weight limit, but such weight is to be exclusive of hood, screen, spare wheel, oil, and petrol. The engine limit is still 1,100 c.c.

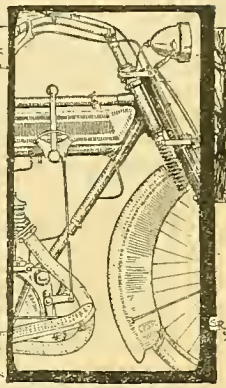
It will be within the memory of most of our readers that the R.A.C. and the A.C.U dropped the weight limit altogether about eighteen months ago. At the time we advocated reducing the engine limit to 1,000 c.c. also, but this part of our suggestion was not adopted, the present A.C.U. definition of a cycle car being simply that the engine capacity is not to exceed 1,100 c.c. Thus, such well-known vehicles, built on strictly large car lines, as the Stellite, Morris-Oxford, Standard, Singer, and many others, are, according to the A.C.U., cycle cars.

This new move on the part of our Irish friends does not appear to be a forward one. In all competitions, excepting purely speed events, it is very uncommon to find a competing car minus hood and screen, so that competitors in Irish events will, before having their cycle cars and light cars weighed, have to take off hood and screen, and empty the petrol tank. In a big open trial trade drivers will not worry about details like these, but it will not encourage the private owners.

BI3

A Road Race in Spain.

Scott Rider wins at an Average Speed of 45 m.p.h.



WITH threequarters of Europe engaged in the bloodiest struggle in history, and motor contests consequently things of the past, it is quite a relief to hear of a road race for motor cycles held recently in Spain. Until within a couple of months ago our Italian friends ran some occasional trials, but now that they have joined the Allies, competitions with them are out of the question, practically all the well-known riders being either in the Army or engaged on some kind of Government work.

This Spanish race was organised by the Motor Club of Madrid, and, compared with previous events, it appears to have been indeed a severe test. The total distance was 206 kilometres, or 130 miles, and there were many hairpin corners, besides the crossing of two mountain ranges. On each side of the latter the gradient, of an average of 12%, extended for about ten miles. A continuous ten miles climb at racing speed on a hot day is a good test.

SCENES IN THE SPANISH ROAD RACE.

(Upper) The Scott team, showing the winner, M. Lliviria, on the right.
(Middle left) A Motosacoche rider rounding a bend.
(Middle right) Victor Landa (T.T. Rudge Multi) third to finish, just after passing the timekeepers.
(Lower) Rippolez, one of the Scott riders, starts on the second lap.

Competitors were divided into three classes, the engine limits being 300 c.c., 500 c.c., and unlimited. The winner, M. Lliviria, rode a Scott, and covered the total distance in 2h. 52m. 1s. (=45.25 m.p.h.) The first dozen finishers arrived in the following order:

Lliviria (Scott).
Landa (Indian).
Landa (Rudge).
Cardenal (Indian).
Adariaga (Scott).
Santoyo (Scott).
Rippolez (Scott).
Manzarraga (Indian).
Pidal (Indian).
Rudernos (Indian).
Rivera (Indian).
Azqueta (Indian).

Dunlop tyres appear to have been used not only extensively but successfully, as riders of machines so fitted filled the leading places in each class.

Midland Motor Cyclists' Volunteer Corps.

THE WEEK-END AMBULANCE PRACTICE.

CORPS drills in connection with the team displays took place every night during the past week. On Saturday next the men will give a military display in aid of the Birmingham charities. This is the first occasion that a display of a military nature by motor cyclists has been given.

On Sunday the corps paraded for a field day. The corps was divided into troops under the officers, each troop having its own duty to carry out. A Troop came in off patrol and camped for the night, throwing out a screen of vedettes and outposts. These were driven in by B Troop, who made an attack on the camp, which was repulsed.

B Troop now attempted to force a despatch rider through to their reinforcements, represented by C Troop. The despatch rider was captured, and A Troop also sent out a despatch rider to their main body, represented by D Troop.

Ambulance Work.

It was assumed that a number of men had been wounded and left on the field. The ambulance section now came on the scene, but before the ambulance could become effective it was not only necessary to beat off the enemy, but also to bring in the wounded men.

Riders now went out and picked up the wounded men, placed them on their backs, mounted, and brought the wounded in—a smart piece of work.

The enemy had now retired, and the ambulance was sent out. The corps has stretchers attached to the sidecar punt. The sides of these stretchers can also be used as punt poles when joined together. First aid was given, and the men treated in a satisfactory manner.

An outpost section of the M.M.C.V.C. in action.

The whole corps was shortly afterwards assembled, and a route march to Birmingham ended a useful day's work.

THE UTILITY OF MOTOR CYCLISTS IN WAR.

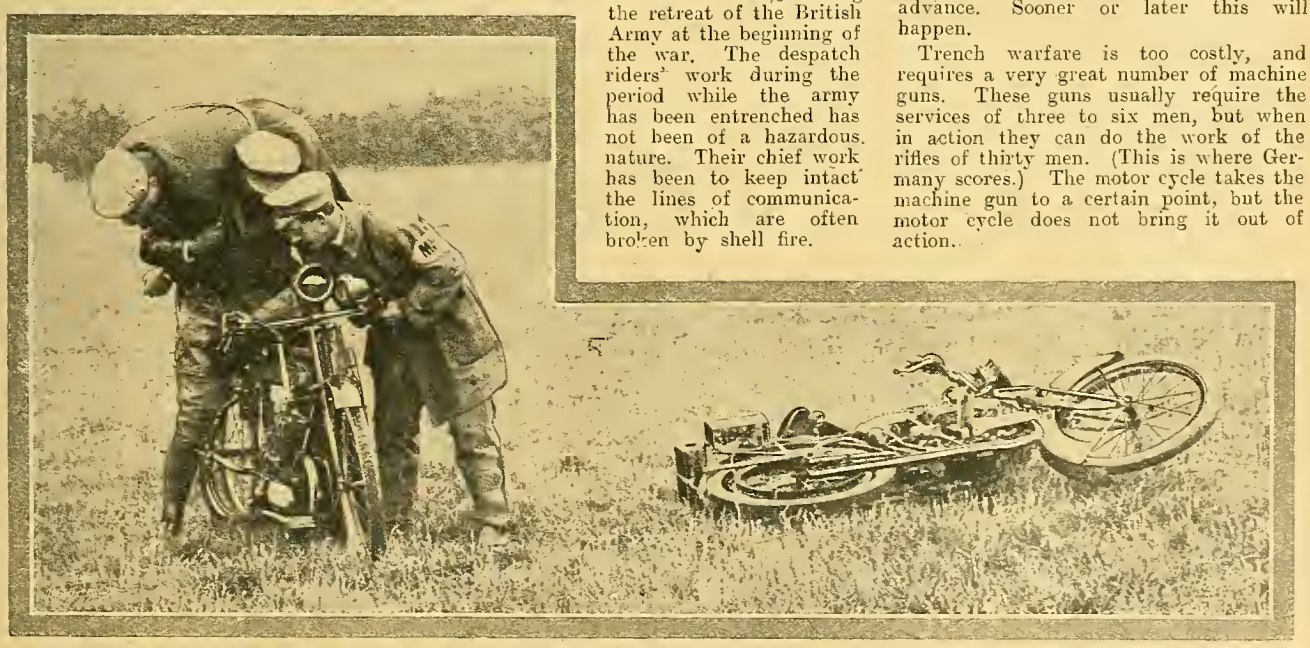
The Commandant, commenting on the utility of motor cyclists in the present war, expressed the opinion that the motor cycle could serve a purpose equally as useful in war as in the time of peace.

The Motor Cycle states that 75% of the work done by despatch riders is by no means dangerous. Possibly this is correct, but this figure was in the neighbourhood of 20% during the retreat of the British Army at the beginning of the war. The despatch riders' work during the period while the army has been entrenched has not been of a hazardous nature. Their chief work has been to keep intact the lines of communication, which are often broken by shell fire.

The machine gun is also brought to a point near the fighting by motor cyclists. Seldom are the drivers under fire when running along the road. Usually the motor cycle and gun chassis are left a mile or two behind the first line trench. The guns are mounted on tripods. Therefore it is apparent that under the existing conditions the claim of 75% of work done is not dangerous is a reasonable statement.

Against this, as *The Motor Cycle* points out, much depends on the man's temperament. Many men doubtless consider they are constantly doing dangerous work. They are perfectly correct, but not the hazardous duty which will be required of them when the Allies advance. Sooner or later this will happen.

Trench warfare is too costly, and requires a very great number of machine guns. These guns usually require the services of three to six men, but when in action they can do the work of the rifles of thirty men. (This is where Germany scores.) The motor cycle takes the machine gun to a certain point, but the motor cycle does not bring it out of action.



AMBULANCE PRACTICE. Two members of the Midland volunteers bringing in a wounded comrade from the field of battle.

After the day's work—yarns round the camp fire. A scene at last week-end manœuvres of the Midland Motor Cyclists' Volunteer Corps.

What can trained motor cyclists do when the Allies advance? Their mobility gives them possibilities which no other arm of the service, except aircraft, possesses. They make ideal mobile scouts. During the advance motor cyclists could be employed as reconnoitring patrols, co-operating with units of the machine gun sections. Bridges, stations, and villages could be seized and held until the slower-moving units have had time to come up. Mobility also enables motor cyclists to be of very great service to the Royal Engineers, assisting in their demolitions and constructions, laying of cables, and keeping the lines of communication.

Their mobility gives them an advantage over cavalry, hence their value to the Headquarters Staff, Divisional and Brigade Commanders is great. The despatches entrusted to them can be delivered more rapidly and over greater distances.

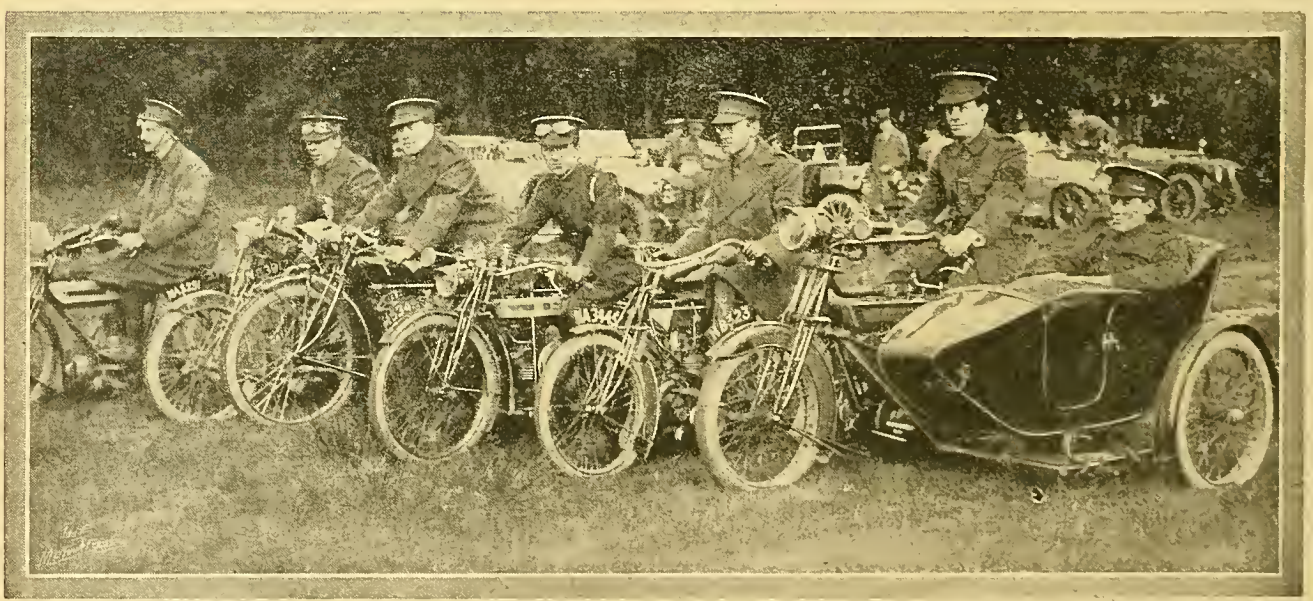
The artillery units often require information of various positions, etc. Usually the O.C. requires the information quickly. Here again motor cyclists can be very prominent.

Acting with the corps which has the advantage over them in mobility—the Flying Corps—the motor cyclists' utility would be great. They could give assistance in conveying information from the aircraft to headquarters, establishing new bases, keeping up communication, and many other important duties.

The motor cyclists' part in a retreat (the Commandant gave it as his confident opinion that it will not occur again to the Allies in the present war) would be to destroy, or rather to assist in destroying, bridges, railways, and other positions, and thus hamper the enemy.

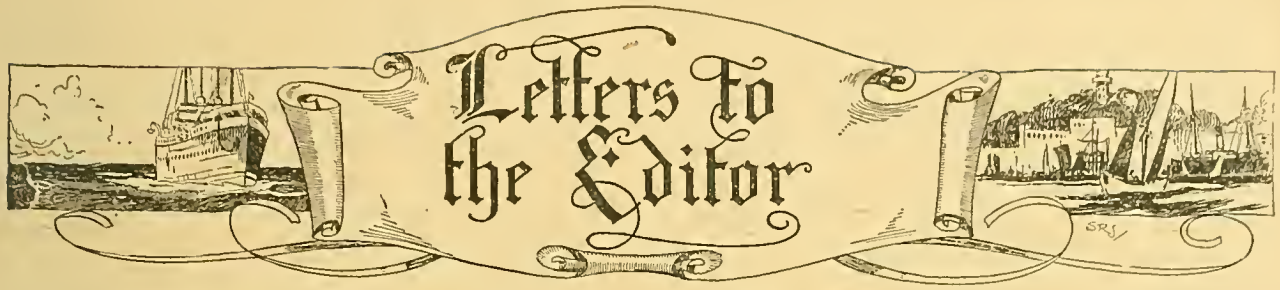
The motor cyclist can co-operate with all arms of the Service, but to serve the purpose intended, he must be a trained man. His training would be one which requires the highest intelligence; in fact, greater than that required of any other arm of the Service. The courage required of him would also be above the average.

The motor cyclist, therefore, will have ample opportunities to gain the premier award in this world's competition—the V.C.



THE NATIONAL VOLUNTEER MOTOR RESERVE.

Motor cyclists attached to the Manchester Section. The picture was taken at Tatton Park, Lord Egerton's estate, near Knutsford, which is lent to the Manchester Volunteers for week-end drills.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Freak Hills in Derbyshire.

Sir,—It may interest readers to know that Hunger Hill, Cathole, was climbed both by Mr. Waddington, of Chesterfield, and myself, each with 3½ h.p. engines with sidecars, and passengers approximately weighing 28st. I might also add that the hill was in much worse condition then than at present. I should have loved to have been with the party when making their attempts, as I have had some enjoyable hours' sport on Hunger in company with other freak climbers.

JACK HASLAM.

Fitting a Sidecar.

Sir,—A week or two ago I read an article in *The Motor Cycle* on tho fitting of sidecars, in which the writer contended the sidecar wheel should be about two to three inches in front of the back wheel. Since then I have seen an article in a contemporary in which it is stated that the axes of the two rear wheels should coincide.

As this is a matter which is of great interest to me, and no doubt to thousands of other sidecar riders, I think it would be very instructive to have a discussion, with your permission, on the correct position of fitting a sidecar to a motor cycle.

GEORGE E. RIGBY.

Clubs and the War Loan.

Sir,—With regard to the new War Loan, I should like to make a suggestion to the motor cycle clubs, many of whom have considerable funds in hand, and which at the present time are not being made use of, viz., to invest the cash in the War Loan. This will realise a better interest than can be obtained on a deposit account, and at the same time the money will always be readily accessible when wanted after the war. In addition to this, club officials will have the satisfaction of knowing that they are able to further even in a small way the complete success of the War Loan.

N. T. DOWNS.

[We must say that the suggestion made above strikes us as a particularly happy one.—ED.]

The Boycotting of German Motor Cycles.

Sir,—The response to my invitation for support in organising an anti-German boycott has been gratifying, although the actual number of letters I have received on this subject is but a small proportion of the total number of British motor cyclists. It was clear to my committee, however, at their last meeting that there is every probability of "Britisher's" proposals being successfully carried out, but it was felt that sentiment alone would not be sufficient to ensure their success. It is hoped that a conference will shortly be arranged with the Manufacturers' Union, and that as a result some practical scheme will be evolved whereby manufacturers and retailers can be protected from unwittingly dealing in German goods and the production of British substitutes encouraged. In this connection Mr. Hunt's excellent suggestions should be a considerable help, and much could also be done by the vigorous enforcement of the Merchandise Marks Act, which at present is in many ways a dead letter.

"Britisher's" proposal to enrol all the motor cyclists of the country for this specific purpose in the Auto Cycle Union for a nominal subscription shall have my committee's careful consideration, but there must be no suggestion that the A.C.U. is actuated by self-interest, whilst I would remark that the present subscription is, in fact, a nominal one!

T. W. LOUGHBOROUGH, Secretary A.C.U.

Sir,—With regard to the further communication in the issue of *The Motor Cycle* for June 24th under the signature of "Iddo," this gentleman is entirely wrong in stating that the patents of the N.S.U. do not apply to the 3½ h.p. and 6 h.p. engines. Certain of the patents which we have obtained possession of are used on both the 3½ h.p. and 6 h.p. twin, therefore the same applies whether a maker attempted to manufacture a 2 h.p. unit or a 6 h.p. unit. We are aware that there are other patents on the 6 h.p. unit which we have not attempted to conserve, but that will not have any bearing on any maker attempting to use patents used on the whole of the range of N.S.U. motor cycle engines of which we are the owners for the time being. As regards the second paragraph of "Iddo's" letter, really there is very little difference in the two engines. The wearing parts of one are interchangeable with the other, the only radical alteration being that, instead of fastening the engine to the frame by means of lugs cast on to the engine, we have reverted to the better liked type of plate fastening.

HUMPHRIES AND DAWES, LTD.

Plagiarism.

Sir,—Being a lover of British fair play, I think it only just and right to let you know that a local newspaper—*The Evening News*—has, for some time past, acquired the habit of copying paragraphs from *The Motor Cycle* and presenting them to the motoring public as being "specially written for *The Evening News*."

The offence is aggravated by the fact that the newspaper in question is incorporated with the (morning) "Press"—the acknowledged Government organ here—which has, until recently, shown anything but a friendly spirit towards "motor hogs" (the editorial pet name for motor cyclists). Latterly the management of the above journal has begun to realise that "motor hogs" form a very considerable section of the reading public, hence the inauguration of "Motor and Motor Cycling Notes."

The Motor Cycle paragraphs are cunningly worked into the body of the "notes," and not the slightest indication of their origin is given. I send you an example.

Christchurch, New Zealand. DISGUSTED.

[The cutting sent is actually word for word from *The Motor Cycle*.—ED.]

Collisions at Cross Roads.

Sir,—I note in the last issue of *The Motor Cycle* there is a reference to my accident at Tamworth on the previous Saturday. I write to you as there is something to be said on my side of the affair. Here was a cross-road, no warning posts, high hedges, and narrow roads. The hedges were so high that I noticed that unless it was a large covered car one could not see it over the hedge. The road I was on had a slight turn in it, and till I was twenty yards away I could not see the cross-road. I immediately applied my brake and blew my horn, but, owing to the high hedges, neither of us heard each other. I have written to the police at Tamworth suggesting that they should urge that danger posts be put up. I am an experienced motor cyclist, and have ridden for some years, and have already done 7,000 miles this year. Having a week-end leave I was riding from Winchester to friends in Cheshire to enjoy it.

Please insert this in your paper if there is room, as it may warn others of these cross roads. They are at Bonehill farm, off the Coventry road. I shall soon be on the road again.

FX 2563.

The Cost of Running.

Sir,—As a regular reader I have been much interested as to the details of "Running Costs," recently discussed in *The Motor Cycle*, and think you may be interested in the following particulars of a 3½ h.p. machine, which has been used in all parts of the country and in all weathers since June, 1913, and which I have now sold (in splendid condition) for considerably more than half its original cost! (The machine is a 3½ h.p. 1913 clutch three-speed Premier.) Total mileage 9,945.

Running Expenses.			
Petrol, 112¾ gallons	£10	9	9
Oil, 5½ gallons	1	9	8
Licences	3	15	0
Insurance	5	17	0
Law costs	3	2	3
Tyres, tubes, and belts	5	18	0
Lamps	1	15	0
Automatic pump		15	6
Overalls	1	0	0
Sundry repairs	11	5	0
Depreciation	25	0	0
Total	£70	7	2

This works out at a running cost of ¾d. per mile for petrol and oil. With depreciation the total cost works out at just over 1½d. per mile. No longer can it be said that motor cycling is expensive in relation to the pleasure and convenience it affords! If you care to publish these details, doubtless they will be of interest to new riders.

L. STANLEY PAGE.

English v. German Motor Cycles.

Sir,—May I say a word for a certain English-made motor cycle, which should appeal to "Iddo," the champion of the N.S.U.?

He asks for an engine with overhead inlet valve, gear-driven magneto, reliable, etc., etc. Has he considered the 3½ h.p. Rudge-Multi? It has the excellent type of valve he refers to. This design is certainly good, as the cool incoming charge impinges direct on the exhaust, and for theoretical reasons it is good, as the combustion head is more compact than the side-by-side valve type. The magneto is gear driven—in front of the engine it is true, but high up and well shielded, whilst the vernier adjustment is far superior to that on the German machine.

The N.S.U. two-speed gear is doubtless good; the Multi gear is delightful. Has the N.S.U. done anything to speak of, beyond giving satisfaction in private users' hands, such as a strenuous test like the Senior T.T. and countless Brooklands races and records besides reliability trials? The Rudge machine is fitted with the C.A.V. magneto; the earlier models were made in Stuttgart, but I believe I am right in saying the later models are made in England by Messrs. C. A. Vandervell.

I have ridden a 1913 T.T. Multi 9,603 miles, per speedometer, and I have yet to have my first involuntary stop or mechanical breakage, while the plating and enamel look like new.

Can "Iddo" do sixty miles per hour—by accurate speedometer, not guessing? Can he average ninety miles per gallon of fuel? Will a belt last him 2,500 miles? My Rudge has done, and will do, any of these.

The N.S.U. is a good enough machine, but if "Iddo" looks round he will find plenty of English machines that are better, and in fairness to our own makers I write this letter.

May I add I have no interest in the firm beyond that of a satisfied user. H. G. HARRISON.

A North Wales Test Hill.

Sir,—It seems to me, after reading Mr. Abraham's interesting article in your Summer Number, that these are the kind of trials we want to improve our machines for service under the present conditions. What do the party say to a hill which climbs 1,400 feet in about a mile, giving an average gradient of about 1 in 3.8? There is such a hill at Trefriw in North Wales starting by the bridge over the Crafnant river on the road leading to Lake Conlyd over the Creigian Gleision, which they might try. It has over a dozen hairpin bends, and on some of these I found gradients in the neighbourhood of 1 in 2.5 by the rough tests I made when I took my 2¾ Douglas up a few weeks ago. It is said by the people at the farms by the lake to be the first machine to get up. The gear was lowered by the adjustable pulleys to 11½ to 1, but otherwise the machine is an ordinary 1913 model T.T. Douglas without a clutch, and what made it more interesting was that the cylinders have not been cleaned for nearly 3,000 miles, and the climb was started on the spur of the moment with a fairly warm engine. I have no connection with the Douglas firm, but any credit for the climb must be given to the fine engine and the possibility with an adjustable pulley of suiting the gear to the work. R. C. MEESON.

Motor Cycle Front Hubs.

Sir,—I would like you to spare me a little space in your excellent paper to point out to "All Weathers" that the James hubs are really weather-proof. Instead of simply fitting a dust shield at the side of the hub, they screw end plates into it. The plate revolves with the hub, consequently there are no joints to let dirt in; but I find if I use oil it is thrown out through the oil cap. So now I use grease, and never have any trouble, and only have to add a new charge every 1,000 miles. I am surprised that such a vital part of a motor cycle has received such little attention by the designers. It will be a matter of general interest for readers to learn that the 4¼ h.p. James has Timken adjustable roller bearings in the front hub. I notice interest is now being displayed in spring frames, but nobody points out that the spring frame Indian is as perfect as one could wish. I found that my 1913 and 1914 models had no signs of side play at the pivoted chain stay joints or spring joints after 8,000 and 6,000 miles. I could do 420 miles in one day, but with a rigid frame 200 is quite enough. Why are front rim brakes still fitted? They only scrape the plating off the rim, and if they were of real use one dare not use them riding solo on grease, for a locked front wheel means a fall, whereas a locked back one does not matter much.

I would like to point out there are several machines with a tank control to the clutch. Now, if one is going along a main road and a cart suddenly swings out from a side street it is rather an awkward matter controlling the machine, for one has to adjust the throttle, declutch, sound the horn, and put the hand brake on; and you are expected to do all this with the right hand, and steer with the left.

I have no financial interest in any motor cycle firm, but merely desire to point out the merits of the only two machines I have liked out of eight. RED INDIAN.

Lending Spares on the Road.

Sir,—My faith in the freemasonry of the road has received a shock. Apparently the road sponger still exists. On Sunday, May 30th, I encountered in Abridge a young fellow who had come to grief with a machine through a broken plug. He explained to me that he had several spares at home, and asked if I could lend him one. I did so, the plug being a new Lodge. He then found his gear rod had come apart, and I put him right again by giving him the necessary bolt and nut. He took my address, and promised to return the plug and the bolt the next day. They have not yet come to hand.

I mention the incident not for the value of the articles, but as a warning to others not to part with similar accessories to strangers without some sort of guarantee that they will be returned. Perhaps the young gentleman concerned in this instance may have mislaid my address. If so, perhaps the publication of this letter will enable him to put himself right in my estimation.

A. WEBSTER.

SUMMARY OF CORRESPONDENCE.

We have received a long letter from Mr. T. W. Loughborough, the secretary of the A.C.U., in which he criticises the circular letter sent out to club secretaries by the Coventry and Warwickshire Motor Club; but as we have the assurance of the treasurer of that club that the question does not affect the A.C.U. (the 6d. affiliation fee amounting to only a small sum), but concerns rather the car members' fee of 7s. 6d. per head to the R.A.C., we do not consider it advisable to open our columns to a controversy on this subject.

THE PERFECTION OF AIR-COOLING.

The Harcourt Radiators maintain the full efficiency of engine under the worst conditions: OIL CONSUMPTION HALVED. OVERHEATING ABOLISHED.

WHAT USERS SAY.

MR. H. LINDLEY, Less Yard, Meadow Lane, Leeds, (Humberette.) "I am pleased to say all overheating troubles have been overcome. Before fitting these I have tried repeatedly to climb one or two hills with two up on top gear, and could not do so. But now I have the satisfaction of going up on top gear and having a cool engine to finish with."

PEDLEY

GIVES THE

GREATEST MILEAGE.

Proved by actual experience with different tyres.

"Magnet," in *Motor Cycling* of May 18th, recited his experiences with different tyres. Of several makes tested the best results were obtained on Pedley tyres, which gave the greatest mileage, thus—

4,762 MILES STILL RUNNING.

(3,792 Miles Back Wheel—970 Miles Front Wheel.)

Another Pedley Tyre ran 4,206 miles

before the canvas began to show.

"Magnet" remarked this was the longest mileage ever obtained from one cover used solely on the back wheel.

(The machine was the big Clyno Sidecar Outfit.)

FLYING
—The Why and Wherefore.

ELEMENTARY HANDBOOKS FOR THOSE INTERESTED IN AVIATION.

MODEL FLYING MACHINES.

THIS comprehensive little handbook should be read by everyone desirous of obtaining an insight into the principles which govern human flight by means of aeroplanes. It was written after a careful study of the principal works on the subject and gives, in non-technical language, an interesting survey of aeronautical progress from its early days. The text is well illustrated with photographs and drawings.

Price 1/- net. By Post, 1/2

A USEFUL handbook devoted to the construction of practical models of flying machines of all types. It deals in the main with aeroplane models, but special chapters are included dealing with direct lift and flapping wing types. Profusely illustrated from drawings by the author.

Price 1/- net. By Post, 1/2

Obtainable from ILIFFE & SONS LTD., 20, Tudor Street, London, E.C., ——— and leading booksellers.

VALVE STRESSES.

Mr. Granville E. Bradshaw's Reply to his Critics.

MR. W. L. SPENCE, in replying to my article on the above subject, is quite incorrect in saying that I put "far too much emphasis on inertia stress when attention should really be directed more to heat stress." I should be very pleased to have Mr. Spence's views as to how heat can increase the *stress* in the valve. The heat certainly reduces the strength of a valve to resist the stress, but there can be no doubt of the fact that the chief stresses are induced by the items I mentioned.

Mr. Spence goes on to say that "if the chief stresses are caused by the valve stem, etc., being brought to rest in an extremely short space of time, then obviously one should have nearly as much trouble with the inlet valves as with the exhaust valves." I am at a loss to understand how Mr. Spence can have arrived at this conclusion from the reading of my article, for, as already mentioned, I clearly indicated that the strength of material in the cool valve may be 40 tons per square inch, and in the red-hot valve 1 ton (or less) per square inch; and whilst under equal conditions with regard to strength of valve spring, weight of valve stem, etc., both the inlet and exhaust valves are stressed the same amount, the reason why the exhaust valve gives all the trouble is because its strength to resist the stress is so very small compared with the strength of the inlet valve.

The valve with the shouldered stem, shown by my sketch (fig. 1), is not thoroughly bad, as Mr. Spence indicates, but is at least 10% stronger than if the small diameter stem were carried right up to the radius under the head, because in the first place the length of the small diameter part of the valve is reduced by 10%, and in the second place the part which gets really hottest, and is consequently considerably weaker, is largely increased in sectional area, and therefore more capable of resisting the stress.

Mr. Spence then states that, "assuming the primary importance of reducing inertia stress be correct, all that is necessary is to drill up the stem with a series of stepped holes, each advance being of smaller diameter than the previous one, and then reamed out to make a conical hole of fair outline." This is quite nice in theory, but does not work out in practice, and it is an idea that I tried over two years ago.

Whilst it practically removes the tendency of the valve to become over-stressed, it is not by any means a simple matter, with present-day materials, to drill and reamer out a valve stem in this way.

As I mentioned at the conclusion of my article, engine design of any sort is a compromise, and the best points of design have often to be discarded because some other detail is inferior in consequence. In this latter case the material left in the valve stem at the cotter hole proved so small that the cotter was cut through very rapidly, and new cotters were necessitated every 2,000 miles. In addition to this, the valve steel I have been using is of such tensile strength and hardness that it is almost impossible to find drills and reamers that will remove the material at all, much less do this cheaply enough to admit of the design being adopted.

With regard to Mr. A. W. Montgomery's letter, pointing out that a combination of steel and tungsten is utilised by a certain American firm in the manufacture of valves, I note that he states he has used a set of these for six months without stretching, breaking, or *appreciably* pitting (the italics are mine). I have made very careful tests with tungsten steel, and although it is almost impossible to break valves made of this material, I find that such valves require grinding in from five to eight times as often, and the valve seats are in an extremely bad condition after 500 miles.

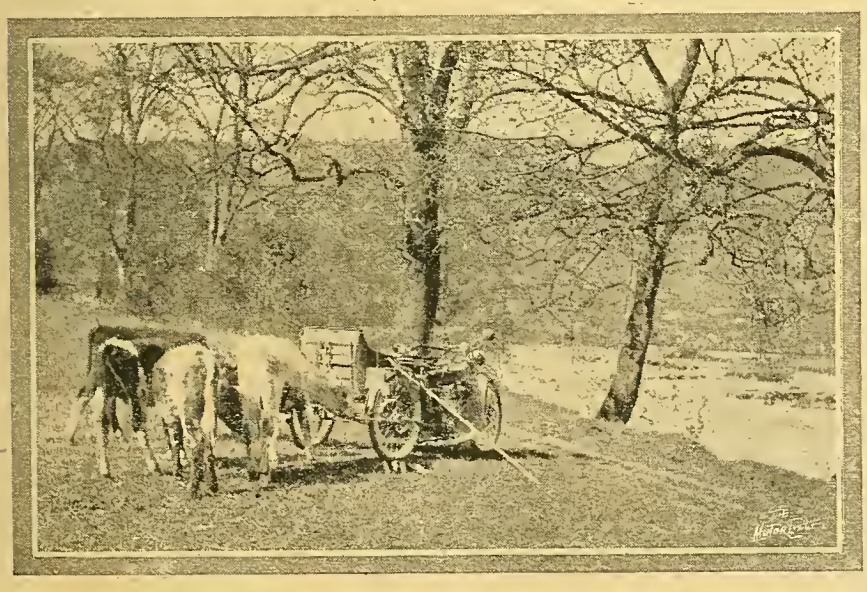
Your correspondent "Valvular" also refers to tungsten steel valves, but I do not agree with the person who told him that these valves were unaffected by any temperature in an engine in use for ordinary road work. The material is remarkably strong compared with other steels when in a red hot state (from two to three and a half times the tensile strength at 700° C.), but the valve stems and seats scale very badly if the heat is maintained for any length of time.

"Valvular" is correct when remarking on the cost of tungsten steel valves. I have had 3% nickel valve stampings quoted at 4½d. each, and the same valve stampings in tungsten steel have been quoted at 6s. 6d. each, and on top of this the cost of grinding tungsten steel valves from the stampings and machining 3% nickel valves is almost in the same proportion as the cost of the stampings themselves.

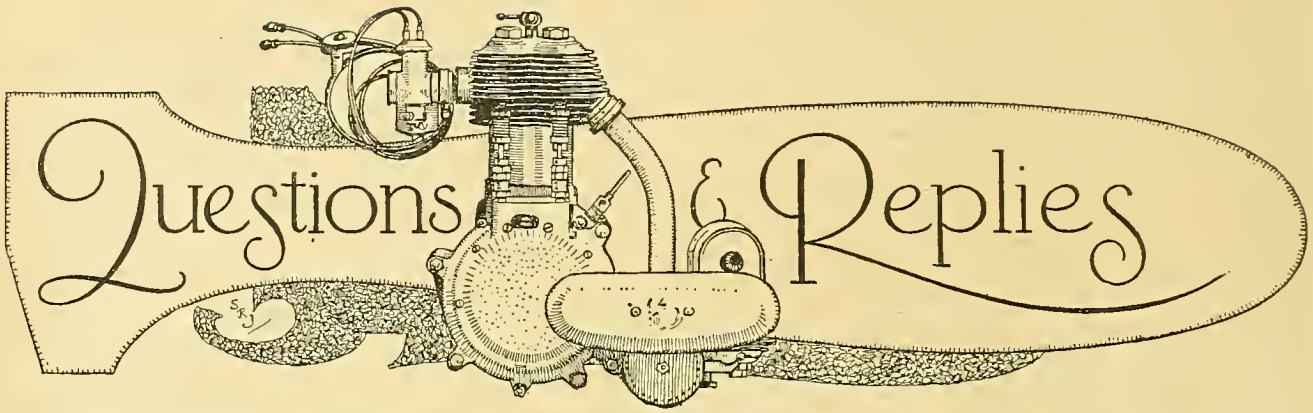
Whilst on the subject of materials, I might mention a very troublesome point that has arisen, probably due to the rush on materials, and particularly high-grade steels, since the outbreak of war. Before the war broke out, we had with A.B.C. engines experienced only two valve breakages in the machines turned out in two years, and with the so-called same material delivered after war and during the steel makers' rush we have had no less than five valve breakages since February of this year.

It appears, therefore, that the steels now obtainable are not so reliable as formerly, and this has necessitated further investigation with a view to reducing valve stress still further to accommodate the inferior material. I wonder how many other manufacturers have experienced the same trouble with materials?

GRANVILLE E. BRADSHAW.



An angler's P. and M. sidecar outfit becomes an object of interest. Calves are not particular as to diet, a fact worth remembering when leaving one's mount amid rural surroundings.



Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Registration.

I have had a new engine fitted to my motor cycle. Will it be necessary to communicate with the registration authorities? The old one is registered a De Dion; this is an M.M.C.—E.B.

Yes, you should communicate to the registration authorities any change in the construction of your machine which would require an alteration in the register.

Lubrication.

I have just purchased a 220 c.c. two-stroke, and no instructions as to oiling were sent. It is a drip feed, and I find one drop every five seconds gives best results. Is this sufficient? At first I over-oiled and used a pint to fifty miles.—B.F.

We should say that the lubrication suggested in your letter would be correct.

Warming the Carburetter.

I own a 6 h.p. twin motor cycle, which is fitted with a long exhaust pipe. If I clipped a 4ft. copper pipe, say, of ½in. inside diameter, to the outside of the exhaust pipe and led it to the main air intake of the carburetter, would the warm air passing into the carburetter be of any benefit? If I fitted an arrangement whereby the exhaust gases would pass direct from the end of the exhaust pipe, through this pipe, and thence into the carburetter, would I get increased speed, or would the hot exhaust gases interfere with or upset carburation? The inlet and exhaust valves are interchangeable. Is it advisable to give the exhaust valve a slightly bigger lift than the inlet valve, in order to facilitate the exit of the gases?—A.W.

The exhaust gases may be used to warm the carburetter, but should not be mixed with the air entering through the air intake, as this would affect the carburation. It is all right, however, to introduce these to a jacket round the vaporising chamber. The lift in both cases should be about ½in. There is no particular object in altering the lift of the exhaust valve from that which the makers have arranged.

Licences for a Dealer.

Having been a reader of your paper for a number of years, and now being about to start in business as a dealer, can you tell me what licences (if any) are taken out by a motor cycle agent?—P.R.B.

The licences required by a motor cycle agent are: Driving licence, obtainable from the local licensing authorities, and also trade licences for riders to take out machines for testing or demonstration purposes; registration and licence for machine for your own use, which are best obtained from your local licensing authority; and a licence to sell and store petrol, obtainable from the local inspector under the Petroleum Act.

Coventry to Torquay.

I shall be grateful if you will give me—(1.) The best route from Coventry to Torquay. (2.) Information as to hills, police activity, and lighting regulations. (3.) The average speed possible for the journey on a modern 3½ h.p. machine. (4.) Would you recommend a variable pulley gear or a three-speed model for sidecar work and also for solo use?—A.C.W.

(1.) We recommend the following route: Coventry, Kenilworth, Warwick, Stratford-on-Avon, Winchcombe, Cheltenham, Painswick, Stroud, Nailsworth, Bath, Radstock, Wells, Glastonbury, Durston, Taunton, Cullompton, Exeter, Chudleigh, Kingsteignton, Newton Abbot, Torquay, or Exeter, Dawlish, Teignmouth, Torquay. (2.) There are no hills which would worry a modern machine on this journey. The police are not likely to give trouble if you drive carefully in towns and villages, nor are the lighting regulations likely to give you trouble until you get near the coast. An article dealing with the lighting regulations in force in different parts of the United Kingdom was published in *The Motor Cycle* of March 18th. (3.) You should be able to average twenty miles an hour with this machine. (4.) Probably the three-speed model is better for sidecar work, as it allows you to have a lower bottom gear. For solo work, the low gear on the variable pulley is low enough for ordinary purposes.

Redditch to Weston-super-Mare.

Will you please let me know the best route from Redditch to Weston-super-Mare, together with the total distance?—A CONSTANT READER.

We recommend the following route: Redditch, Evesham, Cheltenham, Painswick, Stroud, Nailsworth, Bath, Marksbury, Stowey, Compton Martin, Blagdon, Weston-super-Mare. The distance is approximately 110 miles. This is a pleasanter run than through Gloucester and Bristol, though the latter is shorter, and Bristol can be avoided by turning to the right at Filton and going over Clifton Downs and across the new bridge over the Avon (not the Suspension Bridge).

Overheating with a Two-stroke.

I should be much obliged if you could suggest any reason for the trouble I am having with a 1910 machine. It seems to overheat badly, the crank case getting extremely hot. It does not answer to the throttle at all. I use Reliance plugs. The compression is not very good, I fear; cylinders are free from carbon, and I keep the spark well advanced. Is it possible that any of the exploded charge gets into the crank case and causes it to overheat?—L.S.D.

It seems highly probable that the overheating trouble with your engine is due to worn pistons, which allow the explosion gases to pass into the crank chambers on the firing stroke. In this event it is obvious that the worn pistons will not allow sufficient suction on the carburetter, since the crank chambers are partly full of hot gases. The inability of the engine to answer the throttle, and the overheating, are also indirectly due to the incomplete crank chamber suction. As the machine is approximately five years old, and has probably seen a good deal of wear, we should think the best thing that could be done would be to have the cylinders rebored and new pistons fitted, when the efficiency of the engine should be completely restored, provided the crankshaft compression washers and transfer port gauzes, etc., are all in good order.

An Oily Engine.

(1.) When changing to high gear on my 2¾ h.p. lightweight the explosions change to a sort of clicking or hitting noise for a short distance, in place of the usual round full tone of the ordinary explosion. There is nothing metallic about the sounds, so I am not quite sure if this can be termed "knocking." The same thing takes place also when slowing down on high gear. (2.) I find that the countershaft belt pulley does not run quite freely. I mean that when the belt is removed the pulley (when in neutral position, of course) does not revolve smoothly with a twitch of the hand, but has practically to be pushed all the way round. There is practically no force required, but I thought that the pulley when free from the belt could be sent spinning round easily. If it is too tight, how can I remedy the trouble? (3.) My engine regularly gets absolutely spattered with oil, even on short runs. I suspect a leaking pump. I have an ordinary plunger pump, raising it to draw oil from tank, and depressing it to send it down, through a spring valve, to the engine. This spring valve, to all appearances, is all right, so that I can hardly account for any oil getting past it, unless it be that the suction from the engine tends to pull the valve downwards, and so opens it; but I take it that there would be no oil to pass until the plunger is raised. Can you suggest anything? My oil tank is frequently empty when I am under the impression I have given about two pumpfuls, when running, but the oily condition of the engine points to it getting far more oil than this.—W.J.M.

(1.) The trouble is probably caused through having the spark too far advanced when you change up, or probably you have not accelerated sufficiently on the low gear before changing. The noise is a sort of knocking caused by pre-ignition. (2.) The reason why the pulley does not revolve freely may be due to an excessive amount of grease in the gear box, or to grease which is rather too thick. If this is the case, try Ambroleum, or some similar semi-liquid grease. Do not forget that there are gear wheels attached to the pulley-shaft, the teeth of which have to cut through the grease. (3.) The only thing you can do is to clean the crank case thoroughly, and then run the engine on the stand, and examine where the leakage is taking place. This ought to be quite easy to find. It may, of course, be at the union or at the crank case joints. If the former, this should be tightened up, and if at the latter, if the leakage is serious, the crank case will have to come apart and be repacked with brown paper soaked in boiled linseed oil. It will be best to take the pump apart, and see that the valve is quite sound, and that there is no possibility of leakage. Perhaps a stronger spring would cure the trouble. Do you find that the engine smokes? If it does not, the leakage may not be due to excess of oil, but merely to defective unions or crank case joints.

Bicester to Llandudno.

Would you kindly give me the route from Bicester to Llandudno, and if possible an alternative route for the return?—H.G.

Either of the following can be recommended, though the former is the prettier: Bicester, Banbury, Stratford, Alcester, Kidderminster, Bridgnorth, Much Wenlock, Shrewsbury, Llangollen, Corwen, Bettws-y-Coed, Llanrwst, Llandudno. Approximate distance 180 miles. Bicester, Brackley, Towcester, Weedon, Daventry (turn right at bottom of hill), Crick, Three Pots, Atherstone, Fazeley, Gailey, Weston (turn right), Newport, Hinstock, Whitchurch, Wrexham, Mold, St. Asaph, Abergele, Colwyn Bay, Llandudno. Approximate distance 192 miles.

Timing a Twin.

Would you kindly let me know the correct method of timing a 1913 6 h.p. twin engine, as I have had to order the entire parts, and the old parts are not marked; also do you advise packing the new parts in grease?—S.

We should recommend you to time the engine in the following way: Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for one complete stroke of the piston, or while the flywheels turn through 180°. Time the magneto as follows: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded. It is not usual to use grease for the timing gear; a little oil is all that is necessary.

The Petroil System.

I have recently bought a second-hand two-stroke, and I am not quite certain of the correct proportion of lubricating oil to petrol. Could you kindly inform me what is the usual mixture?—N.A.

Some makers recommend a proportion of one part of oil to fourteen of petrol, others one to sixteen, or half a pint of oil to one gallon of petrol. This should be taken as a minimum quantity of oil. When an engine is new it is advisable to exceed this and keep the engine smoking slightly for the first two or three hundred miles.

READER'S REPLY.

Valve Trouble or Worn Piston Rings.

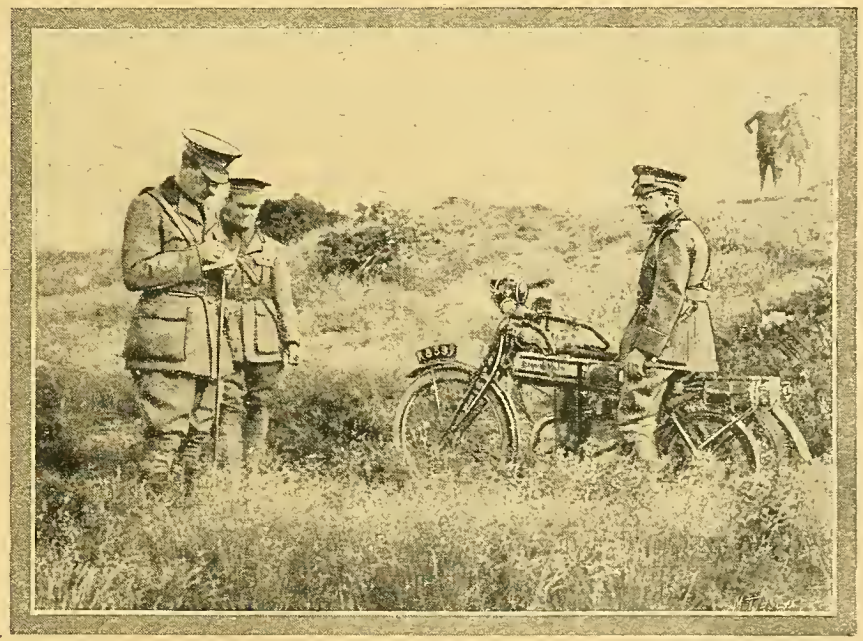
I notice that you give valve trouble as the cause of "G.W.'s" complaint, but I am pretty certain that it is due to worn piston rings, as I suffered from this same complaint on a machine that had run 10,000 miles, and cured it by fitting new rings.—C. S. ROSCOE.

EXPERIENCES WANTED.

"H.W." (Newry).—Binks carburetter on 1914 or 1915 6 h.p. Enfield with sidecar. Ease of starting, consumption, free engine running (tick over), power on hills, and sizes of jets used.

"R.C.G." (Bridlington).—8 h.p. 1914 Chater-Lea and 8 h.p. Zenith with countershaft gear, for sidecar work. Speed, consumption, tyre wear, and reliability.

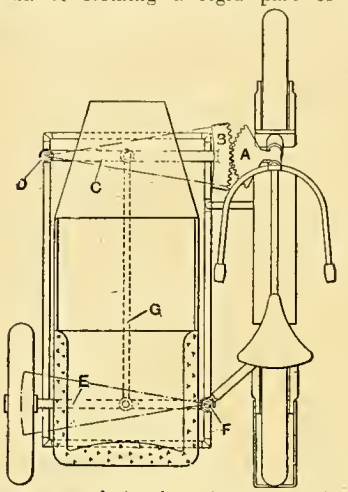
"A.M." (North Finchley).—4¼ h.p. three-speed James and sidecar. Reliability under continuous hard usage, consumption, power, wear on chains, ease of steering, and stability on grease. Also 4¼ h.p. three-speed B.S.A. with sidecar.



MOTOR VOLUNTEER TRANSPORT SECTION.
Despatch rider, mounted on a Rudge-Multi, waiting for message from officer commanding Liverpool Motor Transport Volunteers, N.V.R.

A Steerable Sidecar Suggestion.

With the object of facilitating the steering of a sidecar, the sidecar wheel is caused to move in unison with the front wheel of the bicycle. A toothed segment A is mounted on the steering stem and engages a corresponding segment B carried by an arm C pivoted at D to the sidecar frame. The sidecar axle E, instead of forming a rigid part of the



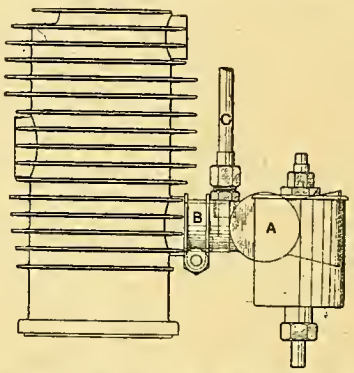
frame as usual, is pivoted at F, so that it can move in a horizontal plane, and the axle F and arm C are coupled together by a rod G, so that the sidecar wheel follows the movements of the steering wheel. One is left in some doubt as to what supports the near side of the sidecar,

PATENTS BY ERIC W. WALFORD.

seeing that the axle has only a pivoted connection at F.—W. A. James, No. 16,167, 1914.

The Villiers Two-stroke Lubrication System.

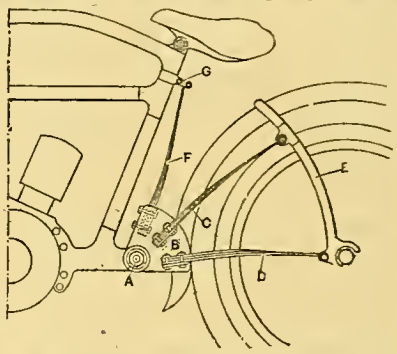
In the Villiers engine, it will be remembered, the oil passes with the ingoing gas into the cylinder, although it



is not first mixed with the petrol. The drawing shows the fitting by which this is accomplished. The carburetter A is clipped to the cylinder at B, and adjacent to the attachment a pipe C enters the gas passage. This pipe is supplied with oil from a drip feed device, so that the oil is taken direct into the cylinder.—C. G. Garrard, F. H. Farrer, and the Villiers Engineering Co., Ltd., No. 14,174, 1914.

Rear Spring Suspension.

Pivoted at A is a sector B, to which are attached five laminated springs. Of these, C and D are duplicated on each side of the wheel, and are attached to a tubular member E, which passes right over the wheel and carries the ends of the spindle. The fifth spring F is equal in tension to the other springs added



together, and it has a sliding connection at G to the main frame, passing between a pair of rollers to reduce friction. It is stated that no guides are required, as the arrangement of the springs affords sufficient lateral rigidity.—J. E. Spedding, No. 17,783, 1914.

A 48 lb. Sidecar.

In describing the Henderson sidecars in our issue of the 3rd ult. we should have stated that the latest coachbuilt model scales approximately 48 lb.

A.C. Sociables.

We are informed by Auto-Carriers, Ltd., that all communications relating to the sale and repairs of the light cars, sociables, etc., should be sent to the company's London address, 181, Hercules Road, S.E.

1916 Models.

Mr. Victor Welsford, London manager of the Harley-Davidson Motor Co., Newman Street, Oxford Street, W., has left England for the United States, whither he has gone for the purpose of arranging for the 1916 Harley-Davidson models at the Milwaukee works.

Spring Fork Links.

We are informed that the spring fork links sold by Messrs. Herbert Terry and Sons, Ltd., Redditch, are now made in a specially light form for machines of less than 2 h.p. These links increase the comfort of certain forks very considerably.

Racing in Australia.

We are informed by Messrs. Zenith Motors that at the Easter Carnival at Goulburn, N.S.W., the thirty-three miles handicap for members of the Sydney club resulted in a first for Sergeant Fair on a 6 h.p. Zenith. The third place was obtained by H. Bartlett, also on a 6 h.p. Zenith.

SPARKLETS

A Cheap Insurance Policy.

The Mutual Property Investment and Accident Co., Ltd., of Manchester, have inaugurated a new coupon policy for motor cyclists, the annual premium for which is only 5s.

New Birmingham Repair Depot.

The Colmore Depot has just opened new repair shops in Station Street, Birmingham, quite close to the firm's showrooms in John Bright Street. A speciality is to be made of motor cycle overhauls, and modern machinery has been installed.

Sun Successes.

Some very creditable performances stand to the credit of Sun lightweights fitted with the Vitesse engine. We have already chronicled the results of the Cork Twenty Hours Trial, in which these machines won gold and silver medals and the special lightweight prize. The Sun machines were the smallest in the trial, viz., 269 c.c., and the route very trying. In addition to this, the same riders, J. J. White and J. F. A. Day, gained first and second places by a substantial margin in the Six Mile Speed Trials at Portmarnock on May 15th.

War Publications.

Among the minor results of the war of interest to motor cyclists are the booklets that many of the firms engaged in Government work are producing. The most attractive of this kind we have yet seen is the B.S.A. "War Service," which, as may be surmised, is published with the intention of calling attention to the extensive use of B.S.A. motor cycles and pedal cycles by the various branches of the Army.

Sidecar Outfits in Australian Trial.

We are informed that in the Victorian M.C.C. Easter reliability trial first and second places in the sidecar class were secured by a Peerless fitted with a 4 h.p. twin-cylinder Precision engine and a Precision "Big Four" respectively. The first-mentioned is a locally-built machine, and it was the only sidecar outfit which kept on time right through the run. The trial extended over four days, the distance covered being six hundred miles. This may certainly be considered a strenuous test.

Rudge Overseas Successes.

As far apart as Denmark and New Zealand, Rudge machines are doing well in trials. In the former country the Rudge team won a twenty-four hours team trial. There were eleven teams, each consisting of three riders. In New Zealand a Rudge rider, R. Jones, was successful in winning, at Napier, on Easter Monday, the ten miles race, time 10m. 46s. A fortnight after, Jones won two other races at the Marton sports, *i.e.*, the ten miles race and the flying mile.

MOTOR CYCLES FOR SALE.

Auto-Wheels.

AUTO-WHEEL, Juno trader tricycle carrier, with all latest improvements; price £26/3/6 net, or 47/6 monthly.—Seen at 248, Bishopsgate, London, E.C. [7713

SECOND-HAND BARGAINS.

Stock No. **UNDER £20.**

779. Old Motor Cycle, De Dion engine, tank, wheels incomplete £2 10
834. 1¼ h.p. 1914 **ELF**, new condition, magneto, spring forks, an ideal lightweight £17 0
134. 2 h.p. **MOTO-REVE**, twin-cylinder, magneto, very nice order £17 0
255. 3h.p. **WANDERER**, twin-cylinder, magneto, spring frame and forks £17 0

£20 to £30.

99. 6 h.p. 1910 twin-cylinder **REX**, magneto, 2-speed gear, handle starting, nice order £25 0
168. 4 h.p. 1911 **BRADBURY**, 2-speed gear, just re-enamelled, complete with coach-built Sidecar £29 0
222. 3½-4 h.p. **ZENITH-J.A.P.**, with Gradua gear, lamp, and horn.. £22 10
308. 2½ h.p. **O.K.** Junior, 1914, 2-sp., in fine order £24 0
2½h.p. lady's **HOBART**, 1913, 2-sp. and clutch £25 0

£30 to £40.

906. 6 h.p. **CLYNO**, 2-speed, and cane side-entrance Sidecar £35 0
155. 4 h.p. 1914 **CHATER-J.A.P.**, with Mark VII. 3-speed hub, spare petrol tank, etc. £31 10
260. 6 h.p. 1913 **REX** de Luxe, coach-built Sidecar, 2-speed, and clutch £37 10
173. 3½ h.p. **HUMBER**, 1912, 2 speeds, and handle starter, footboards, decompressor £30 0

OVER £40.

434. 6 h.p. **CLYNO**, 1913, 3-speed, kick starter, detachable wheels £50 0
14. 5 h.p. **HAZLEWOOD-J.A.P.**, with Bramble Sidecar £55 0
108. 6 h.p. 1914 **CLYNO** and No. 6 Sidecar, just re-enamelled £63 0
273. 8 h.p. 1914 **MATCHLESS**, J.A.P. engine, 2 speeds, c/shaft gear, chain drive, and kick starter .. £50 0
292. 6 h.p. **CLYNO**, 1914, 3 speeds, with No. 1 Sidecar, lamp, horn, and spare wheel with tyre ... £70 0
306. 7 h.p. **INDIAN** (Oct., 1913), 2-sp and kick starter, with Millfor Indian Sidecar, lamps, whist and speedometer, only dc 2,000 miles £52 10

Most of the above can be sup on EXTENDED PAYMENT.

IGNITION APPLIANCES.

RUNBAKEN.—Efficient magneto repairs by specialists. Moderate prices. Return within 24 hours.

RUNBAKEN.—Spare parts for Bosch, Eisemann, U.H., etc., in stock. Several good second-hand magnetos. Send for illustrated booklet.

REMEMBER that the magneto is the very life of your motor, and when damaged requires special attention by thoroughly skilled workmen. It will, therefore, pay you to send it to us, otherwise irreparable harm may be done through careless handling.

TYLE Runbaken Magneto Co., Ltd., Camp Street Works, Deansgate, Manchester. Tel.: 6111 City (3 lines). [0404

BASTONE'S for Magnetos, singles and V type; cyls., and right prices.—228, Pentonville Rd., King's Cross, London. [8041

JEBRON, registered 291298, greatly superior to platinum, unequalled for blades, screws, etc. cures misfiring; 2/6 each rivet; Jebron screws, fit Bosch magnetos, 5/6 pair; old screws Jebronised, 2/6 each.

JEBRON Contacts, used by Messrs. Collier Bros., Colver, Martin, making world's records.—Jebron, 38, Herbert Rd., Woolwich, London, S.E. [X4331

MAGNETO Repairs of every description by Bosch specialists; expedition and moderate charges. Magnetos bought and sold. 1 and 2-cyl. in stock.—The Magneto Mart and Repairing Co., 142, Wardour St., W. [7992

BIRMINGHAM.—Magneto Repairs.—Re-winding, re magnetising, and overhauling promptly executed; moderate charges.—The Electrical Trades Supply Ltd., 41, Gt. Charles St., Birmingham. T.A.: Motors, Birmingham. [5610

MAGNETO Repairs of every description, armature winding a speciality. We are late from the Bosch works, and entirely British, and give same guarantee at half their prices.—The Magneto Repairing and Winding Co., 158, Seymour St., Euston Rd., London. 'Phone: Museum 1158. [8013

BELTS.

BASTONE'S.—Lyso rubber belting, ⅞in., 8ft. (two pieces), lengths 6/6; 1in. ditto, 9/6.

BASTONE'S.—Best English make rubber and canvas belting ⅞ 1/-, 1in. 1/3 per foot.

BASTONE'S.—Leather and chrome belting, ¾ 1/-, ⅞ 1/2, 1in. 1/4, 1¼in. 1/6 per foot.—228, Pentonville Rd., King's Cross, London, N. [8040

BELTS.—New clearance Dunlop rubber belts, any standard size, 10/6 each.—Palmer's Garage, Tooting. [8049

BALATA-CHROME Belts, highly satisfactory all weathers; ¾in. 9d., ⅞in. 10d., 1in. 1/-, 1¼in. 1/3 per foot, post free.—Pollin, Shepherdswell, Dover. [5998

500 Perfectly New Rubber Motor Cycle Belts, all sizes, fasteners free; satisfaction guaranteed; 6/6 each; dozens of testimonials.—Dancer Motor, 69, Gower St., Lozells, Birmingham. [X9746

LAYTON'S.—Will motor cyclists please note that our price for best English rubber and canvas belting, 7ft. 6in.×⅞in., is 6/6, quality as exactly advertised by other dealers at a much higher figure.—Layton's Garage, Bicester, Oxon. [X9947

TYRES.

LEGGATE, Edinburgh, for 1915 Tyres.

LEGGATE, Edinburgh.—For great reductions and genuine value in brand new clearance 1915 Clincher tyres. Manufactured in this city by the largest india-rubber manufacturers in the British Empire, and famous the world over for quality, resiliency, durability, and non-skidding properties.—See below for approval terms. Prompt despatch guaranteed.

LEGGATE, Edinburgh.—Clearance.—1915 new pattern Clincher Dreadnought, extra heavy, rubber studded, beaded covers. 26×2¼ 31/-, list £2 7/3; 26×2½, to fit 2¼ rims, 31/6, list £2/7/3; 26×2⅝ 32/6, list £2/10/10.

LEGGATE, Edinburgh.—Clearance.—1915 new pattern Clincher De Luxe, heavy rubber studded, beaded covers, 26×2¼, 21/-; 26×2⅝, to fit 2¼ rims, 23/6, list £2/1; 26×2½ 25/6, list £2/2/9.

LEGGATE, Edinburgh.—Clearance.—1915 new pattern Clincher De Luxe, 4-ply fabric, extra heavy, rubber studded, beaded covers, 26×2½, for 2¼ rims, 27/6, worth double.

LEGGATE, Edinburgh.—Clearance.—Extra heavy tubes, brand new, 26×2 6/-, 26×2¼ 6/6, 26×2⅝ 6/6, 26×2½ 7/-.

LEGGATE, Edinburgh. — Clearance. — 1915 Dunlop extra heavy rubber studded beaded covers, 26×2½, 29/6, list 39/-; 26×2½, for 2¼ rims, 30/-, list 40/-; 26×2⅝, for 2¼ rims, 28/6, list 37/9; 28×3, for Indians, 33/-, list 44/-; 28×2½, for Indians, 31/-, list 41/3; heavy 26×2⅝, for 2¼ rims, 23/6, list 30/6.

LEGGATE, Edinburgh.—These goods are all perfect, and sent anywhere on 7 days' approval against remittance; cash refunded in full if goods not approved of.

LEGGATE and Co., Motor Cycle Specialists, 18, Slateford Rd., Edinburgh. [X9916

TUBES (3), new condition, 650×65, 700×80: 12/6 appro.—Ben-Hur, Greenside Rd., Croydon. [7971

The Magneto Supply.

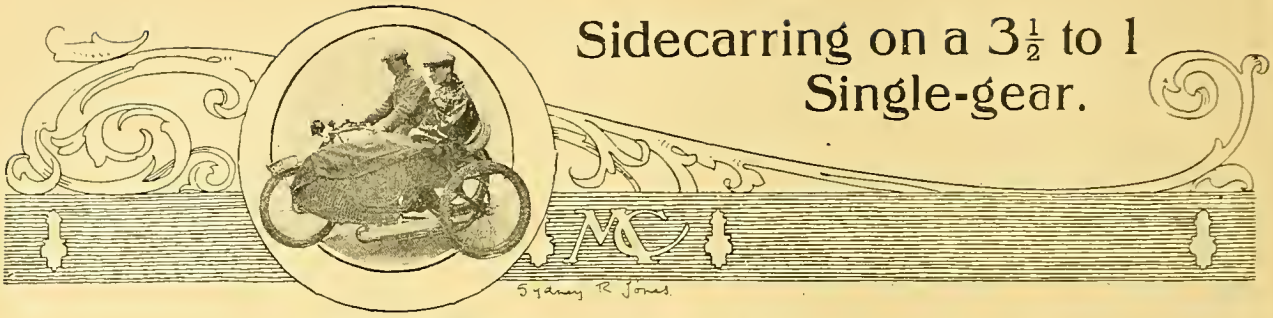
IT will be within the knowledge of most of our readers that this journal has done its utmost to encourage the British manufacturer to devote attention to the subject of home-made magnetos by persistent references to the matter. We claim no special credit for what we have done, though it is a fact that two years ago, when we had the audacity to point out that the motor industry of this country was to all intents and purposes entirely dependent upon the German-made magneto, and that, in the event of any strike, lockout, or sudden cessation of supplies, it was conceivable that the British motor industry would be seriously deranged, we, in conjunction with our sister journal *The Autocar*, were subjected to considerable criticism. Later events showed that our warning was not an untimely one, for it is a well-known fact that supplies of motor vehicles of all sorts (including those for the Army) in this country have been greatly delayed owing to the shortage of magnetos. Had it not been for American intervention, the shortage would have been a good deal more serious.

At the beginning of this year, we outlined the magneto position, as far as British makers were concerned, and published a list of firms engaged in the production of magnetos. We further urged the British motor cycle manufacturer to support the magneto maker in his endeavours to fill the breach. At that time the British magneto industry showed much promise, so much so indeed that it was felt that within a few months practically every make of motor cycle would be fitted with a British-made magneto, or, at any rate, that it would be possible to have the option of a British magneto if the maker's patriotism were not sufficiently pronounced to standardise the home product. But the promise does not seem to have been entirely fulfilled, as it is still a fact that the British-made magneto fitted as standard to the leading makes is in the minority. Readers have gone out of their way to draw our attention to this fact and remark upon it with some regret. With a view to clearing the air, and with the further object of focussing attention upon the British magneto and the desirability that the motor industry of this country shall be a self-supporting one, we addressed a circular letter to the different magneto manufacturers, and in the last issue the different replies were published; these form interesting and instructive reading. Some of the remarks cannot be considered anything but uncomplimentary to the patriotism of the British manufacturer, but we know that these are exceptions and need not be taken too seriously. It does, however, appear from the replies that, where manufacturers are now in a position to give or promise definitely deliveries, there is still a lamentable lack of support from the motor manufacturer.

Magneto *v.* Dynamo

The remarks just made with reference to the magneto apply very strongly at the present time, and are likely to do so in the immediate future, and in the case of light machines for many years to come. But on the heavier and more luxurious types of motor cycle, and more especially on powerful sidecar combinations, there are indications that the magneto may be forced from its pre-eminent position as a spark producer in favour of the dynamo, which, combined with an efficient accumulator, is becoming increasingly popular owing to the powerful and steady light produced by these means. There is no need to discuss here the failings of accumulators—they are well known to all old motor cyclists—but accumulators have been immensely improved in recent years until they are capable of withstanding a heavy discharge, and, used in the manner indicated, they are kept always at concert pitch by the dynamo, and should give no trouble. It really should not be necessary to carry two electrical machines on the same mount.

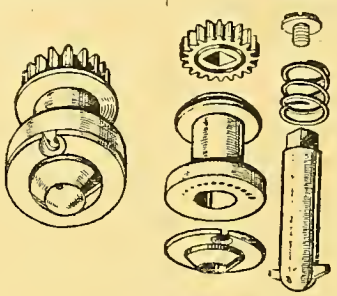
An index to the advertisements in this issue will be found on the page facing the back cover.



Sidecarring on a 3½ to 1 Single-gear.

How a Racing Machine has been "Tamed" by its Owner.

LAST week we received a visit from Mr. J. H. Wilkinson, the patentee of the Wilkinson twelve-jet carburetter. Mr. Wilkinson called at our Coventry offices at 11 a.m., having ridden from Doncaster *via* Newark and the Fosse-way (a distance of ninety-eight miles) that morning. The object of his call was to demonstrate to us the controllability provided by his new pattern carburetter, and for the purpose he brought a machine which one can well realise would require a carburetter of the most controllable type. It was, in fact, an overhead valve 6 h.p. T.T. Matchless-Jap, and was fitted with a sidecar (in which Mr. E. Goult, the hon. secretary of the Doncaster and District Motor Cycle Club, accompanied Mr. Wilkinson), the machine having a single-gear of 3½ to 1. Those who have had experience of the overhead valve racing Jap will know that this engine is not one of the "tick over" variety. With this high-compression mount, it is usually a case of running at twenty miles an hour and taking a flying leap into the saddle as the engine goes off with a rush, and then hanging on for dear life for fear of slipping over the back end of the mudguard, for of power there never was any doubt. We believe that Mr. Prestwich himself will admit that it is an achievement for any carburetter maker to provide the means whereby one of these wonderfully efficient engines can be rendered as docile as, or even more docile than, an engine of the ordinary type.



Component parts of the latest Wilkinson twelve-jet carburetter.

The Engine "Tamed."

Taking a seat in Mr. Wilkinson's sidecar, our driver calmly pushed off with the first jet in operation, and the engine at once commenced its "tick-a-tick" in a most impressive fashion. It would respond to the different jet openings readily and gather speed on hills in fine style. It should here be mentioned that the difference between the old and new type Wilkinson carburetter is the fact that only one jet is in operation at a time on the later model, whereas last year the series of jets were gradually uncovered and used collectively on full throttle opening.

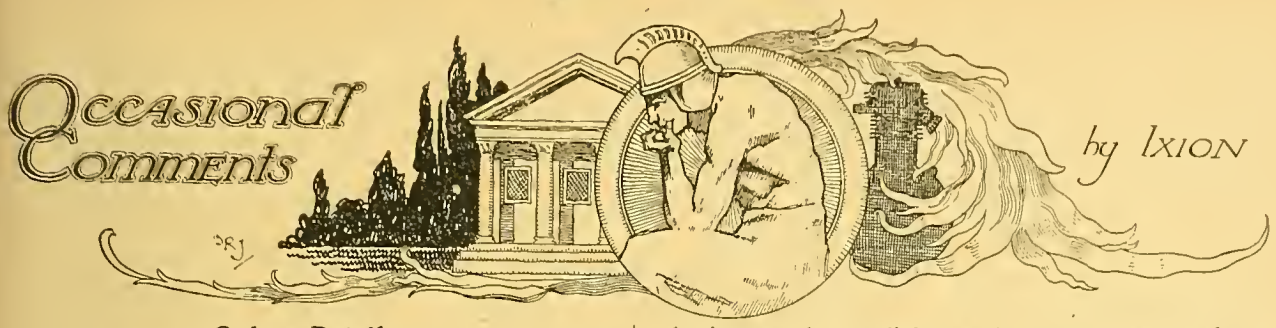
So remarkable were the performances of the machine that we escorted Mr. Wilkinson to our private miniature Sutton Bank. This rise, which is only a gradual one, leads to the local golf links and is approached by rounding one of the most acute hairpin bends imaginable. Mr. Wilkinson, of course, did not know the road, and, after ticking round the corner with both cylinders firing regularly at walking pace, at once swept open the throttle. But we had asked too much, and, although the engine stuck gamely to its task for sixty or seventy yards, it was unable to gather speed, but with a slightly lower gear the feat would have been possible. After that, we indulged in a short speed burst, and, unless the Cowey speedometer told untruths we touched a speed of fifty-four miles an hour on the flat.

Mr. J. H. Wilkinson (driving) and Mr. E. Goult (hon. sec. Doncaster M.C.C.) on the former's 6 h.p. Matchless-Jap.

30,000 Miles in Five Years.

This particular Matchless-Jap of which we speak has been a wonderful machine. Mr. Wilkinson has ridden it constantly since 1910, and estimates that he has covered at least thirty thousand miles on it in the intervening period. It is as reliable as ever, and, in its old age, is now regularly pulling a sidecar. Besides a method of preventing the possibility of broken valve heads falling on to the piston, the owner has fitted a very neat foot-operated valve lifter, a desirable arrangement with such strong springs as are used on this particular T.T. mount.

Mr. Wilkinson had other business to transact in Coventry that afternoon, and in the evening returned to Doncaster. This is something like a run—two hundred miles in one day, including five or six hours spent on business calls! And this on a five year old machine, which should convince those who have any misgivings respecting the life of a motor cycle.



Only a Detail.

Practically every factory employs tube spanners in the erecting shop. A tube spanner is the only spanner which can satisfactorily approach the wee nuts which lock the front brake shoes to their holes in the brake stirrup, for the tube and girder of the forks completely prevent an open-ended or screw wrench from approaching them. I am always detaching these nuts during the job of fitting a speedometer to new machines for press tests, and as I always notice that machines lose condition marks in Six Day Trials for shedding these front brake shoes, I make it a rule to test the tightness of the bolts every week on all machines which I keep in regular use. But I have never yet struck a machine which had the necessary tube spanner—cost about 2d.—in its regulation kit.

Dynamo Sets—a Real Demerit.

It should be quite clearly understood alike by the public and the trade that at present all motor bicycle electric sets suffer from one serious shortcoming. By dint of limited storage accommodation, they are necessarily supplied with accumulators designed for ignition work. Such small and light accumulators are really only fitted to very slow rates of discharge. Avoiding technicalities, one may put it by saying that these cells are adequate for ignition work, where their stored charge will not be used up in less than a month, or in a thousand miles. When they are used for lighting purposes, the rate of discharge is so rapid that they would be completely exhausted in from ten to twenty hours, according to the number and voltage of the lamps they serve. They are, of course, kept constantly replenished by the dynamo, and the wastage is made good as it occurs; but it is the *rate* of discharge which matters, and which determines the longevity of the cells, and is responsible for the amount of trouble they give. No responsible electrician would dream of using such small cheap cells for such swift discharging if the conditions allowed him to use the proper type, which is far more expensive and far more cumbrous and weighty. But the factors of cost, weight and storage apparently tie down the motor cycle illuminating set at present to a type of cell which is technically unsuitable. [See "Accumulators Ancient and Modern," April 29th, page 412.—Ed.] Even the light car, with its higher storage facilities and greater price range, is usually confined to these tiny cells; and it is notoriously true that during 1914 the accumulators on light cars gave more trouble than the whole of the rest of their lighting sets added together. It is, therefore, high praise to assert that our motor cycle electrical sets are already extremely desirable and pleasant possessions; and that when human ingenuity has conquered the task of perfecting a cheap, light, and compact accumulator, thoroughly adapted to a heavy discharging speed, acetylene will be very hard pressed to find a survival niche. By the way, I took out my Low generator the other day after two months of disuse; and a roaring flame leapt from the burner the instant I applied a match, which I did within two seconds of opening the stop cock. This gas had lain in the generator for eight solid weeks!

The 4 h.p. Douglas.

1914 rumour asserted that the big Douglas was not yet wholly worthy of its trim little 2¾ h.p. sister, but rumour is a lying jade, and my own sample is "some Douglas." As I have often written venomously of delivery tune, let me remark that it fired with a healthy bang on the first depression of its kick starter, and that its paces are so far uniformly delightful. Its carburetter was beautifully tuned, and it ticks over quite countably in free engine, when the throttle is shut back. Its sump lubrication is delightful; the W.D. and the Velocette quite cured me of any admiration I ever felt for hand pumps and drip feeds. Apart from the strains they entail on the memory, and the alert attention to engine beat which they demand, I detest buying small quantities of oil on tour. I normally purchase my oil in bulk at a flat rate about half that charged by garages for isolated pints and quarts. So my thrifty soul rejoices when I face a trip running into hundreds of miles, and know that if I have peered beneath a large crank case plug, and seen the green viscid mass close up to the lip of the orifice, I need not bother further about engine oiling or engine oil until my return home. The 4 h.p. Douglas is the first machine with a large output to adopt this ideal mode of lubrication; may others soon copy it.

A Good Transmission.

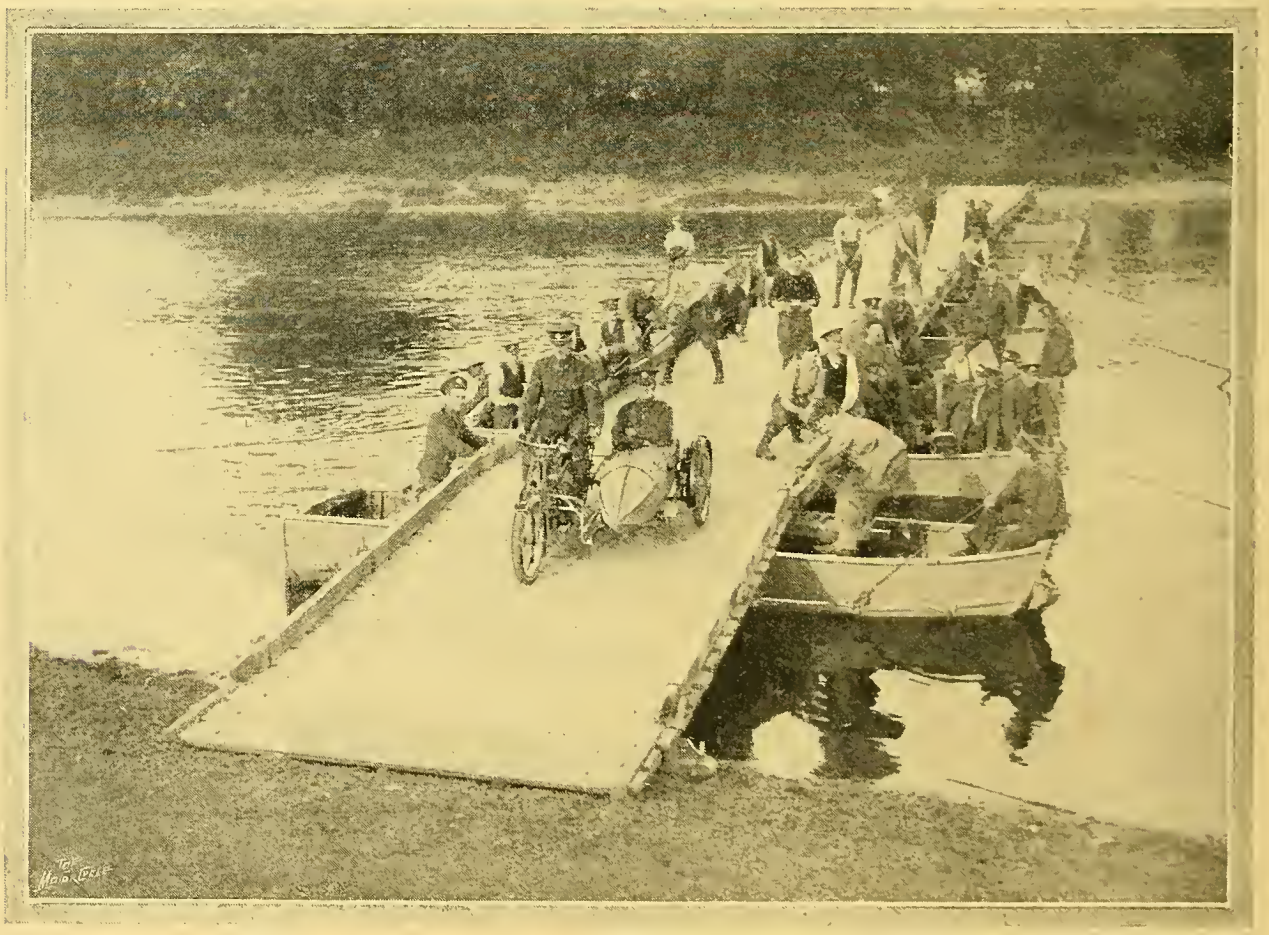
I am now driving a light twin-cylinder of 500 c.c. fitted with all chain drive, spring engine sprocket mounting, and cush hub. In reference to this drive one has to retract all one has said in the past about the harshness of chain drive. As a rule, spring engine sprocket mountings are something of a fraud. If you adjust them to slip when taking up the shocks of a start or a pick-up, they are apt to slip all the time; if, on the contrary, you tighten them sufficiently to prevent them from slipping under full load, they don't ease the preliminaries. I understand my particular combination is of Enfield construction and design, and it is certainly the goods. The pace which the machine can attain proves conclusively that the softening devices lock up solid under full load, but there is no snatch or jar when the engine is manhandled, and one makes it pick up from a crawl on a

Occasional Comments.—

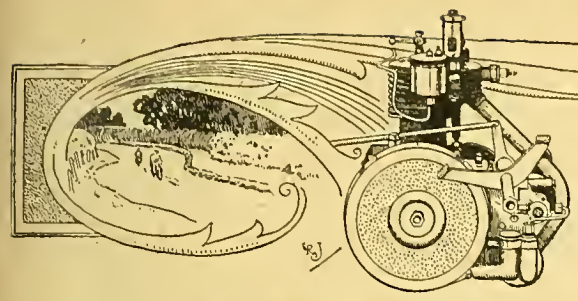
gradient, or jumps it off in a hurry. More than that; the spring sprocket mounting can be heard to slip whenever one changes gear—I do not mean that it squeaks, but the momentary racing of the engine is perceptible for a second or so before the drive locks up. I am not certain that the most fastidious expert dare assert his ability to distinguish this drive from a perfectly adjusted belt in respect of smoothness; if he could, it would be that vibration is a shade more pronounced with the chain transmission when the engine is absolutely all out, and on that point certainty could only be obtained by driving the same engine all out on the belt drive. In any case, the Enfield transmission is a revelation of what can be done in the way of mollifying the quondam acerbity of the chain.

A New Mode of Attaching Sidecars.

All sidecar men are aware that the lighter and more rigid three-wheelers suffer considerably from vibration on really bad roads, and that it is not an unknown thing for the connections or the cycle frame itself to break in a strenuous week of speed work and mountaineering as is represented by a six day trial. A Scottish reader informs me that he is rather pleased with a new method of attachment which he has made and is using on his own machine (a 3½ h.p.) As my readers know, I am no engineer, and do not pretend to be more than a babe in such matters; but the idea strikes my untutored judgment as containing possibilities. What he describes as the "two bottom stays" (presumably those to the front down tube of the bicycle and to its chain stays) are substantial hinged joints, the pivot of the hinge being horizontal in each case. The saddle pin joint is sprung; the long angular stay from the sidecar is a rigid tube, terminating in the usual eye, and the bolt to which it is coupled is free to slide in a bearing, having a coiled spring threaded over it on each side of the bearing. In other words, this is a variation of the flexible sidecar, formerly popularised by Mr. Montgomery, the sidecar being free to swing within limits round a horizontal axis. The inventor describes the comfort as a vast improvement on the rigid attachments, and finds no counterbalancing disadvantages in his road work. I remember that I gave up the original flexible sidecar partly because it was a terrible skidder, partly because the strain on the joints was such that the clips used to shift on the bicycle tubing; and so I dare not pronounce on the merits of this new flexible pattern without a road trial. I have often thought that there should be room for a flexible sidecar, given really substantial joints, affixed to lugs permanently brazed on to the cycle frame.



Pontoon bridge over the Trent built by the 2/1st Northumbrian R.E. The sidecar outfit, which is shown crossing the pontoon immediately after completion, is used for carrying despatches to and from the camp.



AROUND THE SCRAP HEAP.

By a Despatch Rider on Active Service.

At the Scrap Heap.

HAVE you ever experienced that sensation of grief, pity, and desolation as you gaze on your motor cycle after a too sudden familiarity with a steam roller? £60 worth of metal that had once conveyed you now a contortioned nightmare at your feet! A similar, but magnified sentiment comes upon one when roving round the scrap heap at —— base. These wounded warriors that formerly played such an heroic life at the Front are now but components of a scrap heap.

The Life of a Motor Cycle.

It is an open secret that motor cycles have only a short career out here, rarely, if ever, lasting longer than three months. Those machines that come to an end by being struck by shells or which run into Jack Johnson holes at 40 m.p.h. by night we can understand and forgive for breaking up; but then, the majority of machines are ridden behind the lines, to and from the base, and elsewhere, and for this ridiculously short life the reason must be found.

Their Final Condition.

The scrap heap is composed of all makes, including a sprinkling of nearly every well-known machine. Here is a —— minus belt and magneto, with a buckled wheel; here a ——, the tank splashed with blood, and a broken steering head. The tell-tale hand on the broken speedometer that happened to be fitted indicated 37 m.p.h. A —— had been ridden in *under its own power* in such a condition that it was marvellous that it went. The four engine bolt nuts were so loose that the carburetter could be seized in the hand, and it, with the cylinder head, moved bodily to and fro half an inch in either direction. In another case one piston ring only was left on the piston, also there was a cracked valve seating, a broken ball race in the magneto, and several other minor derangements. Further, another machine that looked brand new and in perfect order, on close inspection revealed the off front fork cracked at the lower end and the three-speed hub gear out of action. On another the piston rings were broken and cylinder badly scored through lack of lubrication. There they lie on the ground, one supported by the other, a spectacle of abject misery!

How they get Worn Out.

After a comparative inspection of the various machines the writer considers that the reason why the motor cycles do not stand up to their work is (1) continual fast riding over exceedingly bad roads and *pavé*. (2.) Individual machines passing through the hands of too many riders. (3.) The use of unsuitable lubricating oil. (4.) Lack of attention and adjustment. (5.) Bad handling and joy-riding.

Government Methods.

Something might be said about the Government methods employed out here, and a fair percentage of the blame hangs on their shoulders, so the less said on this score the better, although, after all, the responsibility in each small department depends on the organisation and initiative of an N.C.O. (usually a regular army man), the minor, yet important, details never reaching the officer in charge, especially as the men are not encouraged to criticise just now. What is wanted out here, and very badly too, is a "W.D." model, and there is plenty of time before the conclusion of this war to act in this matter. The following suggestions put forward should, however, be of use to those who design the machine.

Comparative Inspection.

A close inspection shows us that nearly all machines have been running with excessive play in the wheel bearings, due to wear, neglect, and lack of lubrication. The hubs are never cleaned. This calls for a dirt and waterproof hub made oiltight by internal packing and caps. Also a redesigned and larger hub oiler.

Engines.

With one or two exceptions where they were run without oil on urgent business, the engines as a whole are distinctly over-oiled. They show signs of having been flooded, for the oil oozes out everywhere, and the consequent carbonisation of head, heavier pistons, dirty sparking plug points, reduced exhaust pipe diameter, ports, choked silencer, etc., all help to reduce the efficiency of the power unit, and, formerly, where a hill could be climbed on top, low gear has to go in, and consequently the engine is raced unnecessarily. Drip feed is not giving satisfaction, for it depends too much on the idiosyncrasies of the rider, to say nothing of the glass being invisible at night.

An important fact that should not be overlooked is that the oil supplied for motor cycle use out here is, for the most part, water-cooled engine oil.

The Gears.

Of the many principles of multi-speed drives all are satisfactory, and usually only go wrong through lack of attention; especially is this the case with the three-speed hub. The way of fitting the gear box on a well-known machine is not happy, for when the threads on the holding-down bolts wear at the sides, the box when carelessly fitted may be bolted slightly diagonally to the frame, throwing the chain sprocket and belt pulley out of alignment. Elsewhere the speed lever handle is placed in an awkward position, throwing the centre of gravity of rider when changing gear into the wrong place at the critical moment where judgment in riding

is necessary, or possibly the handle may catch on his knee, or the actual gear change take too long.

The Ignition.

The wiring is not yet fitted in a businesslike fashion; the passing of a wire under the oil tank or pump should be avoided, as oil finds its way down the wire and on to the plug terminal.

The Carburetter.

In town the carburetter control levers are in continual use, and the sleeves or pistons in throttle and air barrels soon wear out, so, consequently, the engine can never be run slowly. The gauze filter over the air intake when screwed on should have some locking device. It is invariably missing.

Spring Forks.

Certain spring forks, while being ideal for comfort on good roads, are terrors on slippery places, and in many cases are not strong enough to withstand a hard bump.

Brakes.

Brakes are for the most part decidedly in the wrong place. Nearly all machines out here have had their front brake blocks removed because, directly the wheel is slightly buckled, the brake is useless, besides giving trouble in centring the wheel or when extracting it. With a slack bearing, the brake block, when applied, has been known to catch against a spoke and cause a nasty accident. The brake on rear wheel belt pulley places too much strain on the spokes. Why not fit special V brake drums on each wheel? They may be unsightly, but they are most certainly reliable in action.

Accessories.

Accessories have often been dealt with in these columns, but they are not sufficiently emancipated yet. They are too clumsy. The finish on small parts is invariably poor and soon rusts, whilst the fastenings are not up to the work. The serrated surface and nut principle is good in practice, but why omit the spring washer to hold the nut to its work? Put washers and split pins everywhere, especially on the carrier bolts, brake connections, mudguard fittings, and spring forks.

General Lubrication.

I should like to see the various small oilers on the machine redesigned and enlarged. At the present time the microscopic holes drilled in the frame, sometimes in inaccessible positions, devoid of any spring oil retaining device, are in no way suitable for their purpose. The oil hole is also too small or not adapted to take the nozzle of an oil gun, and the engine oil which is used will not pass the orifice. Further, no idea may be formed of how much oil, if any, has entered. One sees a small compression cock on a gear box for lubrication purposes. Why not a screw cap two inches in diameter through which one could see exactly what was in the gear box?

Oily External Flywheels.

As regards external flywheels, a leg guard would prevent oil leaking from a worn engine bearing being transmitted from flywheel to rider. The suggested form of guard to be a neat ¾in. flat leather-covered band of iron secured close across the flywheel parallel to the cross-bar of frame.

Handle-bar Grips.

When rough riding or on long journeys the handle-bar grips are found to be too small in diameter for comfort, and, also, accidents are frequently occurring through a grip pulling right off; especially the right-hand one when mounting quickly. Why not make these a permanent fixture?

The Right Machine in the Right Place.

At a base where three motor cycle orderlies are attached at least four machines, instead of three, should be provided. Say three lightweights for town work and a higher powered machine for long runs. It is asking too much of a lightweight machine to perform long journeys. A powerful machine is most unsuitable for town use.

Waste of Spares.

It is neither in the power nor in the interests of manufacturers either to curtail or economise in the matter of spares. This point lies entirely with the organisation out here. It is only fair to add that many things are scrapped when only a minor part is required to utilise them further, but this not being to hand a complete article is immediately requisitioned. Then, again, it is easy to obtain an expensive thing such as a tyre and tube (for the mere asking), or a front wheel—and in scrapping the old wheel, of course, the old cover and tube go with it—but little things like a magneto spanner, big end bearings, crocus powder, nuts, bolts, horn tongues, washers, etc., are practically unobtainable. Thus good material reaches the scrap heap. A generator is perhaps scrapped because a rubber joint had perished, a wheel because six spokes were broken, a horn and bulb because the tongue squeaked, etc. Although cycle parts are fairly plentiful a certain cycle frame for a time was not, and as there is neither time nor means of straightening up a slightly distorted frame, the new parts fitted in it are somewhat handicapped. This point should be borne in mind when judging what passes for a new machine.

On the future W.D. model adjustable handle-bars should be a standard feature; and be it noted that several machines have been scrapped solely because their ground clearance was too small.

Careless Fatigues.

Attention should be brought to the occasional gross carelessness of fatigue men. Motor cycles and side-cars in crates have been left upside down, one on top of another, or in positions imposing a strain on the machine, simply because the "drop tools hooter" went a minute too soon.

"Joy Riding."

Also in the repair shops work is sometimes hurried so that the afternoon may be spent in "testing," the machine being finally delivered in a "reckless" condition, maybe with the back tyre flat, and half the detail work that was to have been attended to totally ignored. Joy-riding is not confined to the workshop either! N.C.O.'s with no mechanical knowledge are often to blame. If the truth of truths were known the mileage of these poor machines might not prove so bad, but their actual duty to the W.D. is decidedly a short one, and it is surprising that manufacturers do not send out representatives to enquire into the rapid depreciation of their goods. The writer assures them that they would make some remarkable discoveries.

Tips in Selecting a Lighting Dynamo Outfit.

By ROAD RIDER.

SOME of the electricians who are hastily turning out electric lighting sets for motor cycles show a marked lack of practical genius in superficial details which the ordinary rider is well qualified to criticise, and a statement of the defects in the less perfect sets may save purchasers from blunders.

To commence with, every outfit should be sold complete with spare bulbs for all lamps, and the bulbs should be packed in substantial carrying cases because of their fragility. Household electric installations remind us how suddenly the filament of a bulb may collapse; on a motor cycle the bulb is subject to greater stresses, and as the bulb holders are by no means standardised as yet, it is not always possible to procure a spare even in large towns, whilst the machine must obviously be pushed to the nearest town if a bulb fails when there is no spare in the bag. The bulbs require very careful fitting into the carrying cases, because the glass tip is extraordinarily fragile.

Then it is absolutely essential that a detachable safety plug should form part of the switch block. Otherwise, whenever the machine is left standing in any public place from the kerb side to a garage, whether by day or night, some meddlesome loafer is sure to toy with the tumbler switches; and unless an interrupter plug is lying safely in the owner's vest pocket, a lot of current will be wasted in this way.

It is further desirable that one connection, either across the terminals of the safety plug, or elsewhere, should consist of a fuse wire, as this will prevent the accumulator from being rapidly exhausted by any accidental short circuit. Such short circuits are particularly probable on a motor cycle, composed so largely of metal, and so hopelessly exposed to moisture in wet weather.

All terminals should be thoroughly tightened up and inspected at frequent intervals, as a detached wire may mean the instantaneous failure of the light without so much as a flicker of warning, and if the machine is travelling fast in traffic or on a twisty road, an ugly smash may result. The connections should, therefore, be substantial—no finger-twisting of naked wire will suffice. Every wire-end should be firmly secured to a proper brass terminal ring, and soldered home, whilst the wiring itself should be strong. The terminal screws should be a good fit on their threads, and should be tightened up gently with pliers; if possible, packing material should be stuffed between them and the lid of the battery box, so that there is no room for them to jump off if they work loose. If the terminals are exposed, *e.g.*, on a top tube switch block, it is wise to paint the outside of the connection with a thick ropy paint, lest a terminal should fall off. In course of time, spring-locking terminals will probably be applied to such fittings; the plain screw terminal is literally dangerous. The vent plugs of the accumulator deserve special scrutiny. The vibration renders the acid specially liable to spray out, and if the plugs are slovenly in design or workmanship, the whole top of the accumulator will presently be covered with filthy corrosions, and the acid in the cells will cease to cover the tops of the plates. It can, of course, be replaced, but it is tiresome to be continually pouring in a little more acid.

E. J. Jack (3½ h.p. Rover), one of the eight competitors in the Irish twenty-four hours trial to make a clean ascent of Glengesh Hill. He is shown just past the first corner, and the dust cloud further back indicates the approach of another rider.

The Corbin-Brown Speedometer.

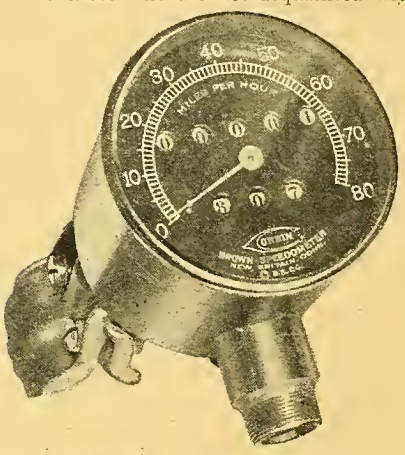
A SPEEDOMETER of American origin which is obtaining a considerable degree of popularity in this country at the present time is the Corbin-Brown, the agency for which has lately been taken over by Messrs. Brown Bros., Newman Street, Oxford Street, London, W.

Flexible shaft of the Corbin-Brown speedometer.

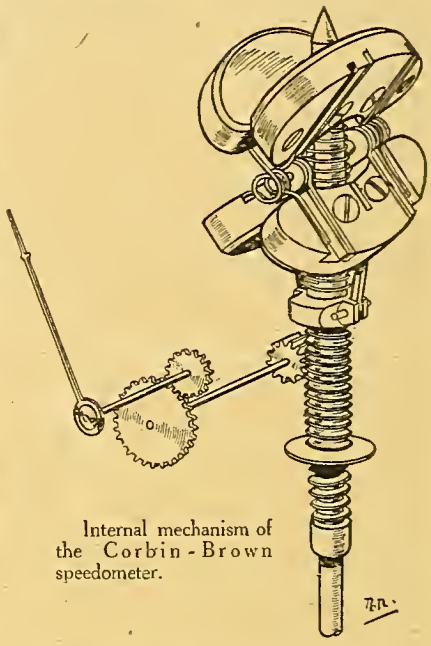
The instrument works on the centrifugal principle, and through the internal mechanism itself presents nothing startling in design, the accompanying sketch shows a slight departure from standard practice. This variation consists of the adoption of a governor working on the scissors principle. As the speed increases, the two balance weights tend to approach one another, and in so doing control the indicator hand, forcing it farther up the dial by raising the screw sliding on the main spindle. The mileage recorder and trip mechanism follow the principles which have been in vogue among speedometer manufacturers for some time.

An interesting point in the design of the driving sprocket, which in this particular case is attached to the back wheel, is the fact that this is made in two halves, bolted together by means of two short plates and screws. In the centre of the plate there is a projecting pin, the object of which is to ensure perfect alignment of both halves of the driving sprocket. It is therefore clear that it is not necessary to take down the driving wheel on the motor cycle to fit the driving mechanism of the speedometer—a point which will be much appreciated by those amateurs who desire to fit the speedometer themselves as it means a considerable saving of trouble.

To those who are not acquainted with American machines, it may be pointed out that the usual position for the Corbin is on the top tube. The Corbin-Brown speedometer has a black dial with white letters, which are easily discernible. The instrument is well made, and can be driven from either front or back wheel.



The Corbin-Brown speedometer, which has a black dial.



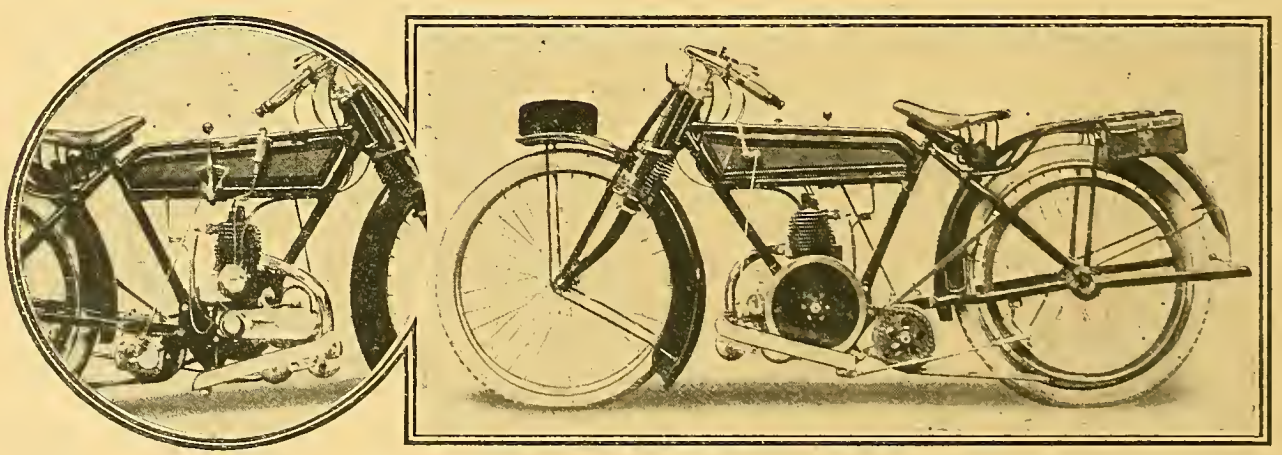
Internal mechanism of the Corbin-Brown speedometer.

A New Two-stroke Lightweight.

THE latest addition to the ranks of the small two-stroke is known as the Sheffield Minor, and is handled by the Colmore Depot in Birmingham. The machine has a striking appearance, owing partly to the sloping top tube, which is also slightly dropped at the rear end. The power is supplied by a Villiers two-stroke unit, and the transmission is either direct by belt or by chain and belt through the medium of an Albion two-speed countershaft gear.

Lubrication is by sight feed drip to the inlet pipe, whence the oil is distributed in the form of vapour. 26in. × 2in. tyres are fitted, the mudguarding is well carried out, and the machine is finished in black and green.

The fittings are noticeably good and include aluminium footboards, armoured pannier tool bags, heavy type Druid forks, and large pan seat. The saddle is unusually luxurious for a moderately-priced machine.



The Sheffield Minor, the latest recruit to the list of two-stroke lightweights. The model illustrated is fitted with chain-cum-belt drive and two-speed Albion countershaft gear.

B.S.A. on War Service

Belgian Soldiers with B.S.A. Motor Bicycle used for Despatch Riding with the Belgian Headquarters Staff.

Photo lent by The Morris Garages, Oxford, who supplied above machine.

Our Allies, no less than British riders, praise the efficiency of B.S.A. Motor Bicycles. They know by experience that—at the critical moment—B.S.A. material and workmanship can be relied upon to stand the severest test.

JOHN PIGGOTT'S JULY SALE

68 PAGE LIST FREE.

MOTOR CYCLISTS' OVERALLS. FOR WIND, RAIN, or DUST. **WATERPROOF DEPARTMENT.**
All Garments are guaranteed absolutely Waterproof. All Seams stitched through, overlapped, cemented, and taped.
When ordering Motor Suits, please state Chest Measure taken over jacket worn, and inside Leg Measure.
OUR FAMOUS "J.P." TOURIST OVERALL MOTOR SUIT.—Strong and Waterproof, made of extra stout untearable Fawn Twill, double texture. This material is specially recommended to stand the hard wear that Overalls usually get. **The Jacket** is made double-breasted, 36in. long, with Prussian collar, throat tab, inside wind cuffs, adjustable, tabs on sleeves, square pockets stitched right through, cut roomy, with loops for belt. **The Trousers** are made in the Seatless Overall style, with spat and gaiter front, storm gusset, lever clip fastening leather waist and boot strap, and shaped to fit well up in fork of leg. **This Outfit complete is offered during the Sale only at 30/6.** Usually sold 40/-.
JACKETS ONLY, **20/3.** Usual price, 21/6.

MOTOR CYCLISTS' DUST OVERALLS.
Olive Heavy Twill Drill Double-breasted Jackets and Seatless Gaiter Trousers (heavily rainproofed). Usual price, 28/-. **Sale Price, 23/4.**
Sizes stocked, 36 to 44 chest.

EXCEPTIONAL OFFER. SHOWER AND DUSTPROOF MOTOR SUIT in Olive Twill, very strong. The Jacket is Double-breasted, fitted with elastic wind cuffs, the overalls fasten with side strap to brace buttons, are easily slipped on and off, and the spat is kept in position by small strap, making a most sightly and useful Suit. Worth 25/-. **Our Special Price, 16/-.**
36 to 44 chest in stock.

Shower and Dustproof SEATLESS GAITER TROUSERS. Fitted with Gusset and Patent Fasteners at side, easily slipped on, in the following sizes only:
Sale Price, 9/6 Postage 4d.

Waist	32	32	34	40	40
Leg	31	33	33	31	33

Shower and Dustproof LEGGINGS, fitted with Gusset and Patent Fasteners and Side Strap to fasten on brace buttons. **Sale Price, 7/6.** Postage 3d.

WATERPROOF CAPS TO MATCH The "J.P." TOURIST MOTOR SUIT.
Usual price, 4/6. **Sale price, 3/11**
Postage 2d.

OVERALLS MADE BY A PRACTICAL RIDER

Are the most satisfactory, because the man who rides knows what is wanted.
I have been experimenting for over ten years with materials and styles of cut, and I have tested them out on the road. This means satisfaction to you as it did to the writer of the following unsolicited testimonial:
Sept. 28th, 1914.
I am more than pleased with overalls. They are better in every way than I expected, and I am glad I struck your advert. I shall be glad to recommend your firm. It's a treat to get such satisfaction. You may use this as a testimonial. Yours truly—W. G. Adams, Estate Agent, Swindon, Wilts.
My Booklet will interest you—send for it to-day.—Irvine Smith.
MOSLEY & SMITH
Buttershaw, Bradford.

14, North Street, Bishop's Stortford, Herts. April 18th, 1914
Dear Sirs,
On Feb. 5th last you were good enough to send me a non-return release valve for crank case for my motor cycle on which I had fitted an "Enots Drip Feed. I should like to express my appreciation of the working of the "Enots." It has made an enormous increase in the power, ensuring at the same time correct lubrication.
I remain, Yours truly,
S. A. Milbank.

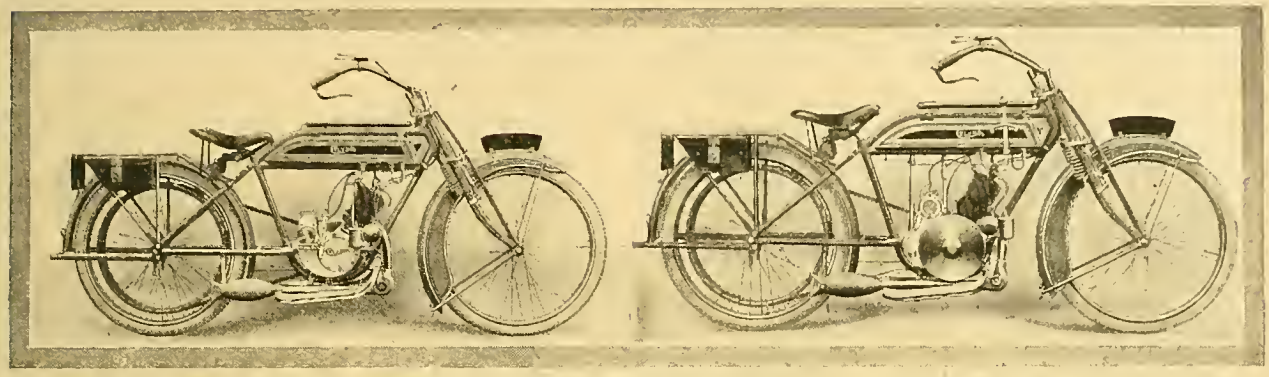
Mechanical Features of the Two-stroke Clyno.

A MACHINE WITH SEVERAL EXCLUSIVE FEATURES.

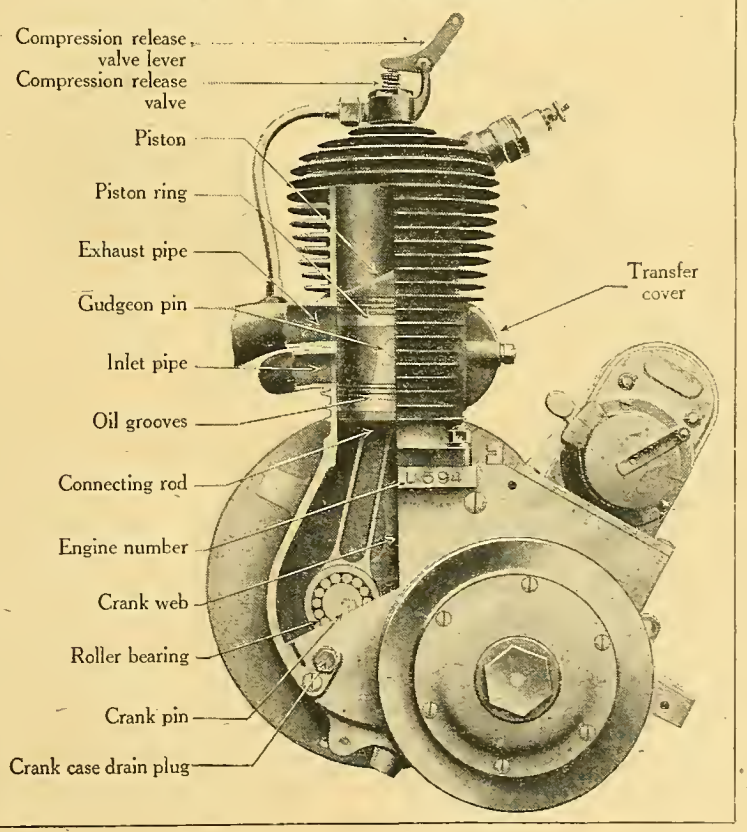


Two editions of the two-stroke Clyno—single-geared model (left) and two-speed model (right) The main outward difference is the location of the flywheel on opposite sides.

READERS will remember that we have already published details of the alterations in the 1915 Clyno two-stroke models. At the time, however, we were unable to give an illustration of the complete machine, and, as the Clyno Engineering Co. have embodied so many unusual features in their design, it may be of general interest to recapitulate the main items in construction. In addition to an open frame ladies' model, the Clyno is marketed as a single-geared or two-speed mount with a cylinder bore of either 70 mm. or 76 mm., the stroke being 70 mm. in either case. We propose to deal with the 70 × 70 mm. two-speed mount as being typical of the firm's production. Incidentally, it is a mount with which we have had a year's most satisfactory riding experience.

The Clyno two-stroke has the distinction of being one of the very few two-stroke machines which is designed and built throughout (with the exception of electrical fittings, tyres, etc.) by one firm, and the result is obvious in the neatness, practical layout, and detail work of the whole machine. One would, of course, expect such a result.

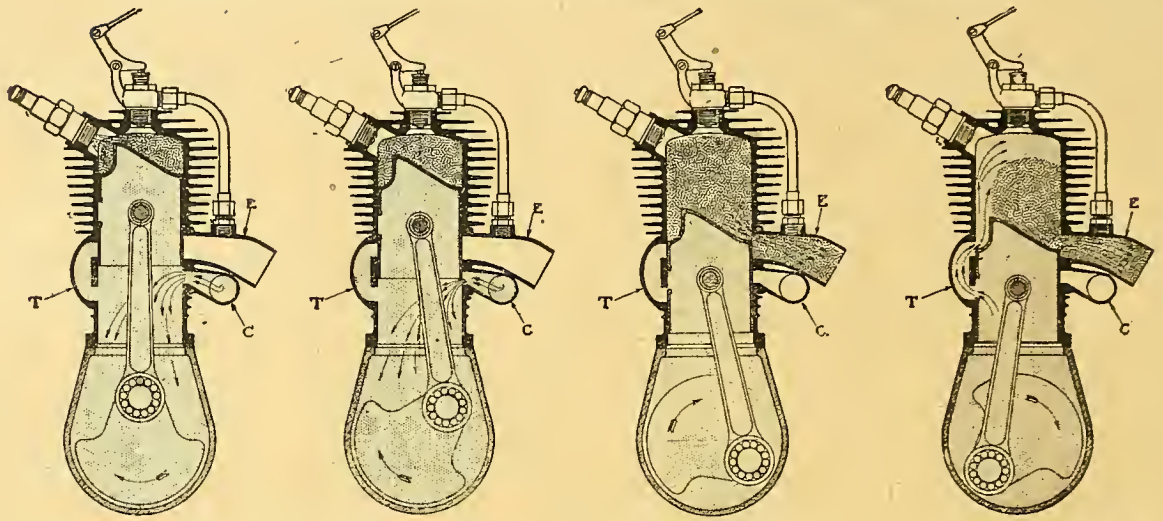
PART SECTION OF CLYNO TWO-STROKE ENGINE.



The Power Unit.

Naturally the engine and gear unit is the most interesting item from a motor cyclist's point of view. Here we find many unique features, such as the totally enclosed flywheel, the absence of a chain from engine to gears, and the protected multi-plate clutch. It is not generally realised that the engine of the two-speed Clyno runs backwards, though this apparently unimportant detail has more than one good result. The cylinder slopes forward to a considerable degree, and, as the engine runs in the reversed direction to the usual practice, the balance is improved to a slight degree. In front of the cylinder are mounted the exhaust and inlet pipes, the former directly above the latter, and at the back of the cylinder lies the detachable transfer port cover, which is instantly removable after loosening two set pins. Thus it is quite possible to clean the piston head without removing the cylinder. The latest model is fitted with a pipe from the release valve in the cylinder head to the exhaust pipe, which does away with the noise and oily vapour emitted by the unenclosed release valve.

CYCLE OF OPERATIONS ON THE TWO-STROKE CLYNO.



(1) Compressed charge on point of firing; exhaust and transfer ports closed; inlet port open, showing gas filling crank case and lower part of cylinder.

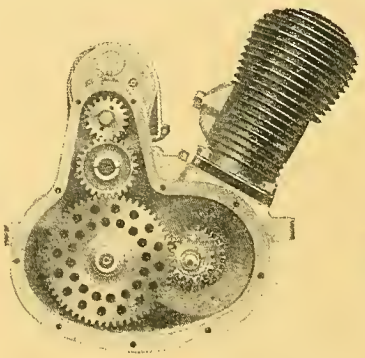
(2) Commencement of explosion stroke; inlet port partly open; transfer port and exhaust port closed.

(3) End of explosion stroke; exhaust gases commencing to pass out; inlet port and transfer port closed: gas in crank case almost fully compressed.

(4) Piston rising; exhaust and transfer ports open; inlet port closed; fresh charge passing into cylinder *via* transfer port and deflector plate; exhaust gases (darker shading) passing out.

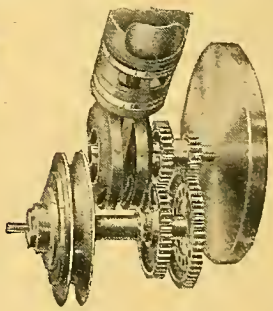
C, inlet pipe E, exhaust port. T, transfer port.

The gear box is unusual, though particularly simple. Two gear wheels are mounted direct on one side of the crankshaft and lie between a plain bearing in the crank case and a roller bearing which takes the weight of the flywheel, a second roller bearing is mounted on the other side of the crankshaft, and the whole shaft is held up to the face of the plain bearing already mentioned by a light spring and ball thrust, and thus prevents compression leakage. These two gear wheels mesh with a pair of large gears mounted on the gearshaft. One of these is loosely mounted, but the other is capable of a sliding motion only, being mounted on keys. The sliding wheel is fitted with a series of pegs in one face arranged so as to correspond with a series of holes formed in the loose wheel. When both pairs of gears are in mesh the loose wheel revolves independently of the gearshaft, and the high gear is obtained through the sliding wheel, thence through the clutch, which is mounted on the gearshaft and carries a 6in. belt pulley. If, however, the sliding wheel is moved across it first of all comes out of mesh with the wheel on the crankshaft, and then the pegs engage in the holes in the loose wheel, thus locking the loose wheel to the gearshaft and clutch so that the low gear comes into action. There is a slight knack in changing up, but once this is acquired the change can be made in silence with the greatest certainty; changing down is simple to an extraordinary degree.



(Left) Magneto drive.

The frame is of the loop type, and the engine and gear box rest on flat lugs, being held thereto by long screws and nuts, consequently the power unit can be removed, if necessary, with the greatest ease. The magnéto is gear-driven from the gearshaft, only six gear wheels being employed in the whole unit. Frame details and fittings are unusually complete and excellent, and the long curved-up aluminium footplates protect the rider's feet and legs, besides providing a comfortable riding position. An additional silencer on the end of the exhaust pipe of the 1915 models has considerably reduced the noise, and a new system of crankshaft building wherein the crankshaft is divided into two parts only forms perhaps the most important alteration since last year.



(Right) Change speed gear incorporated with crankshaft.

Engine Details.

The new crankshaft simplifies construction and ensures a true crankshaft, which it is difficult to obtain in the three-piece type. The big end bearing is of the roller type, and the gudgeon pin is fixed to the connecting rod, the ends of the pin being free to oscillate in bearings in the piston boss. This is an important point, as it relieves the piston of the strains imposed by a "drive in" gudgeon pin and reduces the liability to warping. The Clyno claim to have got over the difficulty of sticking top piston rings by replacing the top ring by a series of narrow grooves. The second ring remains as before, but a ring is now

MOTOR CYCLE
A·M·C
HORN

FOUND AT LAST!

An effective, reliable, durable, and economical Warning Signal for motor cycles and sidecars. The new "A.M.C." Electric Horn clears the road, gives no trouble, and will last for years, rendering it ideal for use on motor cycles and sidecar machines.

The current consumption does not exceed ½ amp. at 4 volts. A dry battery will give one to two years' service with intermittent use; the extra load on a lighting set is practically nil.

The instrument is British made throughout, an ornament to any machine, and is provided with means for adjusting the pitch of the note.

Please send Postcard to-day for latest illustrated booklet.

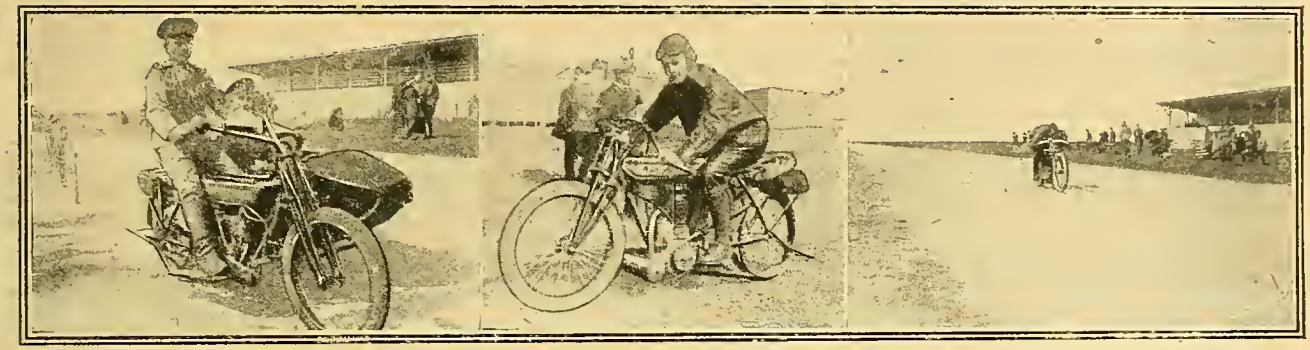
Mechanical Features of the Two-stroke Clyno.—fitted in the skirt of the piston. Lubrication remains on the "petroil" system, oil being pumped direct from the oil tank into the petrol. Much has been said both against this system and in favour of it, and we must confess to having found it absolutely satisfactory provided the right quantity and quality of oil were used. The magneto control has now been moved to the handle-bar, and the compression has been slightly lowered. We cannot say more in favour of the little Clyno than that practically every detail which appeared to us, after many thousands of miles of use on an early 1914 model, to be open to criticism has been improved in a most satisfactory manner.

All Russian Motor Cycle Speed Trials.

New Records made by a British Machine.

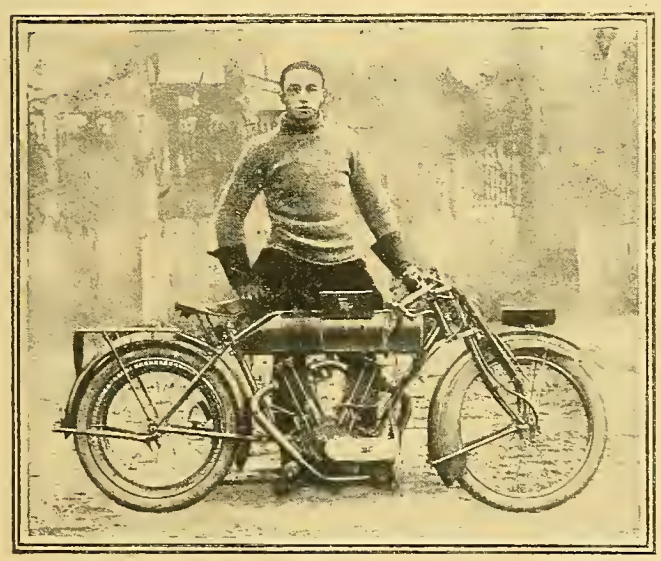


SPEED TRIALS AT PETROGRAD.

Reading from left to right: Enfield passenger outfit, the driver of which made fastest time in the sidecar class. The rider of the Rudge who lowered the Russian record for the 500 c.c. flying verst (1,116⅔ yards), speed 62.5 m.p.h. A T.T. Triumph at speed.

THE annual Russian speed trials were held on Volkonskoe Road, Petrograd, on the 13th ult. There were some forty entries, and the weather was warm and pleasant, a great contrast to what was experienced in the Winter Trial (an exclusive account of which was given in this journal), when so much trouble occurred from over-heating, slipping belts, and difficult starting.

Unfortunately, a bad accident to a Russian Army despatch rider, resulting in a broken leg, caused the commanding officer to order the retirement of the military section, who were for the most part mounted on American machines. This naturally caused some loss of interest and damped the spirits of those present not a little; however, some excellent performances were witnessed, and the previous Russian record in the 500 c.c. class went by the board, being beaten by the rider of a Rudge, who covered the verst at a speed of over 62 m.p.h., while the fastest time of the day was made by a Matchless fitted with an overhead valve J.A.P. engine, which almost reached a pace of 65 m.p.h.



Fastest time of the day, *i.e.*, 64.9 m.p.h., was made by the rider of this 8 h.p. twin-cylinder Matchless at the Petrograd speed trials.

The verst, which is rather more than a kilometre, was covered first with a flying, then with a standing start, and the times were taken electrically; thus any possible source of error in the timing was eliminated.

There were three classes as follow:

CLASS A, 500 c.c., OPEN, FLYING START.

1.	Rudge	38⅖s. = 62.5 m.p.h.*
2.	Rudge	39⅗s.
3.	Triumph T.T.	41⅘s.
4.	Triumph T.T.	43⅘s.
5.	Triumph	46⅕s.

*Russian record.

CLASS B, 500 c.c., HANDICAP ON PREVIOUS TIME, STANDING START.

1.	Rudge	54⅗s.
2.	Rudge	56⅘s.
3.	Triumph T.T.	57⅕s.
4.	Triumph T.T.	58⅖s.
5.	Rudge	62⅖s.

CLASS C, 1,000 c.c., OPEN.

1.	Matchless	37s. = 64.9 m.p.h.*

*Fastest time of the day.

CLASS D, SIDECARS.

1.	Enfield	66⅖s.
2.	Premier	67⅕s.
3.	Sunbeam	68⅕s.

The Dunlop Rubber Co. and the War Loan.

We hear that in order to encourage investors to assist the country in the present emergency, by investing in the new War Loan, the Dunlop Rubber Co. have made an offer to the debenture holders of the Parent Tyre to redeem outstanding debentures upon favourable terms for cash a year before the due date. This offer is being largely accepted.

Sidecars for Service in Russia.

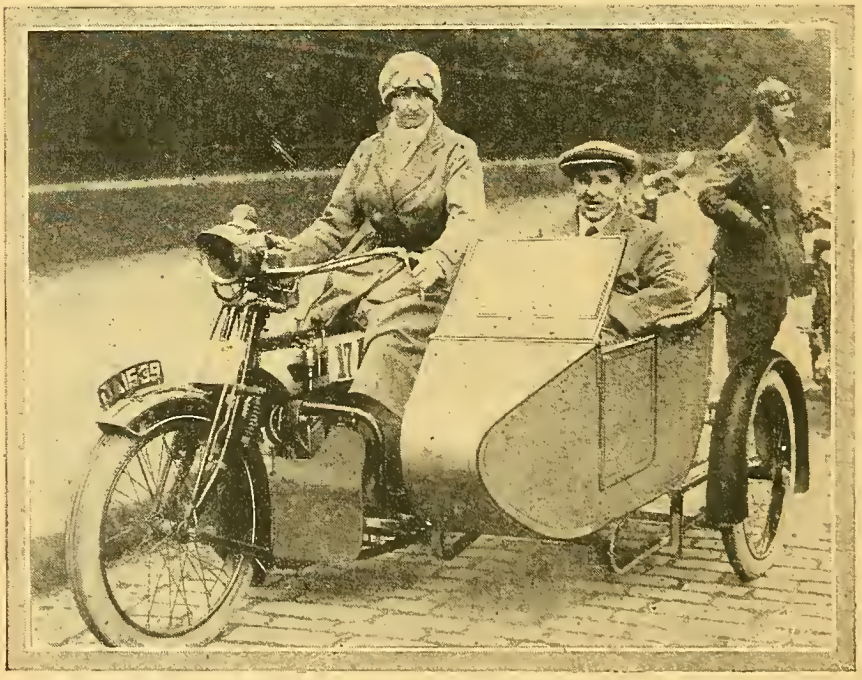
Our Russian correspondent asks us to draw British manufacturers' attention to the fact that, owing to the new police regulations and the rule of the road to keep to the right, sidecars shipped to Russia should be fitted on the right-hand side of the motor cycle. There are quite a number of British sidecar machines in the Petrograd district, including Sunbeams, Enfields, and Premiers. The Indian is the most popular of the American makes at present.

Junior T.T. Winners as Despatch Riders.

Last week Corporal Eric Williams, D.C.M., was home for a few days' leave, when we had the pleasure of a few minutes' chat with him. Williams hails from Hereford. A Wolverhampton paper refers to Cyril Williams—second to Eric Williams in the 1914 Junior T.T.—as sergeant, but this is premature.

Reliability Trial in the Transvaal.

Maritzburg, Transvaal, motor cyclists held the reliability trial for the Barns trophy on Union Day, May 31st. A circular route was adopted, giving a total distance of 144½ miles. There was one official stopping place, and the time allowed for this was only half an hour. The trial was run off successfully, but there was a good deal of tyre trouble, which put many competitors out of the running. Provisional results gave a tie for first place between C. Weeden (3½ h.p. P. and M.) and V. E. Williams (3½ h.p. Rudge). Second and third places go to W. E. Charlwood (7-9 h.p. Indian) and R. G. Goodwin (3½ h.p. Triumph) respectively. Marks were awarded on non-stop run, times at secret and open checks, and condition of machine at finish.



The only lady competitor in the Glasgow M.C.C. twelve hours trial, Miss Runciman, who drove an A.J.S. passenger outfit. The event is described on page 43.

An Appeal for Army Motor Cyclists.

Recruiting for the Motor Machine Gun Service is now re-opened. Motor cyclists who wish to join the Army—and every able-bodied rider should respond to the call—will find all details in the Recruiting Section on page 42 of this issue.

Second-hand Prices.

We give below the average prices of the various second-hand models offered for sale in the last issue of *The Motor Cycle*, and also the average prices for the last eight weeks. The prices quoted may be regarded as their standard value.

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.
A.J.S.	1914	2¾ 3-speed	£40	£43
,,	1913	6 2-sp. sidecar	£52	£57
Ariel	1913	3½ 3-speed	£35	£35

,,	1913	6 Gradua sidecar	£45	£43

Brave Motor Cyclist's Death from Wounds.

There have been comparatively few casualties in the Motor Machine Gun Service, though it is not to be expected that the brave motor cyclists who compose the ranks are at any time free from danger in view of their presence in the firing line. Another member of the No. 5 Battery (the Coventry Battery) to give his life for his country is Sydney Reginald Stebbing, son of the handmaster of the 1st Batt. Royal Warwickshire Regiment. Stebbing was one of the first to answer the call, enlisting last November, and died from wounds received in action at Zonnebeke, Flanders, and is buried in Hazebrouck Cemetery. He was one of the three battery scouts, and is seen in the accompanying photograph mounted on a Douglas.

Sydney R. Stebbing, killed in action in Flanders.

Clubs and the War Loan

It is interesting to note that the A.C.U. has invested £1,000 in the War Loan. The Cyclecar Club also proposes to invest its funds in the loan. In last week's issue of this journal, Mr. N. T. Downs made the suggestion that clubs should invest their funds in the loan, and we appended editorial support to the suggestion.

The Late Captain Anthony Wilding.

A correspondent in last Saturday's *Daily Mail* writes:

"Beside a lonely, rubbish-strewn path which not very long ago had been a country road, I saw yesterday the grave of Anthony Wilding, the lawn tennis champion, who met his death by the chance of a stray shell. He was riding a motor cycle along this road when a German shell burst just in front of him. It is, I think, a sound rule in these cases to go straight on, for the Germans generally drop one or two shells about the same place.

"A dug-out was close by, and Captain Wilding took cover in it to wait till the shelling ceased. In the dug-out were an officer and some men of the Suffolk Regiment. The very next shell fell into the dug-out and killed the inmates. Wilding lies buried close to the road with the Suffolk officer and his men. A plain wooden cross, with his name and the date of his death inscribed in indelible pencil, marks his resting place."

Army Pay Again.

We notice that a Scottish contemporary protests against 6s. a day being paid to unskilled motor drivers and only 1s. 2d. a day to men (including many motor cyclists) who are regularly risking their lives in the trenches. It will be remembered that *The Motor Cycle* has had more than one growl on this same topic, and as a result a question was asked in Parliament, but the authorities still remain steadfast.

New American Track Record.

The American 100 miles dirt track record was lowered on June 13th on the Detroit course (an oval mile), when an Indian rider, Jim Davis, covered the distance in 88m. 6⅘s. (68.1 m.p.h.) There were eighteen starters, and altogether it appears to have been an exciting race. Second and third places were secured by riders of Harley-Davidsons. Previous record time for the 100 miles was 92m., made by an Excelsior in 1913.

The War Funds.

That the principal war funds continue to receive strong support is borne out by the following figures, taken on Tuesday last:

The Queen's Work for Women Fund	£160,754
The Times Fund	£1,520,970
The Daily Telegraph Belgian Fund	£148,763

The Lord Roberts Memorial Fund is approximately £50,000.

A.A. and M.U. Notes.

COLOURED FRONT LIGHTS ON MOTOR VEHICLES.—Although the new Order in Council (under the Defence of the Realm Act) prohibiting the use of colours in reducing the intensity of light shown by lamps on motor vehicles has been in force since June 10th, it is noticeable that numerous motorists, apparently ignorant of the new regulations, continue to use coloured "dimmers" or coloured glasses in their front lamps. Obviously a red light shown in front would be the source of considerable risk.

Sidecar Runs for Wounded Soldiers.

Motor cyclists of Torquay have set a splendid example to others throughout the country by the system of regular sidecar outings for wounded soldiers that they have organised. Since last October runs have been arranged for every Wednesday and Saturday afternoon, and now that settled weather has arrived picnics are being held. The joint organisers, Messrs. A. E. Williams and P. J. Gilley, tell us that the trips are most appreciated, and eagerly looked forward to by both wounded British and Belgians in the local hospitals.

Another Spanish Road Race.

Since publishing in our last issue particulars of an 130 miles road race organised by the Motor Club of Madrid, news has come to hand of another long-distance race—this time over a distance of 210 miles—held in Spain. The course was over twisty and mountainous roads, and the last sixty miles were made very trying owing to a heavy downpour of rain. First and second places were taken by riders of 3½ h.p. twin-cylinder Indians, they being the identical machines used in the 1914 T.T.

THE WEEK-END FLOODS.

A flooded road near Castle Bromwich, Birmingham. The photograph, which was taken on Monday last after the heavy thunderstorms of the week end, shows a Harley-Davidson passenger outfit that came through the water without a hitch.

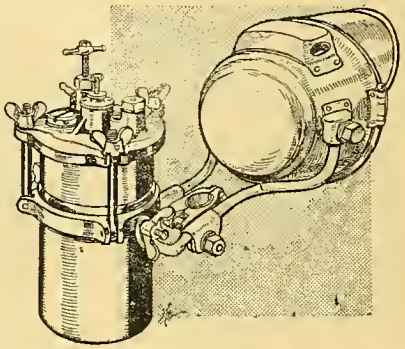
A New Low Motor Cycle Generator.

IT was in the issue of *The Motor Cycle* of October 8th, 1914, that we described the first pattern Low generator. This was suitable for light motor cars. Since that time several members of our staff have tried the generator, and have found it to be most satisfactory, "Ixion" especially having commented on it in most favourable terms.

The motor cycle pattern has been some time in being put on the market, chiefly owing to shortage of labour and material, caused by the war. Now, however, the Low Generator and Engineering Co., 19, Craven House, Kingsway, W.C., have the first batch of these generators ready for delivery.

The motor cycle generator embodies the principles of the light car pattern, but has been altered to suit the conditions prevailing on a motor cycle. The pressed steel body has a ring in the centre, round which the clamp goes, enabling the latter to secure the top firmly against the top of the body. On the clamp ring are the screws which attach the generator to the bracket, and the wing nuts on these cannot be lost, as there are small rings at the ends of the screw bolts which prevent the nuts from coming adrift. An important but small improvement is the provision of a large filler cap on the top of the generator, by means of which water can be introduced into the water tank. This is provided with a large slot running across it, so that it may be opened with a coin.



New Low motor cycle generator attached to lamp.

The water vent is incorporated wit the safety valve, the object being prevent the water from splashing ab owing to the vibration on the handle-b

The water and gas outlets are q separate in this, the latest Low generat The top is provided with three proj tions like fork ends, into which the b and wing nuts of the clamp fit, and e one of these fork ends has the extremi projecting slightly, so that, even if o of the wing nuts is not tightly screwe there is little chance of it coming adrif

The whole device is well made an well finished, and we prophesy a ver good future for this interesting fitment which is the only pressure type o generator which can be charged at hom by the motor cyclist himself. Naturally, in the case of a motor cycle generator the container for carbide is a good dea smaller than that used in the light c pattern, but a spare can be easily carr on the machine or in the rider's pock

In conclusion, we may add that t generator works better with a sm burner than with a large one, and nearly every case a smaller burner th standard should be employed.

Results of the Irish Open Trial.

B.S.A. and Indian Machines Tie for Premier Award.

THE awards in connection with the twenty-four hours open trial of the Dublin and District M.C.C. from Dublin to Donegal and back, reported in the last issue of *The Motor Cycle*, have been announced. It will be remembered that of the thirty-five competitors in the trial thirty completed the course, and as none of them was more than thirty minutes behind scheduled time at the finish, all of them qualified for some form of award. The conditions necessary for the winning of a gold medal were that a clean ascent of Glengesh should be made at the first attempt, and not more than ten marks should be lost otherwise.

Nine of the competitors climbed Glengesh, but one of them, G. Hartigan (3¾ h.p. Scott), lost the total number of marks, 200, owing to his being four hours late at the second control at Belfast. J. C. Cunningham (4 h.p. Bradbury) and D. Doolin (10 h.p. A.C.) lost two marks each for a tyre repair in a non-stop section. This left six riders with the maximum number of marks, 200, and their placings were determined by taking into consideration the total variation from schedule time at the three secret checks taken on the last stage of the trial.

W. H. Freeman (7-9 h.p. Indian) and T. Toole (4 h.p. B.S.A.) were found to have least variation, viz., 59s., and were therefore declared joint holders for the year of the Rudge-Whitworth Cup, each receiving a miniature of the cup and a gold medal. J. Doleman (3½ h.p. Rover), 79s. variation, and R. Walshe (4 h.p. B.S.A.), 107s. variation, were placed third and fourth respectively, for which they also received gold medals.

The cup presented by Mr. S. H. Manthorpe for the best performance on a passenger machine was won by D. Doolin (10 h.p. A.C. cycle car), whose mount was the only passenger machine to make a clean ascent of Glengesh.

There was no award of the prize for the best performance on a 500 c.c. sidecar machine, as the only two machines of that type which completed the trial—C. Taylor's 3½ h.p. P. and M. and W. H. Allen's 3½ h.p. Sunbeam—did not secure the qualifying number marks, viz., 180.

The prize for the best performa on a single-geared machine was also awarded, as the only rider of a sing geared machine in the trial, D. S. D (2¼ h.p. New Hudson), did not compl the course.

The lightweight prize for the b performance on a machine of unc 275 c.c. was won by J. F. A. D (2¼ h.p. Sun), who secured the high marks of the three riders on simi machines that completed the trial.

The inter-city contest between Dub and Cork was won by the Dub quartette, made up of Franklin (Indi sc.), Freeman (Indian), Browne (Rove and Roche (Rover), whose total mar amounted to 770, as against 722 scor by Jack (Rover), Swanton (India Dooly (B.S.A. sc.), and Engli (Douglas).

The team prize for the best perfor ance of a team of three riders was w by the trio consisting of Freem Franklin, and Mooney, who, by t way, also secured the team prize in t Cork "20."

MOVABLE LAMPS.

IN view of the recent stringent regulations relative to the use of movable head lamps with the usual type of brackets, an invention of the Austol Co., 7, Adolphus Road, N., which we have recently had brought to our notice, is of interest.

Lamp regulations under the Defence of the Realm Act prohibit the use of bead lamps which swivel on their brackets, the aim being to prevent the use of such lamps for signalling purposes. The swivelling lamp being more extensively used than the fixed pattern, and in view of the fact that several heavy fines have been inflicted and lamps confiscated, the knowledge that such lamps can now be adjusted to conform, by means of the invention referred to, with the new regulations at a small cost, should prove welcome to many riders.

Owing to the patent arrangements n yet being quite complete, a descripti of the fitment at the present time withheld, but we may say that it c be attached to any existing lamp, a renders any attempt to swivel the lar impossible. The method of attachi or detaching can be carried out exactly the same manner as befo either by the thumbscrews attached the usual nuts.

LEVIS INNOVATIONS.

A Test Gradient of 1 in 3. The New Two-stroke Horizontal Twin Model.

WE have already mentioned the new test track which has been constructed at the works of Butterfields, Ltd. (makers of the Levis), adjoining Stechford Station, near Birmingham, and last week we had demonstrated to us the lightweight Levis making easy work of an actual gradient of 1 in 3 on the hill in question. Before examining the test hill, we were taken through the new extensions of the works, and while inspecting one of the stock rooms on the top storey heard a roar overhead reminiscent of thunder, but which proved to be none other than machines being put through their tests. The length of the test gradient is twenty-seven yards, and we were told that the record time for the ascent was 3½s. Twenty-seven yards does not seem a very extensive test for a new mount, but when it is remembered that there is no room for a flying start, eight yards being the limit of flat, it will be seen that a lightweight must be in really good tune to maintain a speed sufficient to carry it over a 1 in 3 grade.

Single-geared and with a Passenger on the Carrier.

After seeing a two-speed 198 c.c. Levis reach the roof like a rocket, we were treated to the spectacle of a 2¾ h.p. single-geared machine going through a similar performance. The gear ratio of the latter, when measured, was found to be 8½ to 1, but the performance was later eclipsed by the rider (who weighed 138 lb.) taking a passenger on the carrier who weighed 140 lb.

As a matter of fact, the ascents were really hair-raising, as the rise ceases suddenly as the lead topped covering of the flat roof is reached, and it is ten yards ahead to a low parapet marking the front of the works! A ride up the Levis test hill is not to be recommended to anyone with a dislike for thrills, nor should a machine be taken up or down without the most powerful brakes.

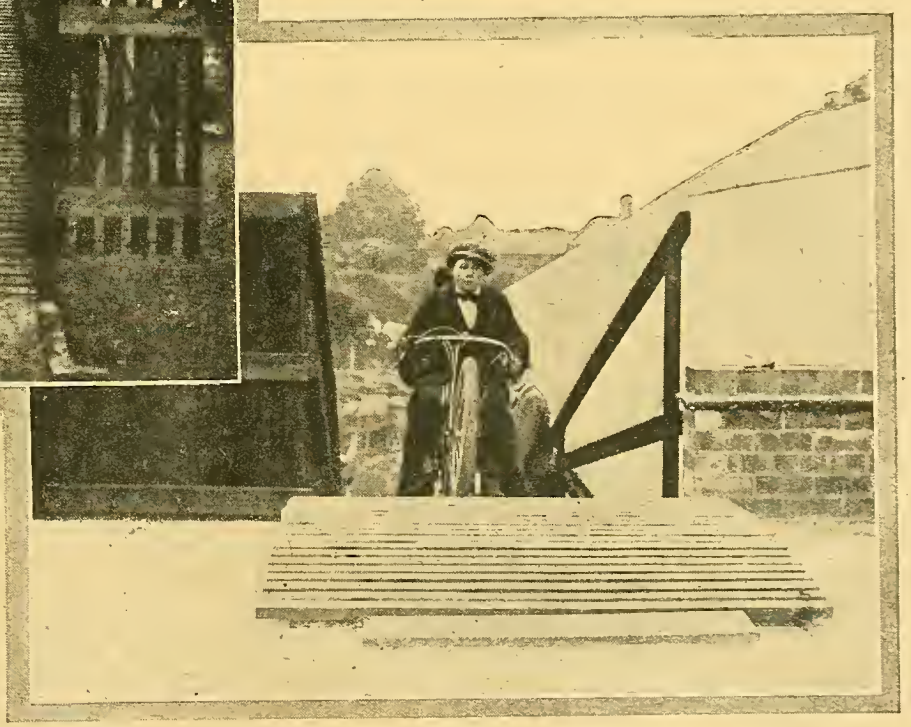
Messrs. Butterfields have not yet finished their extensions. They propose to construct a track around the works which will give them ten laps to the mile, and on each of the four corners will be erected a 4ft. 6in. banking.

While at the Levis works we were treated to a trip on a new horizontally opposed two-stroke twin, the engine of which was described in detail in our issue of May 6th, p. 432. This machine had been built up in an experimental frame, which was admittedly not particularly pleasing to the eye, but as the engine was originally built up as an experiment it has served its purpose. The performances of this new Levis twin, as related to us by the makers, were such that we expected something good, but the vim and kick of this latest two-stroke were a revelation. With chain and belt transmission it had a single gear of 5 to 1.

A Run on the Twin Two-stroke Levis.

A separate carburetter had just been fitted for each cylinder, and, starting off with one cylinder firing, the other was soon brought into operation, and we had the experience of being bowled along at nearly a mile a minute in a frail sidecar devoid of cushions or upholstery of any sort. We must confess to being startled at this unexpected turn of events, but, at any rate, Mr. Newey had convinced us that there is more in the horizontal twin Levis than we at first realised as we gazed upon it reposing innocently in a corner of the works; it is a speed machine of the first order.

When the Levis Co. have time to settle down to complete this new engine, it will have water-cooled cylinders, the jackets being made of aluminium and screwed on to the cylinder casting. With a chain drive and an Enfield two-speed gear, this machine should be capable of anything required of it in the way of either solo or sidecar use.



Views of the Levis 1 in 3 test hill from above and below. Although only twenty-seven yards in length, the hill is a good test by reason of the short start on the flat allowed.

"The Motor Cycle" Recruiting Section.

Motor Cyclists now Wanted in the Motor Machine Gun Service.

THE Editor's appeal in the last issue for fifty first-class motor cyclists for immediate service in the Motor Machine Gun Batteries met with a splendid response. On Friday there were seventy-five, on Saturday forty-two, and on Monday seventy-seven applications.

The undermentioned were inspected and attested at Coventry last week, and are now at the training centre, whilst a further batch of recruits were to be interviewed by Mr. Geoffrey Smith, Editor *The Motor Cycle*, at the Recruiting Office, Masonic Buildings, Little Park Street, Coventry, yesterday (Wednesday) :

L. A. Bees	A. J. Clarke
W. T. Harrington	R. Peberdy
A. H. Lines	R. Allen
W. J. S. Bewley	W. H. Ash
J. Chambers	T. B. Maloney
S. Lightfoot	W. Thacker
R. Tomlinson	H. Clayton
E. G. Whitehead	

Since the last announcement Mr. Smith has received instructions from the Commanding Officer to re-open recruiting, and now invites applications from motor cyclists of good physique. The particulars are as under : Age, 19 to 38. Sidecar experience desirable, though not compulsory. Pay, 1s. 2½d. per day all found. Mr. Smith, who is inspecting officer in the South Midland Divisional Area, will attend at the Recruiting Office, Masonic Hall, Coventry, every Wednesday afternoon until further notice for the purpose of examining candidates, all accepted proceeding forthwith to the training centre.

Readers living at a distance should first obtain a Medical History Sheet from their nearest Recruiting Office, and post it to the Editor, when, if satisfactory, a free railway warrant will be issued to attend the next inspection.

A limited number of expert cyclists, well developed men, with a slight knowledge of motor cycles, will be accepted for the Motor Machine Gun Service. At our suggestion, batches of friends may enlist together, and will as far as possible be allotted to the same battery. Should any man on the waiting list not have heard from Mr. Geoffrey Smith, he should at once apply again.

A.S.C. Mechanics and Car Drivers.

There are still a few openings for qualified mechanics with motor cycle workshop experience. Candidates must be able to perform any repair or adjustment to an engine, gear box, or other part. Applications, stating briefly age and experience, should be accompanied by two testimonials.

There are also a few openings for car drivers with at least three years' driving experience.

The pay for mechanics and car drivers is 6s. per day, the usual separation allowance.

Royal Flying Corps.

A paragraph in the last issue appealing for motor cyclists for the R.F.C. brought a large batch of letters—so many, indeed, that recruiting for this branch of the Service was soon closed.

Royal Engineers.

The waiting list of despatch riders in this section is now a fairly lengthy one, it being some time since the R.E. called up men.

Volunteers and the Birmingham Charity Sports.

THE Midland Motor Cycle Volunteer Corps sent a troop to give three displays at the Charity Sports held at Birmingham on Saturday. The weather, fortunately, kept fine.

The troop's first item was a course of formation drill on machines, demonstrating that men can move at speed in formations suitable to the ground over which they are travelling. The men wheeled well in line, the dressing was kept, and all the movements accurately carried out. Favourable comments were passed by the military. The drill used by the corps is the same as laid down for cavalry.

Event No. 2.—Placed at intervals in the field were three posts; on two were heads, on the third a ring. The men had to cut off the first two heads and point the ring off the third post with a cavalry sword. The cuts and points were those used by the cavalry in the pursuing practice.

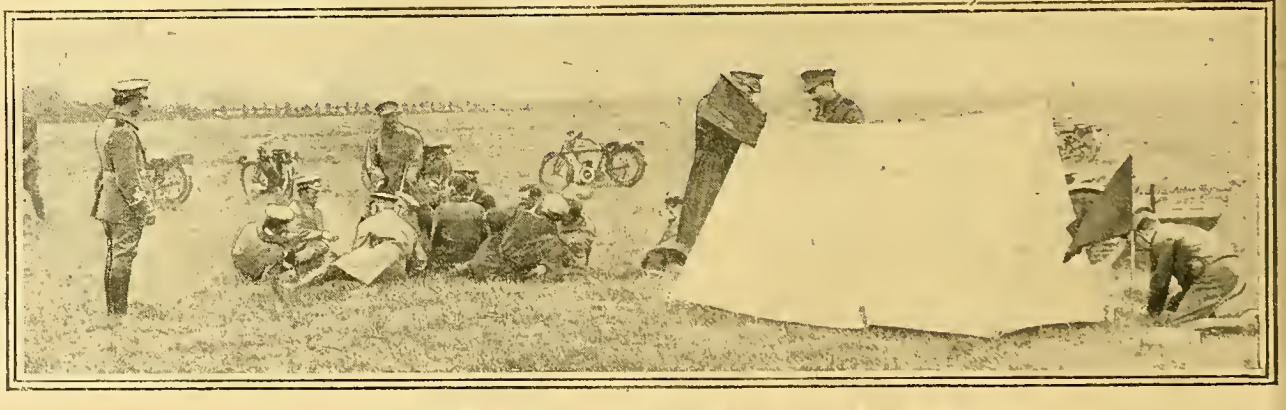
The third event was practically the corps weekly work—attack and defence. The patrols of the corps came in and searched for a suitable camping ground. This found, tents were pitched, camp fires lighted, and vedettes posted. The men are seated round the camp fire singing when the Commandant calls for despatch riders. The men come up smartly and receive despatches. These they promptly conceal, and depart on their journey. Suddenly they are attacked, two fall wounded, one of the others returns to camp and gives the alarm, the other stands by the wounded and defends them with his revolver.

The alarm is sounded; two men go out and pick up the men and bring them in under protection of a patrol, who beat off the enemy.

Again the camp is attacked, this time in force. The tents and fires are knocked over, the alarm given, and the men are seen advancing to attack. The enemy are driven off; first aid is given on the field by the corps ambulance.

The men returned to the paddock, and the final of a cycle race was in progress when four of the riders collided and some of the men hurt. The corps sidecar ambulance instantly proceeded across the field, this time to render services urgently required.

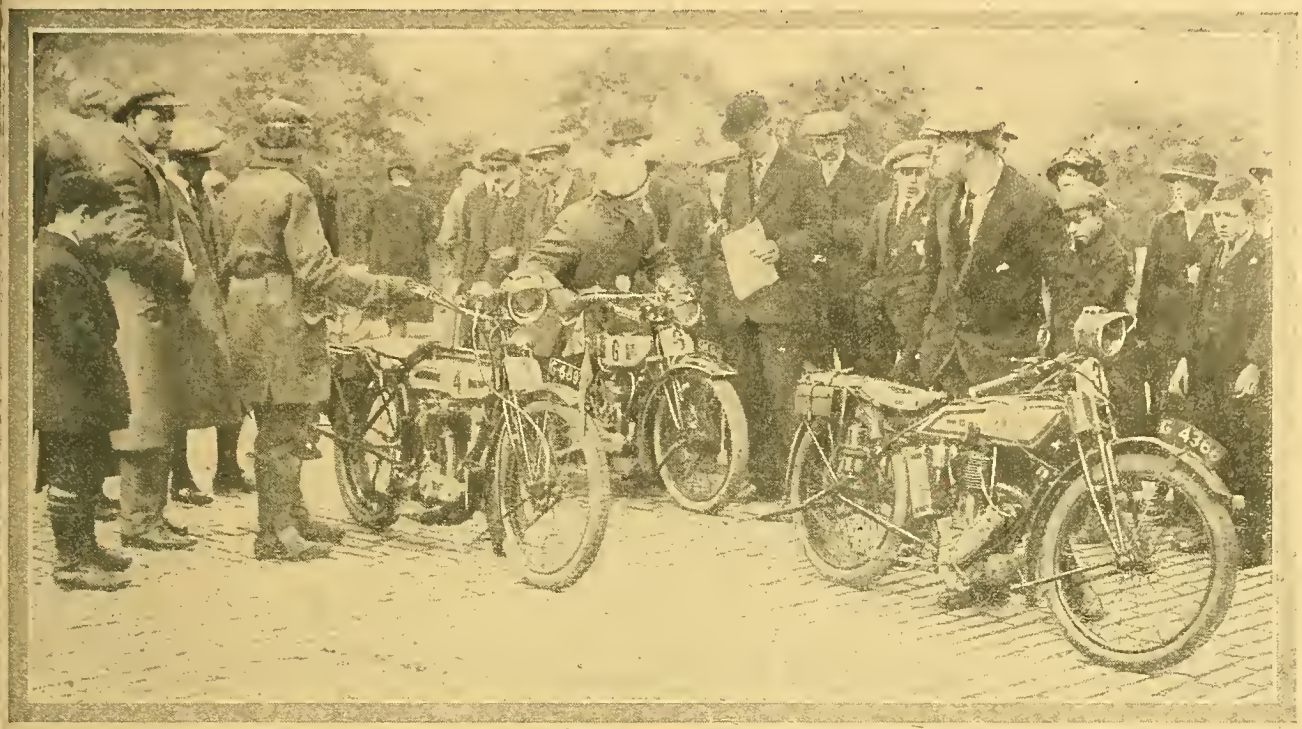
The worst case was taken up, first aid given, placed on the stretcher and sidecar and brought in.



Members of the Midland M.C.V Corps on the Castle Bromwich flying ground.

Twenty-one Starters in Glasgow Open Trial.

Nine Riders Qualify for Gold Medals after Twelve Hours' Run.



Scene at the start of the Glasgow M.C.C. twelve hours open trial on Saturday last. There were twenty-one starters.

ON account of the unrest and uncertainty created by the present abnormal circumstances, the fate of the Glasgow M.C.C. open twelve hours' trial hung in the balance for some time, and even when the entry forms were issued it was far from certain that the event would be held. Intending entrants were requested to return the forms fully a week before the date fixed for the trial itself, so that the committee might have time, if sufficient entrants offered, to make the necessary arrangements.

The riders were sent off in pairs at one-minute intervals from 8 a.m., the route being by Duntocher, Loch Lomondside, Arrochar, Rest and Be Thankful, Hell's Glen, St. Catherine's, Strachur, Whistlefield, Ardentinny, and Blairmore to Dunoon, where there was a stoppage of an hour and a half for lunch. The distance outwards was eighty-eight miles, while on the return, by varying the route to include Ballachandrain Hill, ninety-eight and a quarter miles were covered. Favourable weather prevailed, and the roads were, generally speaking, in good order, though loose in places. Several of the competitors experienced mechanical troubles, one finishing the course with both brakes out of commission—something in the nature of an accomplishment on such a trying journey. H. W. Ballardie was unfortunate enough to fall while taking a bend in the road on Lochfyneside, breaking his leg. Douglas Alexander sportingly abandoned his chance of an award to take Ballardie along in his sidecar until a motor car could be requisitioned to convey him home to Glasgow.

Four observed hills were included in the course, two on the outward journey and two on the return. Successful ascents of all four, together with the completion of the course within the scheduled time, earned a gold medal, while silver medals were offered to those who completed the course within the specified time and had three clean ascents. Subject to this qualification, the following nine riders, none of whom made an error of more than one minute in arrival time, are eligible for gold medals :

	Due. h. m.	Arrived. h. m.
T. A. M'Creadie (3½ Sunbeam) ..	6 57	6 57
W. G. B. Scott (4½ Excelsior) ..	6 58	6 58
E. Marzella (3½ B.S.A.)	6 58	6 58
T. Tennent (3½ Rudge-Multi) ..	6 59	7 0
A. J. C. Lindsay (3½ Rover) ..	7 0	7 0½
R. Holmes (5-6 Clyno sc.)	7 0	7 1
D. B. Stirling (5-6 Clyno sc.) ..	7 2	7 2
D. M. Brash (7 Harley-Davidson sc.)	7 2	7 2½
J. R. Alexander, jun. (7 Indian sc.)	7 4	7 4½

Final touches before the test. Snapped at the start of the Glasgow M.C.C. trial.

AN IRISH HILL-CLIMB.

ON Saturday, the 3rd inst., the Ulster Centre of the Motor Cycle Union of Ireland, held an open hill-climb at Red Brae, Carrickfergus, near Belfast. The weather was very unfavourable, but as the hill is almost perfectly straight, and eleven of the competitors having come to the start, it was thought advisable in the circumstances to go on with the principal event. Only one of the men entered for the novice class turned up, and this event was cancelled. There were twenty-one entrants in the open event.

This was the first hill-climb held on this hill, and it is by far the best venue for such an event that has been found in the North of Ireland; the surface is good, the gradient a thoroughly stiff test, and no corner to give the slightest trouble. The result was as follows :

	H'cap.	m. s.
1. E. Thompson (Rudge)	7 ..	1 26⅖
2. J. Ewart (Rudge)	7 ..	1 26⅗
3. J. W. Shaw (Norton)	3 ..	1 28
4. S. Corry (Norton)	scr. ..	1 33

Shaw made fastest time of the day, doing 1m. 31s. for the full distance.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Clubs and the War Loan.

Sir,—The Cyclecar Club has decided to place as much as possible of its available funds in the War Loan, and would suggest that if all other motor clubs did the same a very large amount would be subscribed thereby.

A. C. ARMSTRONG, Honorary Secretary.

[We are glad to see that the Cyclecar Club has adopted the suggestion in our last issue. The A.C.U. has invested £1,000 in the fund.—ED.]

Lady Motor Cyclists.

Sir,—The picture in *The Motor Cycle* of June 24th of the lady driver of the Regal sidecar outfit takes my fancy. Surely I dare do what other ladies dare. Up to last year I was always a passenger in a sidecar attached to a Rudge-Multi, driven by my husband, and I enjoyed it very much. My husband's death has left me very lonely, and I am seriously thinking of buying a motor cycle, but am frightened of breakdowns on the road. I should be glad if some lady driver would give me her experience of road troubles. Also, I should like to know which is the easier for a learner to drive, solo or combination. S.E.M.

A Good Samaritan.

Sir,—I think perhaps it may interest your readers to know that every policeman is not "dead nuts" on the motorist. I was returning from Arnside to Lytham on the night of June 30th when I was stopped at Preston owing to my rear light having failed in some unaccountable way. I tried all the ways I could think of to get it to work, but it was no good. It had evidently made up its mind to strike—and strike it did. The result was I found myself without a rear light fifteen miles from home, and four miles of a busy town between me and the nearest garage then open. I had just made up my mind to walk to that garage when a policeman rode up on a bicycle. Seeing me stopped there and enquiring the reason he, without hesitation, took off his rear red light and fixed it on my machine, telling me to send it back the following day. I thanked him, and set off home rejoicing. He was indeed a good Samaritan. GRATEFUL.

British Firms and Advertising.

Sir,—I wonder if English manufacturers have lost faith in advertising, or do they still think that because a thing is English-make that is sufficient to convince anybody that it is the best?

Since March 1st I have noticed various advertisements in your paper. The one I am most interested in is concerning speedometers. I venture to say that not more than twice during the last three months has an English-made speedometer been advertised. I begin to wonder if speedometers are manufactured in Britain. The two makes advertised, viz., the Jones and Stewart, are both of American manufacture, and very good; but, as a Colonial, I have a leaning towards British goods.

However, if the Britisher does not see fit to push his wares he will be the one to suffer, and all credit will be due to other competitors if they have the market.

Ottawa, Canada. COLONIAL.

A Motor Cyclist's Duties.

Sir,—Knowing how much you have at heart the interests of motor cyclists, I venture to think you will find room for this short letter in your paper.

My son, who is a despatch rider attached to a Signal Company along with fifteen other motor cyclists, has just informed me that as their division is moving to a country which is unsuitable for the use of motor cycles they are to ride push cycles. They have, of course, been specially trained as motor cyclists, and on the eve of departure to compel them to ride push cycles seems most unjust.

My son enlisted under the distinct impression that a motor cyclist enlistment was a special one, and that he could only be used as a motor cyclist, but apparently this is not so. JOHN HIBBERD.

Motor Cycling and Rifle Shooting.

Sir,—The following may be an item of interest to readers:

On June 24th I rode from Thetford to Richmond (Surrey)—100 miles—on a motor cycle to compete in the S.U.R.C. rifle meeting at Ham and Petersham ranges. I did the ride before breakfast, and was shooting by 10.30. The first target I shot was at twenty-five yards, and was a good highest possible score—100. Later in the day I won the Bell Trophy and gold medal with a score of 295. I also took a good position in the *Telegraph* and *Express* competitions, and shot for England in the International match, which we won against teams from Scotland, Ireland, and Wales. I took prizes in two unlimited competitions as well.

Considering that I am past middle age, I think this proves that motor cycling is rather more a nerve stayer than a nerve shatterer, as many suppose. I have done similarly at other local meetings; but the above is far more convincing, as the competitors were more numerous, and open to all.

My machine is a local make, Chater-Lea fittings, 5-6 h.p. Peugeot engine, and has 50,000 miles to its credit, and is even now the most reliable machine I know: in fact, it could not be more so. J. G. BROWN.

J. G. Brown, crack rifle shot and keen motor cyclist, a letter from whom appears on this page.

Overheard At the Front

Stories of the War in Comedy and in Deadly Earnest.

By Chas. G. Harper.

¶ Among the many books that have been written on the war this collection of stories, reprinted from "The Autocar," stands out by reason of the originality, force and humour displayed.

¶ The stories deal with the sayings and doings of the men at the front, and are largely in dialogue. That they are true to life is vouched for by soldiers themselves (see appended letters).

PRICE 1/- net. By post 1/3.

Obtainable from leading booksellers and bookstalls, or direct from the Publishers:
ILIFFE & SONS LIMITED, 20, TUDOR STREET, LONDON, E.C.

SPECIMEN ILLUSTRATION.

OPINIONS from the FRONT

"The book ('Overheard at the Front') is very interesting and perfectly true to life; since the fellows have heard I have got it they all want to borrow it."

Corporal W. Jane, 5th Battery R.F.A., British Expeditionary Force.

"I duly received book 'Overheard at the Front,' which is a splendid collection of short tales, and I may say that I can never find the book again if I lay it down, for it is immediately snatched by one of the other fellows who is soon deeply engrossed in one of the tales and quite oblivious to his surroundings."

Sergt. E. Schofield, 2nd London Div. T.F., British Expeditionary Force.

Tyre Covers.

Sir,—With reference to Mr. Quintin Miller's letter on "Tyre Covers," pure Para with the necessary ingredients for vulcanising is, when vulcanised, a mottled grey colour, and will after a short period gradually turn a whitish grey; this is due to the sulphur blooming up. If the piece of rubber is cut through the centre in this state, immediately you get under the surface, the rubber will be the same colour as when first vulcanised. The method usually adopted with the best grades of rubber, after vulcanising, is to desulphurise them. This usually gives the rubber a blackish appearance, and the colour will be practically permanent. The soft red rubber Mr. Quintin Miller speaks of would not do in the making of tyres, and more so with a good thick tread, as this would cause rolling, which was felt in the early days of motor cycling with some makes of tyres; also the tyre would be full of cuts after the first run. The more compressed the tread is, the better the wear.

The Bates tyre is of a dark grey colour when cut through, and will give a mileage (without guarantee from the maker of the tyre) of 3,000 on back and 5,000 on front; at least this is what it will do on my machine with sidecar (Triumph 4 h.p.) I have a Bates tyre on the front wheel that has done upwards of 6,000 miles, including over 3,000 on the back wheel. G. E. SCATTERGOOD.

The Boycotting of German Motor Cycles.

Sir,—The correspondence which has appeared in your columns under this heading seems to be directed to the end of hitting the Germans after the war is over. I think that most of us may more profitably devote our energies to hitting the enemy now. That should be our present, truly noble aim. Gentlemen who discuss what they are going to do after the declaration of peace presuppose a knowledge (1) of what the terms of peace will be, (2) of which side will win, (3) that some of us will still be alive. Respecting (2) and (3), we all hope for and, I think, believe in a good result, but you remember "the man who once did sell the lion's skin while the beast lived was killed in hunting him." As regards (1). I wish to say that, not knowing the terms of peace, I cannot decide what I should do under circumstances which are hypothetical. But this, as a general principle, does seem clear—that, if the beast's teeth and claws can be drawn and he be rendered tame and harmless, it would be entirely un-British for us, after the change, to go on hitting him.

Perhaps I shall offend the sense of the ideal in your correspondents if I refer to the economic side of the matter. Such action as they advocate would not only result in no German machines being sold to us; it would also penalise British manufacturers by preventing them from exporting their machines to Germany. Because, if we do not buy we cannot sell. If we are to find a market in Germany for woollen goods or cotton, or anything else you like to name, why should not Germany give us motor cycles in exchange if she can make them good enough and cheap enough to be worth having? Someone may suggest that Germany should pay in butter and eggs and sausages. But why should I be obliged to buy German butter and eggs, let alone sausages, so that you may wave a flag and swank about with an all-British bicycle? And why not carry out the proposal logically and advocate that, not only we, but our Allies and all properly disposed neutrals should boycott *all* German goods? Why stick at motor cycles? You mean, of course, that, after beating the German and knocking him down so that he can never get up again, and making peace-after-Armageddon, you are going to re-open hostilities on the part of most of the world with the object of starving such Germans as are left. Surely it would be less trouble to shoot them all! I am sure it would be cheaper and safer for our children and grandchildren.

But are we not in danger of losing the fine purpose and high aim with which we began to fight? Do we not, in advocating reprisals, import a German product far more deadly than gas or N.S.U. machines? I do not know to what extent the blame for this war is shared by the German people with their rulers. Nor do I think that we should concern ourselves with the question of punishment, but with making a repetition of the evil impossible—and that will not be done by reprisals. But of this I am convinced, that Germany has stepped backwards towards nationalism, and our aim should be altogether to avoid imitating her and ever to insist on pressing forward towards the closer union and fuller understanding of all nations. The progress of this ideal seemed at first to have been rudely disturbed by heathen pan-Germanism. But already we find ourselves more in sympathy with Russia and India. If not we, at least our children may learn to find in a humbled, chastened Germany a sane people with whom they may be friends. I, for one, have no wish to sow dragon's teeth for the next generation.

May I suggest that motorists may show true patriotism by economising in petrol? At a time when we are endeavouring to concentrate all our efforts to supplying our forces, people, and Allies with food, clothing, and munitions of war, there is no justification for using some of our products to pay to import petrol except for necessary use. What is necessary each man must decide for himself.

HUGH LEADER.

New Zealand Experiences

Sir,—A writer from Taranaki in a recent issue asks, "Why have 6-7 h.p. machines?" He seems to have derived satisfaction from a 2¾ h.p. lightweight, and appears to think that high-powered machines are put on the market to benefit the oil vendors. My experience has been that the high-powered machine is by far the safer proposition, even though fuel consumption is slightly greater, for the engine need never be run "right out," so engine wear should not manifest itself to the same degree as in a lightweight machine when good roads tempt one to "put on the juice."

I hardly think that 2s. 2d. is an average price for benzine. The highest price I have paid is 15s. 10d. per case of eight gallons, and that has included the extra war risk. A refill at a garage, however, costs 2s. 6d.

Toll-gates are undoubtedly antiquated ideas of securing revenue, but they have been forced upon local bodies by the tremendous growth of motor traffic, which has destroyed the roads faster than the authorities have been prepared for, so under the circumstances they regard the toll as a justifiable levy on the motorist. And we motorists do not mind when the local bodies give us improved roads with our money. There is one county in Taranaki (which is, by the way, the butter and cheese province of New Zealand, and provided the prizewinners at your last Dairy Show at Islington) where the council has provided several miles of tarred macadam road, and I am sure the 6d. or 9d. is not begrudged by the motor cyclist for his ride over these particular roads. Most of the roads in this fertile province are good, but it is of little use providing a machine built for good roads alone, for there are many places where one may desire to go where a lightweight would be out of place.

I rode a lightweight for some time, and its limitations were frequently impressed upon me. I have a highly satisfactory mount now—an 8 h.p. Sparkbrook and sidecar. Should I want a more up-to-date model machine in a few years' time, I think I will still be on the look-out for the latest Sparkbrook. The chain-cum-belt system has proved wonderfully effective. My machine has done somewhere in the region of 6,000 or 7,000 miles, and the only trouble I have had on the road with the transmission was a broken connecting link, and that was because of undue strain.

Regarding prices of machines, there is no doubt need for reform, and, so long as a machine passes from manufacturer to distributer, to wholesaler, to provincial agent, to local agent, the price must remain high, for each handling adds to the retail price. If the manufacturer could reach the prospective rider in a less roundabout way, the price need be little more than the retail price in England, for trade discounts surely amount to as much as does freightage, etc. Why is the British manufacturer so self-satisfied, so content to allow his goods to speak for themselves? The Americans like this attitude, I daresay, for one particular firm from the land of Stars and Stripes is able to put its machines on the market here at from 10% to 15% less than the Britishers, merely by the cutting down of some of the middlemen But we want British goods. We are Britishers through and through in New Zealand, and are prepared to make sacrifices for our homeland; but we would appreciate British manufacturers endeavouring to get in closer touch with us. That 10% or 15% saved on the British machine would probably mean a greater number of motor cyclists in New Zealand, large though the number is at present. GEORGE LIST.

New Plymouth, Taranaki, New Zealand.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Lubrication.

I would like your advice in regard to the satisfactory regulating of a Best and Lloyd drip feed, *i.e.*, number of drops per minute for average touring.—F.W.C.

About thirty drops per minute is usual up to twenty miles an hour. The drops should be increased according to speed, and if you are travelling all out for any distance, you may even let the oil run in a continuous thin stream.

Easy Starting.

I have bought a 2¾ h.p. motor cycle fitted with a Dixie magneto, two-speed gear, and free engine. I have passed middle age, and health will not permit too much exertion? Will you inform me how the starting of such a motor cycle can be improved? The machine is quite a normal starter.—J.F.

If you insert the low gear and give a vigorous push the machine should fire almost instantly, and with a minimum amount of exertion. It is of course understood that the carburetter is properly adjusted, and that you flood it well before attempting to start.

A Model Petrol Engine.

Would you kindly tell me if phosphor-bronze could be used for the cylinder of a small model petrol engine? It would be water-cooled. If not, what are its chief disadvantages?—E.C.F.

Phosphor-bronze is probably perfectly satisfactory for a model. The objections to its use in large engines are the cost and the inferior wearing qualities by comparison with cast iron. Cast iron is most generally used as it has a special faculty for acquiring a glass-like surface under friction.

Risks on the Highway.

Would you kindly advise me on the following: I was motor cycling near Grimsby on a main road the other evening when I ran into some stray cows on the road, which threw me off and damaged my machine. Another motorist had done the same thing three minutes previously. Can we get damages from the farmer?—L.K.

It is practically impossible to obtain damages in such a case, although the police might get the farmer fined for allowing his cattle to stray. This is curious but it is the law.

Slow Running.

I have a new 4-5 h.p. Zenith. After trying several jets I find I can do 78 m.p.g. with a 32 jet. Is this the usual consumption? If not, how can I improve it, as I have tried to alter the level, but with no success? I cannot run in medium gear at less than about ten miles per hour without misfiring. There is no leakage, as I use insulating tape. Is it correct to give half a pumpful of oil every three miles?—E.B.

We think that the consumption is very reasonable. We should not recommend you to try and improve it, otherwise you will interfere with the power of the machine. The cause of absence of slow running is the fact that the carburetter is not an automatic, or even a semi-automatic one. It is not difficult to get slow running and good consumption. Slow running depends upon using an enriched mixture and little of it. The lubrication is about right, but slightly extravagant.

Advice to a Novice.

Would you be so kind as to help me to select a motor cycle and sidecar combination? I am a novice about to take up motor cycling, so, of course, do not want a complicated machine. I would rather pay the price to get a sound and reliable machine. (1.) What power machine would you suggest? (2.) Would you recommend single or twin-cylinder? (3.) What is the best book I can get to enlighten me on the working of a motor cycle engine? (4.) What machine or machines would you suggest? (5.) Do you advise me to buy a new or second-hand machine?—A.H.C.

(1.) We should advise not less than a 3½ h.p. single or 5-6 h.p. twin. (2.) This is a matter for your own individual taste. A twin is more flexible and more pleasant to use. (3.) We recommend the following books: "Motor Cycles and How to Manage Them," "Motor Cycle Hints and Tips," and "Tracing Troubles," all of which can be obtained from these offices, price 1s. 2d. each, post free. (4.) We regret we cannot recommend any particular make of machine. If you care to ask our advice about any *one* which you think will suit you we shall be glad to let you know if this will be the case. (5.) It will be better to buy a new machine, as good second-hand machines are now very difficult to obtain.

A Misty Drip-feed.

(1.) I have a Royal Enfield countershaft two-speed gear. What oil should you recommend for the chains? (2.) When on the road the glass of my drip-feed, normally ordinary glass colour, assumes a copperish colour. Is this a sign of over-lubrication? The oil leaks terribly from the valve tappets.—S.H.W.

A graphite grease should occasionally be put on the chains, and a little engine oil should be applied to the expanding clutches of the gear. (2.) If your drip-feed is misty it is not necessarily a sign of excessive lubrication. The glass should be detached and cleaned occasionally. The fact that oil leaks from the valve tappets seems to indicate that you are giving the engine plenty, and you might possibly reduce the supply a little. This might also be due to the fact that the tappet guides are worn.

Clutch will not Free.

I am the possessor of a 1914 2¾ h.p. motor cycle on which I have had conflicting advice from makers and agents which I should be glad if you would settle. When the machine is on the stand and the engine running I find the back wheel still revolves when the clutch lever is lifted, or if the back wheel is revolved by hand with the clutch out it moves very sluggishly and is not at all free. I wrote to the makers, who replied: "We cannot understand the wheel revolving on the stand with the clutch lever lifted. The possible cause is tightness of chain or want of lubrication in the gear box." The agent writes: "The back wheel will naturally revolve with the clutch lifted, or move sluggishly on account of the spring being more or less always in tension." Will you please say which is right, as I believe some wheels are perfectly free with the clutch lifted for running down hills? This machine has not done 500 miles, and is quite in order as regards chains and lubrication.—W.W.C.

Probably you are using rather too thick an oil in your clutch, or else the clutch is not withdrawn sufficiently. There is a certain amount of friction in many clutches when out of engagement, due to a variety of causes. Of the two causes suggested in your letter we should say that made by the makers is the more likely to be correct.

A Trailer for Passenger Carrying.

[?] I have just purchased a second-hand 2½ h.p. Motosacoche, and I have been wondering whether, as I have never ridden a motor bicycle before, a bicycle trailer could be safely run behind it. What I would like to know is—(1.) Can a trailer be safely run behind a 2½ h.p. motor cycle? (2.) What, if any, are the objections to it, in a flat county such as Cambridgeshire? (3.) Is there any more duty to pay than on a motor cycle or combination?—C.S.G.

(1 and 2.) The machine is not sufficiently powerful for taking a trailer. Moreover, a trailer is not a particularly safe or comfortable means of taking a passenger; also the rider gets the benefit of your dust and the smell from your engine. (3.) The local taxation licence for a trailer is £1 in excess of the motor cycle licence, while a sidecar costs nothing extra. It is better to use the machine as a solo mount first, and when you have acquired sufficient confidence, purchase a more powerful machine, to which a sidecar may be attached when desired.

Barrow-in-Furness to London.

[?] I intend riding up to London from Barrow-in-Furness, and I believe that it is better to go *via* the Great North Road in order to avoid as many towns as possible. Can you tell me the best way to join this road from Penrith (Cumberland), and also the best way of getting to Hampton Court when near London—avoiding the city—breaking off, say, somewhere about Hatfield?—W.F.H.

Your best route would be as follows: Barrow, Ulverston, Kendal, Kirkby Lonsdale, Ingleton, Settle, Skipton, Ilkley, Otley, Harewood. About two miles south of Wetherby turn right and go through Aberford, Ferrybridge, Doncaster, Retford, Newark, Grantham, Stamford, Stilton, Eaton Socon, Biggleswade, Baldock, Stevenage, Welwyn, Hatfield, to Barnet. If you are going from Penrith, make your way from Penrith to Kendal, and then by the route we have given. As regards getting to Hampton Court, your best plan is to branch off at Barnet, and follow the road marked in blue on the R.A.C. Official Map of Recommended Routes Round London (obtainable from *The Motor Cycle* offices price 1s. 3d. post free). Turning right at Barnet, this avoiding route passes through Elstree, Little Bushey, Harrow Weald, Wealdstone, Greenford Green, Heston, Hounslow, Fulwell Park, turning right near Strawberry Hill, and following tramlines to Hampton Court.

A Powerful Solo Mount.

[?] (1.) Would an 8 h.p. spring frame machine (chain driven), fitted with T.T. handle-bars, be suitable for solo work? (2.) Would there be a great deal of vibration? (3.) How long would it take a novice to learn to manage such a machine?—X.Y.Z.

(1.) The machine would be rather heavy for solo work, but some riders are fond of a powerful machine. (2.) There should be very little vibration. (3.) The machine is not suitable for a novice. However, an intelligent rider would not take long to learn to manage one of these machines. You could learn to ride almost at once, and at the end of a few weeks you would have begun to know the machine.

READERS' REPLIES.

The Red Flag.

The following additional information may interest "F.B.R. and others. The legal obligation for a man to carry a red flag in front of the mechanically-propelled vehicles on common roads was enforced by the Locomotives Act, 1865, 28 and 29 Vict., C. 83, S. 3, p. 2, for the whole of the United Kingdom of Great Britain and Ireland, but as regards England was repealed by the Highways and Locomotives (Amendment) Act, 1878, 41 and 42 Vict., C. 77, S. 29, and as regards Scotland by the Locomotives Amendment (Scotland) Act, 1878, 41 and 42 Vict., C. 58, S. 4. Nevertheless, the practice of carrying a red flag was voluntarily continued in many cases long after it had ceased to be obligatory, and this no doubt led to the general belief that it was done in consequence of legal requirement. It was heavy taxation (£10 per county authority per annum), ridiculous speed limits (two and four miles per hour in town and country respectively), restrictive and varying local byelaws with road and bridge prohibitions and limitations, and the obligation to have three persons in charge which hampered light mechanical road traction prior to 1896, but *not* the red flag so far as England and Scotland were concerned.—S. R. SHEPPARD.

Retreading.

"H.L." may be interested in the following experience of retreading: I had a Hutchinson, 26×2¼in., retreaded last July (1914) by the Beldam Co. I fitted it on the driving wheel of my 3½ h.p. Singer with sidecar. The machine was used constantly from then up to April this year with the retread still on that wheel, when the tyre was discarded owing to the bead giving out from rust and wear and tear. The roads here (Co. Limerick) are never steam rolled—just pot-holes and loose stones, mud and (in dry weather) dust. I have had the tyre pulled off with skidding on loose metal, but never once suffered from the puncture fiend. The retread is not half worn, but only discarded on account of the bead. I believe that any tyre with sound beading will make a satisfactory retreading job. Such is my own experience on excessively bad roads, winter and summer. The charge for retreading was 13s. 6d. Usual disclaimer.—A. MCBRATNEY.

[We think it only fair to state that we have received other letters which speak well of retreads by the company named.—ED.]

SCENE IN MILAN.

An Italian lady selling a Red Cross souvenir to a military rider of a Triumph.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"F.B." (Berkhamsted) and "W.M.B." (Yorks.).—Grado multi-pulley for sidecar work.

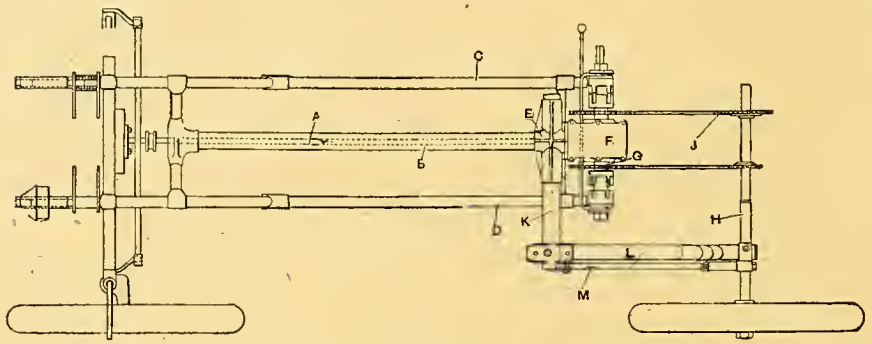
"A.G.F." (Perth).—Binks carburetter fitted to 1914 6 h.p. twin J.A.P. engine for sidecar work.

"E.L.F." (Hampstead).—Wooler two-stroke. Reliability, durability, consumption, and hill-climbing.

"W.F." (Worcester).—Suitable two-stroke for sidecar work on country roads; also 2½ h.p. or 5 h.p. F.N. Ease of handling, general reliability, and cost of upkeep.

A Morgan Four-wheeler.

It will be seen that the illustration is a partial plan view of a four-wheeled chassis. The forward part of the chassis is on the same lines as the well-known three-wheeler, the engine being mounted at the front, and the drive being taken by a shaft A passing through a tube B built into the frame. At the rear the main frame tubes C D are connected by a casting E, with which is formed ntegral a gear box F driving the countershaft G, from which the drive is taken to the back axle H by either of two chains J, giving different gear ratios. The casting E is extended on either side, as shown at K, to form the



platforms on which the springs L are mounted, and radius rods M may also be supported by the extensions, the radius rods being adjustable for the purpose of effecting adjustment of the driving

PATENTS

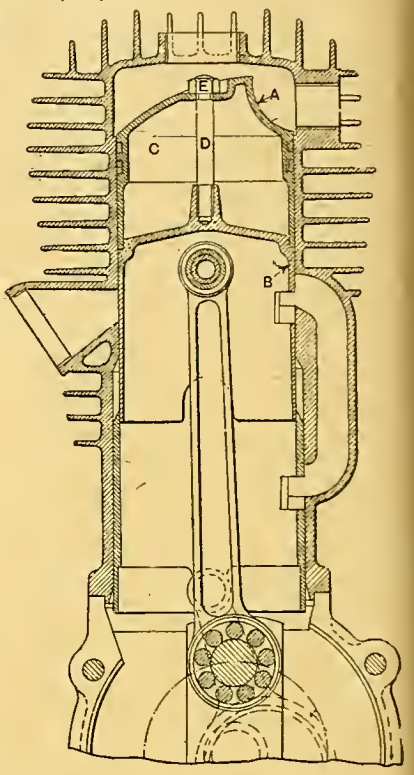
BY

ERIC W WALFORD.

chains.—H. F. S. Morgan, No. 19,467, 1914.

A Piston for Two-stroke Engines.

With the object of increasing the compression pressure in the crank chamber without a corresponding reduction of compression in the cylinder, the piston is made in two parts A and B, the upper part A effecting the cylinder compression and the lower part B performing the corresponding function in the crank case. Thus the space C enclosed by the piston parts is deducted from the crank case capacity, with a consequent increase of pressure. The parts A and B are secured together by a rod D and nut E.—The Enfield Cycle Co., Ltd., and F. W. Smith, No. 8,978, 1914.



Forward Plugs.

We are informed by the Forward Motor Co., Summer Row, Birmingham, that, owing to the heavy demand for Forward plugs and fasteners by the War Office, they have been compelled to discontinue the manufacture of Forward motor cycles.

Mr. George King and Hutchinson Tyres.

Rumours have been current lately to the effect that Mr. King has severed or is about to sever his connection with the Hutchinson Co. The origin of these rumours is unknown, but both the company and Mr. King desire emphatically to deny them.

The Low Accessories.

The business of the British Low Accessories Co., Ltd., has now been taken over by the Low Accessories and Ignition Co., Ltd., Morley House, 26 and 28, Holborn Viaduct, E.C. This company intends to deal with the Cup sparking plug, the Low Averometer, and several other novel and valuable accessories.

"Coolie" Motor Cycle Oil.

Many successes have lately been credited to Coolie oil, produced by the County Chemical Co., Bradford Street, Birmingham, notably on Magilligan Sands, Portmarnock, and during the Cork reliability trial on Whit-Monday. This oil is suitable for every class of machine, as evidenced by the fact that it was used by Ariel, Bradbury, Diamond, Douglas, Levis, New Hudson, Rover, and Sunbeam riders.

Pedley Belts.

Messrs. J. Pedley and Son, Ltd., Great Charles Street, Birmingham, have just received cable information that the Australian Grand Prix Race, run on the 28th ult., was won by James Millar on a Matchless motor cycle fitted with Pedley belt. This win is particularly gratifying, as this race has now been won two years in succession on Pedley belts. The Douglas team, which won the Melbourne-Sydney reliability trial, also all used Pedley belts.

Racing in New Zealand.

An important series of races was held on the New Brighton Beach track, New Zealand, recently. In the fifty miles handicap, Brown (4 h.p. Triumph) made the fastest time of the day, although pitted against riders of 7 h.p. twins. His time was 55m. 56s. On handicap, Brown was severely penalised, and finished third. The ten miles handicap was won by A. J. Barker (4 h.p. Triumph), fastest time again being made by G. B. Brown, in 10m. 29s.

Precision Engines in South Australia.

In the fifty miles road championship of South Australia, held on Saturday, April 3rd, the first prize was won by A. B. Carnell on a Lewis T.T. motor cycle equipped with 3¾ h.p. Precision engine, with overhead valves, in 1h. 7m. 21⅘s. The second man finished exactly 7m. later. Mr Carnell's record for the season is remarkable. It includes, in addition to the above-mentioned event, the Sellicks Hill-climb of the Motor Cycle Club of South Australia, in which he made fastest time and the best performance on formula; the petrol consumption test (246 miles to the gallon); and the half-mile speed event for machines under 560 c.c. In 1913-14 Mr. Carnell had also won the Sellicks Hill-climb and the petrol consumption test on a similar machine.

Reviews.

Rudge-Whitworth, Ltd., Coventry, send us a copy of a very attractive coloured showcard depicting scenes in connection with the 1914 Tourist Trophy Race, also a new edition of their 1915 motor cycle catalogue, and a copy of "Rudge Wrinkles."

We have received an interesting booklet entitled "The Largest Motor Cycle Business in the World" from the Hendee Manufacturing Co. The book gives a number of interesting illustrations concerning the manufacture of the Indian, and illustrations of the various British and American riders who have helped to make it famous.

THE MOST PERFECT

TOURING COMBINATION

IS UNDOUBTEDLY THE

1915 INDIAN

AND

SIDECAR.

Fast or slow at will—it annihilates distance and fairly streaks up hills if you are in a racing mood. Or, if by chance the maiden in the sidecar yearns for the solitude of leafy lanes, it will run so slowly and quietly that every loving whisper rises clear above the engine's note.

On the highways, in the bye lanes, midst the densest traffic, it responds to every silent call, and will run all day and every day without trouble.

It has stood the test of time, and each year increases in popularity.

SUCH IS THE INDIAN

GODFREY'S SUPPLY FOR CASH OR ON EASY TERMS, AND WILL TAKE YOUR OLD MOUNT IN PART EXCHANGE.

The DRUID "MARK II"

SPRING FORK

makes for the Rider's Perfect Comfort under EVERY condition of road surface—is wonderfully Efficient in use—is the ONLY Fork which embodies the CORRECT "Design-Principle"—is perfect in Spring-Action—makes for increased Speed—is exceedingly Strong, and—

acts Horizontally as well as Vertically

Now each of these features naturally saves wear and tear on other parts—eliminates risk of breakage or accident—

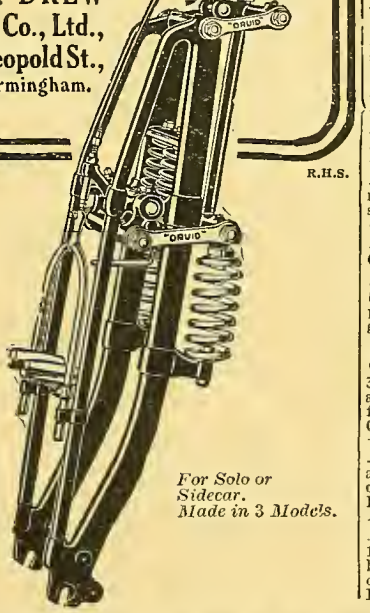
and lengthens the life of the Machine!

The experienced motor cyclist knows and appreciates all these facts and INSISTS upon the "DRUID" when buying his New Machine.

¶ If you would increase the efficiency of your present mount, equip it with the DRUID MARK II—the difference will surprise you!

Fuller details gladly on request.

A. DREW & Co., Ltd., Leopold St., Birmingham.



R.H.S.

The DRUID Mark II.

For Solo or Sidecar. Made in 3 Models.

The Business Man's Sidecarrier.

THE slow progress of the sidecarrier is somewhat difficult to explain, but the business man's tardiness in adopting it can only be put down to the British characteristic of fighting shy of anything unconventional. When, at the outbreak of war, hundreds of horses were commandeered for use in the Army, this journal was not slow to recognise the possibilities of the light motor cycle parcel carrier for tradesmen's use, and in several issues focussed attention upon the commercial sidecarrier as the lightest, cheapest-to-purchase, and cheapest-to-run motor transport in existence. It was further pointed out that the body could, if necessary, be made interchangeable, *i.e.*, as a business carrier during the week and transformed into a pleasure body for week-end trips with the owner's family, by the simple substitution of a pleasure type body. Our efforts were not unavailing, but, nevertheless, from enquiries which we have engineered since that time, it is evident that nothing like the amount of support has been received which one would have expected in view of the comparative dearth of horses. This comatose condition is not to be accounted for by the tightness of money, for, as a matter of fact, money flows freely enough in England, and the vast majority of tradesmen are continuing to make good profits.

Probably our Post Office authorities have been the slowest to adopt the sidecarrier for one of the most suitable purposes for which it is fitted, and that is for collecting rural district mails. For years the Post Office have been satisfied to negotiate through contractors to collect the country mails, and are, moreover, content to see ponies ambling long distances morning and evening with mails, which have necessarily had to be collected some hours previous to the time they would leave their nearest postal centre. With a reliable motor cycle and sidecarrier the expense would not have been increased—rather the reverse—whereas the service would have been considerably accelerated and brought up-to-date. Some time ago we brought these facts to the notice of the authorities concerned, and it is some small consolation to note that, with painful slowness, the sidecar is being adopted in the different rural districts, happily with great success.

Bad Roads: An Appeal.

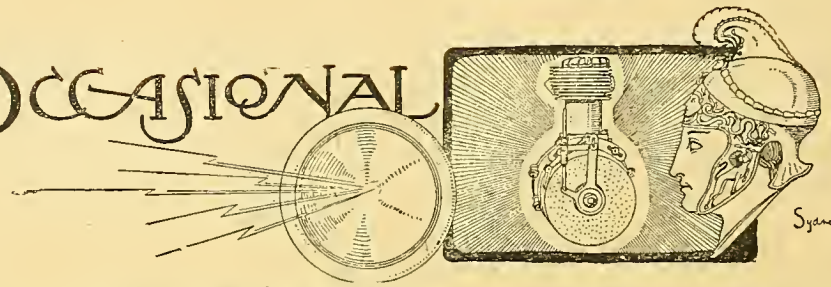
AS many of our readers are aware, numerous roads in this country have been severely damaged by motor transport waggons. There is little likelihood of any immediate improvement as regards road surface, though the authorities are in most cases gallantly struggling against tremendous odds to keep the roads in fair order. We know the position of certain of these roads, and we have been to some extent assisted by the A.A. map, which, however, is, we are sorry to say, incomplete and in some respects inaccurate. There is only one way of helping our readers, and that is for the many motor cyclists who are touring the country at the present time to communicate with us when they meet with any roads which have suffered severely from the extremely heavy traffic they have to withstand.

We know for a fact that certain roads in Hampshire, Wiltshire, and Oxfordshire have suffered severely, and we earnestly hope that those readers who are resident in these districts, or who have occasion to traverse them, will send us as complete and accurate reports as possible, so that we may eventually draw up a map by means of which we can assist those who are contemplating tours, or who have to make journeys on business.

The kind co-operation of our readers in this respect will help not only those who are engaged in war work, and who have a brief respite from their labours in which to take a health-giving trip into the country, but also the many despatch riders and others who are using their machines in the service of their country, and who wear the King's uniform.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS



By "IXION"

Amateur Shell Makers.

I am asked to announce that an association of amateur mechanics is being formed to machine shell cases in their spare time. Mr. Watkins-Pitchford, of Lamport, Northants, is the chief organiser, and the armament works are behind him to this extent that they are providing unlimited supplies of blanks to be machined up by amateurs on their own lathes. Some of the public school and technical institute workshops are responding very eagerly, and are sending in excellent work. There must be thousands of amateur motorists who possess medium-sized lathes, and have four or five evenings and an afternoon to spare each week. If they will communicate with Mr. Watkins-Pitchford, he will show them how to be of real service to the nation. It is on the cards that garage workshops may be employed on similar tasks in the evenings.

Petrol Consumption.

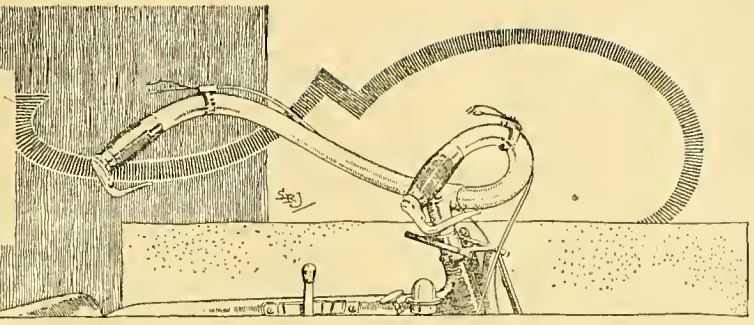
I have never sighed so deeply over the deficiencies in my technical education as during the last two years, when cycle car experience has shown me the ridiculous anomalies of petrol consumption. Last year, to quote a single example, I found myself in possession of a 2¾ h.p. twin motor bicycle, and a 10 h.p. four-cylinder cycle car. The former could cover no more than 60 m.p.g unless I adjusted the carburetter so as to tune down the engine power rather considerably; I could get up to 100 m.p.g. in a freak consumption trial at legal limit average, but for touring work 60 m.p.g. was the maximum I secured on a decent all-round adjustment, which provided easy starting, occasional speed bursts, and fast climbing. The cycle car, which weighed about 8 cwt. all on, was quite exceptionally economical, and compared very favourably with most of its rivals, but it averaged from 58-62 m.p.g. according to the roads on which it was used. In other words, the 160 lb. 2¾ h.p. motor bicycle, carrying one person, and the 8 cwt. 10 h.p. cycle car, carrying two persons, used approximately the same amount of fuel. I came to two conclusions on the matter; the one was that the motor bicycle, having a single jet vaporiser, wasted its fuel recklessly at low speeds; the other was that the cycle car wasted no fuel through "blowback." Liquid petrol was continuously sprayed out of the air intake of the bicycle carburetter, apparently when one of the inlet valves shut. When an inlet valve of the four-cylinder cycle car engine shut, a similar "blowback" doubtless occurred, but the rebounding gases were immediately caught in the suction of whichever inlet valve was then opening, and no rebound ever reached the main air intake, situated 3ft. or more from the valves, thus there was no wastage of fuel. By employing a three-jet Binks carburetter I reduced the fuel consumption of the bicycle to 85-90 m.p.g., but I could never approach the 120 m.p.g. which one would expect to obtain, and for this failure I blame the "blowback" more than anything else. When I have time I shall experiment with a very long inlet pipe, heated if necessary, in the effort to reduce the blowback on twins; but on single-cylinders the rebounds are so violent, and so unaffected by the next suction stroke, that there will always be a heavy wastage from this cause. Can any user of the automatic Claudel-Hobson carburetter tell us what consumptions he obtains with 2¾ h.p. twins and 3½ h.p. singles? I dislike using several very tiny jets on motor cycles, as they can hardly be efficiently screened from dust, and are apt to choke. The compensating effects of motor car carburetters, with their petrol reserves and so forth, are probably sound substitutes for the multiple jet.

At any rate, we are all dissatisfied with the petrol consumption of our bicycles when we see light car men and cycle car owners averaging from 40 to 60 m.p.g., and it is high time that some magnate of the carburetter world reassured us by demonstrating why our consumptions are so high, and what is being done to reduce them.

Spring Frames.

A very cute rider remarked to me the other day, "If our roads are overworked and under-repaired for another twelve months, a rigid frame motor cycle will be practically unsaleable." I do not notice that our manufacturers are evincing any notable interest in spring frames, and nobody could sympathise more than I do with the troubles which interrupted supplies of raw material and labour shortages are causing them. Yet, is the technical designer's time wholly absorbed throughout the year, and do the special problems of manufacturing in war time occasion any great increase of work for him? If not, the neglect of the spring frame is unpardonable. Even if our roads are put into decent order after the war, our manufacturers will have to compete with excellent spring frames of foreign construction. My experience is that when foreign manufacturers take up the springing question, they generally make a good job of it, perhaps because their roads (*e.g.*, American prairie tracks and Continental *pavé*) are so atrocious that first-rate springs are essential. In the light car world, the French Baby Peugeot and the American Trumbull are better sprung than 90% of the British chassis. It is high time that we gave up our muddling methods, faced existing problems, and set ourselves to solve them efficiently. There is no reason, except our innate *laissez faire*, why every standard British motor cycle should not be more comfortable than the average car; at present most of our machines are uncomfortable by comparison.

Experiences with a Scott Motor Cycle and Sidecar.



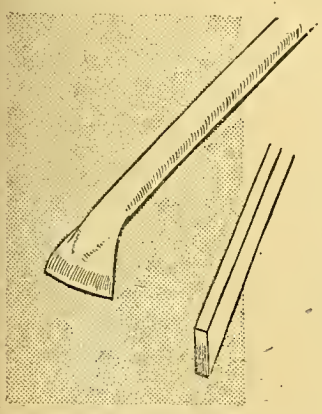
With some Hints and Tips on Care and Upkeep by a Member of our Staff.

ABOUT a year ago the writer invested in a Scott motor cycle, this machine being selected from other makes for certain peculiar features, namely, a two-cylinder two-stroke engine which can be driven hard without harm owing to the cylinders being water-cooled and the absence of valves and valve gear, an open frame of scientific design and construction, which, moreover, is eminently strong, and, finally, a speed gear and clutch operated by the foot, thus allowing full-arm control of the handle-bars at all times. The machine was altered from standard in certain respects, and includes "Tim Wood" racing handle-bars, Binks carburetter, semi-open exhaust outlet; a few small fitments were substituted for the original parts and fittings.

From the time at which the machine was purchased up to the present moment, the mileage has amounted to about 4,500, which cannot be called an immense total, but it is quite sufficient to enable anyone to judge how a machine will behave over three or four times that distance, and, incidentally, such mileage also enables one to learn how to treat a machine in the future from the amount of experience gained. So far the machine has given great satisfaction, but the knowledge required to keep an engine of the Scott type in perfect order is quite distinct from that gained by running an engine of the usual four-stroke variety.

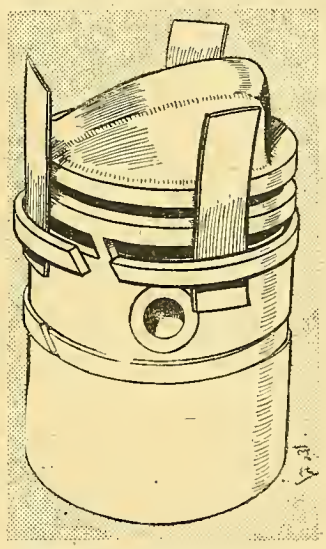
Tuning up.

The cardinal points in keeping a Scott engine in tune are clean transfer port gauzes, clean pistons, and consistent lubrication. In order to give the uninitiated reader a clear idea how to set to work we will presume he has just invested in a second-hand Scott machine which has been carelessly looked after by its previous owner and requires an overhaul preparatory to a lengthy season's work.



Two useful tools for scraping out carbon deposit.

In the first place, the engine had better be removed from the machine altogether, and this is a simple operation if the makers' instruction booklet is followed. The engine being on the bench, proceed to remove the exhaust and transfer port covers, and these, in addition to every other small fitting, should be stored in a box as they are taken off the engine to avoid the risk of loss. Now withdraw cylinder holding-down bolts by slackening off nuts under crank case lugs, and as the cylinders are being taken off, see that the pistons are in line with each other, otherwise binding may occur. After this operation, place the cylinders on the bench where they will not fall, and if the coslettised finish is still good, do not spoil it by placing the cylinders amongst a lot of odd tools and scrap. The removal of piston rings in the Scott engine should be carried out very carefully by the old process of three pieces of tin (as shown in the sketch), as in all probability the rings will be carbonised in their grooves and will have a tendency to snap in pieces if forced open. If the rings are troublesome squirt paraffin in and around the grooves *via* the slots, and gently urge them to move with the aid of a blunt-nosed darning needle. As each ring is removed (bottom one first and the others in order afterwards) hang it on a nail against the wall and place a pencil number beside it so that you will know the order in which they are to be put back on the pistons. The rest of the engine should now be put on one side and the cylinders dealt with next.



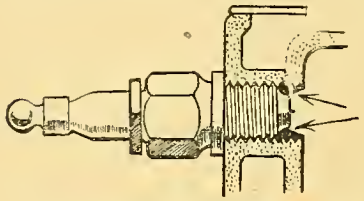
Removing piston ring with three slips of tin.

Removing Deposit.

The writer has found that two satisfactory tools for removal of carbon deposit in the cylinders can be made from steel rod, as shown in the first sketch. In most cases the deposit in Scott engines is soft and easy to scrape away, owing to the cylinders being

Experiences with a Scott Motor Cycle and Sidecar.—

water-cooled, but great care should be taken to clear out any carbon that tends to collect in the few threads that are exposed to the heat in the region of the sparking plug as seen in the accompanying diagram. This can be done with a sharp tang of a small file bent over in the form of a hook. It is advisable here for the novice to note that the cylinder heads on the Scott engine are cast in one with the cylinders themselves, and that the detachable rings on the outside of the cylinder heads are for access to the water spaces only. With the aid of a sharp penknife, scrape out all signs of deposit or caked oil which has formed in the exhaust and inlet ports and passages, and when both cylinders are completely dealt with wash out thoroughly with two or three pints of fresh paraffin and clean with a soft brush. After this has been done, the cylinders should be wiped perfectly clean with dry rags, so that not a particle of grit or chipped deposit remains.



The arrows show locality of deposit in sparking plug threads.

Pistons and Crank Case.

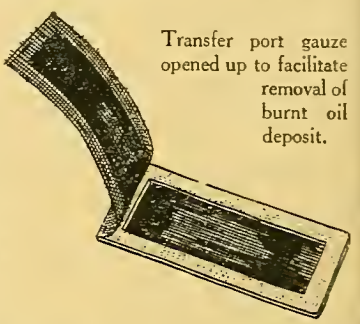
We now return to the pistons and crank chamber. After the rings have been removed, the piston heads and grooves can be scraped clean quite easily with a penknife, but in doing so a rag should be stuffed in the pit below the piston to prevent the chips of deposit from falling into the crank chamber. Having cleaned the pistons thoroughly, use the penknife also to scrape away all signs of packing that may exist on the surfaces of the crank chamber upon which the cylinders sit. After this has been accomplished, the crank chamber (minus inspection doors, clamp nuts and bars) with pistons, etc., should be immersed in a bath of fresh paraffin and thoroughly washed and scoured out with the aid of a stiff hair brush, particularly in the sumps and the region behind the flywheel and chain sprockets. One cannot be too particular in carrying out this job, as it is astonishing how much dirt and grit can be hidden away behind wearing surfaces and other important places. The crank case can now be stood on the bench on its base, so that the paraffin runs down into the sumps. By using a small oil pump, the sumps can be drained, the final extraction of grit being carried out with rag stuffings.

After these operations the cylinders, crank case, and internal parts should be perfectly clean, and if at this stage one happens to be leaving the job for any length of time, it is advisable to cover all parts with a sheet or two of newspaper to exclude dust.

The remaining cleaning operations concerning the engine relate to the transfer ports, gauzes, and exhaust port covers.

Transfer Ports.

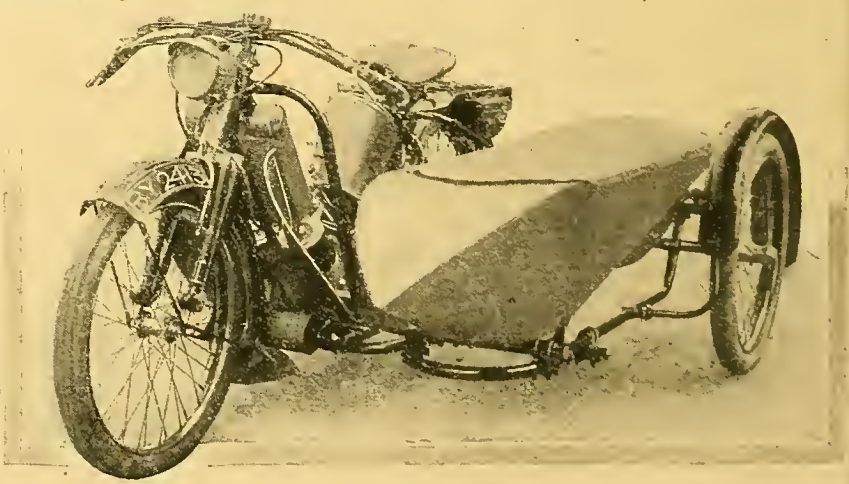
A transfer port gauze, which has become clogged with burnt oil through back-firing, is one of the most puzzling things to clean, and it is a common impulse by the novice to try and dislodge the deposit from the interstices in the gauze by brushing or jamming it with a stiff brush or something of a similar nature. It can be done after a style by this method, but it is an unsatisfactory job at the best. The writer cleans the gauzes of his engine in the manner shown in the sketch. The Scott gauzes are built up of two pieces of gauze separated by an oblong piece of lead packing, the whole pressed together to make it air-tight at the edges. If a pen-knife blade is used to lever three or four strands of wire gently from one corner away from the lead, it becomes quite easy to pull one of the gauzes carefully away from the packing with the fingers. In order to render the choked dirt that is revealed inside easily removable with a stiff wire brush, it is necessary to dip the whole gauze in paraffin, so as to wash away all loose oil: it may then be heated all over with a match to dry the deposit. It will now be found that when one leaf of gauze is pulled away the dirt inside brushes away like fine powder. Great care must be taken *not* to pull the gauze right off the lead packing, otherwise the final procedure of pushing a gauze back into position and gently hammering it back into the lead packing will be spoilt.



Transfer port gauze opened up to facilitate removal of burnt oil deposit.

Both inlet and transfer port covers should be scraped and cleaned in a similar manner to the cylinders. Similarly, the little half-compression valve in each cylinder can be removed with the special tool provided, and if they are suspected of leakage, the valves should be ground in with a little fine emery and thin oil. Wash them in paraffin afterwards and replace in cylinders.

(To be continued.)

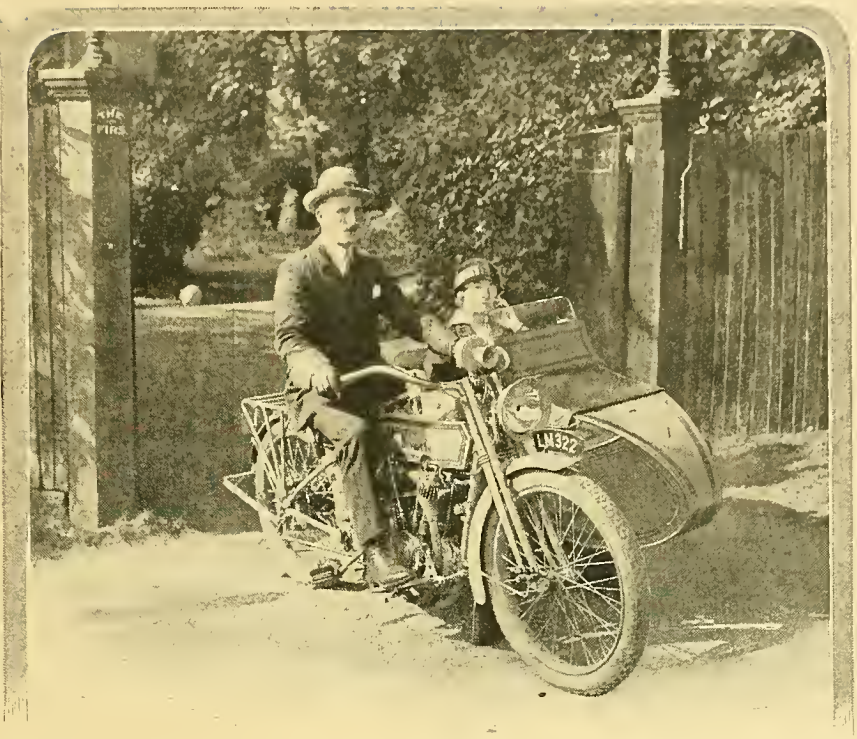


The writer's Scott and sporting sidecar.

ROAD TESTS OF NEW MODELS.

The 7-9 h.p. Harley-Davidson Sidecar Outfit.

Two cylinders, 84×89 mm. = 989 c.c.; mechanical lubrication; three speeds and chain drive.



IT was on the occasion of the wounded soldiers' sidecar outing, described in *The Motor Cycle* of June 24th, that we had an opportunity of trying for the first time on the road one of the new Harley-Davidson passenger outfits, which had been placed at our disposal for this particular purpose by Messrs. Robertsons' Motors.

A Smooth Working Clutch.

We took the machine over from the firm's depot at 157, Great Portland Street, on the previous afternoon, and had a good opportunity of gauging its capabilities in negotiating traffic on the way from that part of London to our own garage. We found the clutch to be delightfully sweet in action, though to anyone not accustomed to handling it the degree of movement seemed to be somewhat greater than was absolutely necessary. With regard to the twist handle control, we can quite understand that this is highly appreciated by a driver who is the actual owner of one of these machines, but the writer who is accustomed to driving all makes found it difficult to get into his mind the direction in which to turn the handle to close the throttle, and, moreover, it is difficult to see at a glance whether the throttle is open or shut.

Captain J. E. Hollington, of the 2/5th Gloucesters, on his 7-9 h.p. Harley-Davidson.

To revert to the clutch. We learnt afterwards that it is not desirable when driving slowly to engage the clutch to the fullest possible extent, as if it is only partially engaged a small amount of slip is allowed to take place, which is just sufficient to take the initial shocks of the engine off the chains, and so to cause the combination to run with a great deal more sweetness than would otherwise be the case.

The sidecar fitted was rather narrow, and so the machine required some amount of care, especially when turning left-hand corners, but a new batch of sidecars is being manufactured specially for this model which are a great deal wider, so this trouble will not be again experienced.

One of the features of the Harley-Davidson which appealed to us most was the automatic Schebler carburetter, which provides a wonderful degree of controllability.

On the Brighton Road.

On the following day we made our way down to Worcester Park, the machine being in excellent condition. When a start was made at Ewell with a wounded Belgian on board, we began to get a good idea of the behaviour of the outfit on the open country roads. Once on the broad highway to Brighton, the throttle was opened, and a steady pace of about 30 m.p.h. was maintained. In fact, this appeared to be about the machine's best speed. We did not attempt any faster speed so as to avoid shaking our passenger, who had been somewhat badly wounded. The run demonstrated the fact that the particular combination we used was rather too highly geared for sidecar work, and a change down was necessary at Peas Pottage on the outward journey, and at Handcross and Reigate hills on the way back.

Two points specially struck us as being excellent in every degree, and of these one was the steering

Road Tests of New Models.—

of the combination, which was one of the best in this respect we have ever driven, and the other was in the comfort of the saddle.

The Advantage of Mechanical Lubrication.

It was indeed pleasant to find that the lubrication of the machine was entirely taken out of the driver's hands. Once, because the machine was new, we put a little oil from the hand pump into the crank chamber, but for the rest of the trip the well-designed automatic pump was allowed to carry out its duties of lubrication. It is interesting to note that the oil used in this machine is of the thinnest possible variety, and would be looked upon with suspicion by the average English motor cyclist.

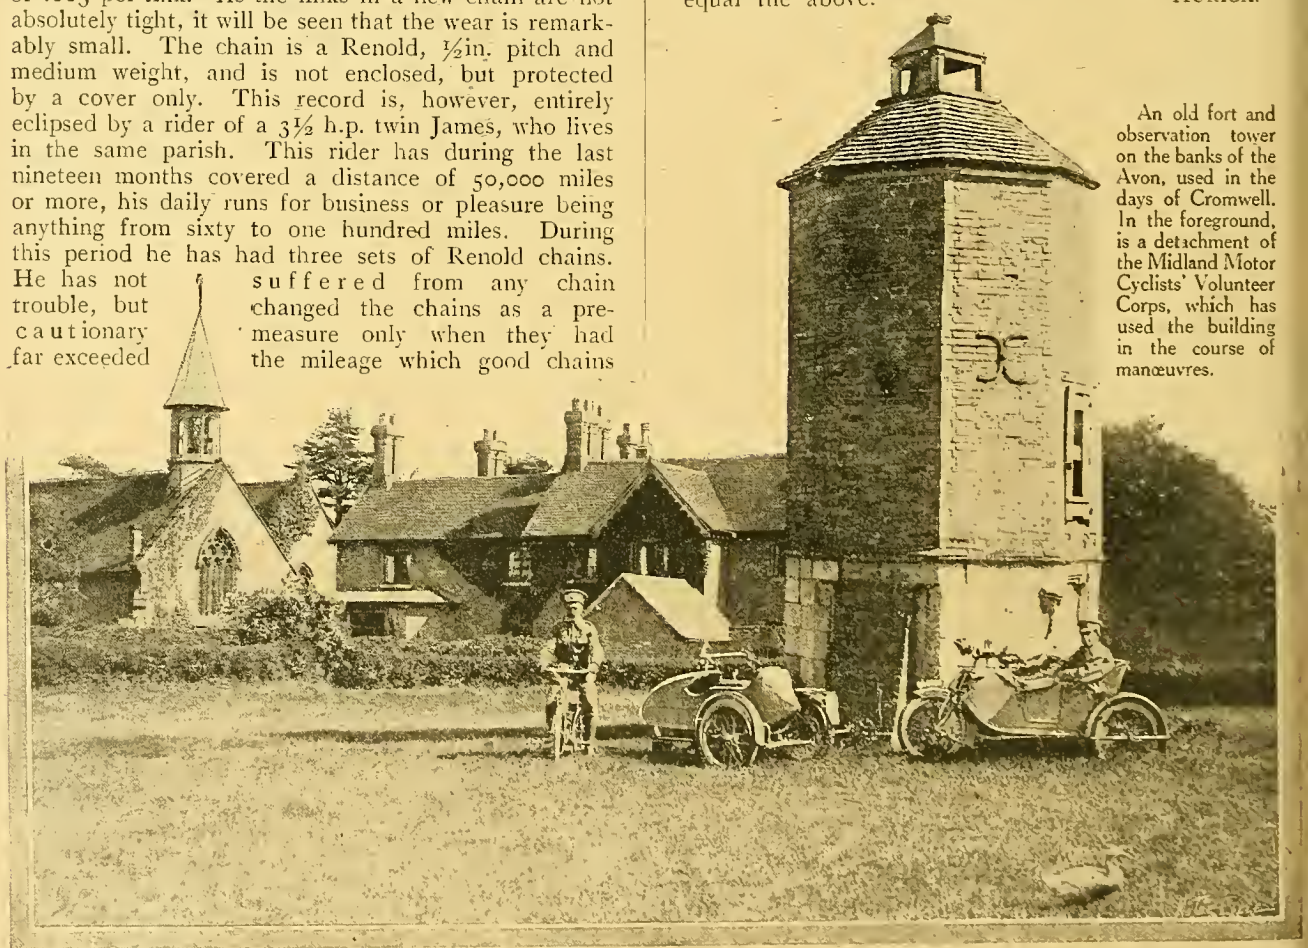
The spring forks seem to do their duty admirably, while the interlocking mechanism on the change speed gear, which prevents the gear from being engaged when the clutch is in engagement, is a most ingenious feature. The particular model we were driving was equipped with the Remy Electrical Co.'s electric lighting system, which also worked the horn. The head lamp was of the two-bulb variety, and we had occasion to use the small bulb in traffic on our return to town, and found it most satisfactory. Our passenger was most enthusiastic about the comfort of the sidecar.

It is interesting to note that the horn is cut out of action by means of an automatic switch as soon as the engine stops, thus preventing children or mischievous persons from tampering with it when the outfit is left standing in the roadway. The riding position is comfortable, and altogether the machine impressed us very favourably, though undoubtedly for sidecar work it would be better for a lower gear, larger filler caps, and one or two minor alterations which will doubtless be embodied in the 1916 models.

CHAIN STRETCH.

WHEN I removed the rear chain from my 3 h.p. Enfield recently for cleaning purposes I laid it on the bench and measured the play in the links, the distance run being upwards of 5,000 miles in all weathers. The amount of play in the entire chain of 120 links was not more than .375 inch, or .003 per link. As the links in a new chain are not absolutely tight, it will be seen that the wear is remarkably small. The chain is a Renold, ½in. pitch and medium weight, and is not enclosed, but protected by a cover only. This record is, however, entirely eclipsed by a rider of a 3½ h.p. twin James, who lives in the same parish. This rider has during the last nineteen months covered a distance of 50,000 miles or more, his daily runs for business or pleasure being anything from sixty to one hundred miles. During this period he has had three sets of Renold chains. He has not suffered from any chain trouble, but changed the chains as a precautionary measure only when they had far exceeded the mileage which good chains ought to run without trouble. In this case both chains are enclosed. These experiences conclusively prove the extreme reliability of chain drive when properly carried out with chains of good quality. One often hears of excellent performances achieved by belts, but I fancy they would be hard put to it to equal the above.

AURIGA.



An old fort and observation tower on the banks of the Avon, used in the days of Cromwell. In the foreground, is a detachment of the Midland Motor Cyclists' Volunteer Corps, which has used the building in the course of manœuvres.

THE NEW COUNTER-SHAFT

ROVER

Extract from Ireland's "Saturday Night":

RELIABILITY TRIAL IN CONNECTION WITH THE ULSTER CENTRE OF THE MOTOR UNION.

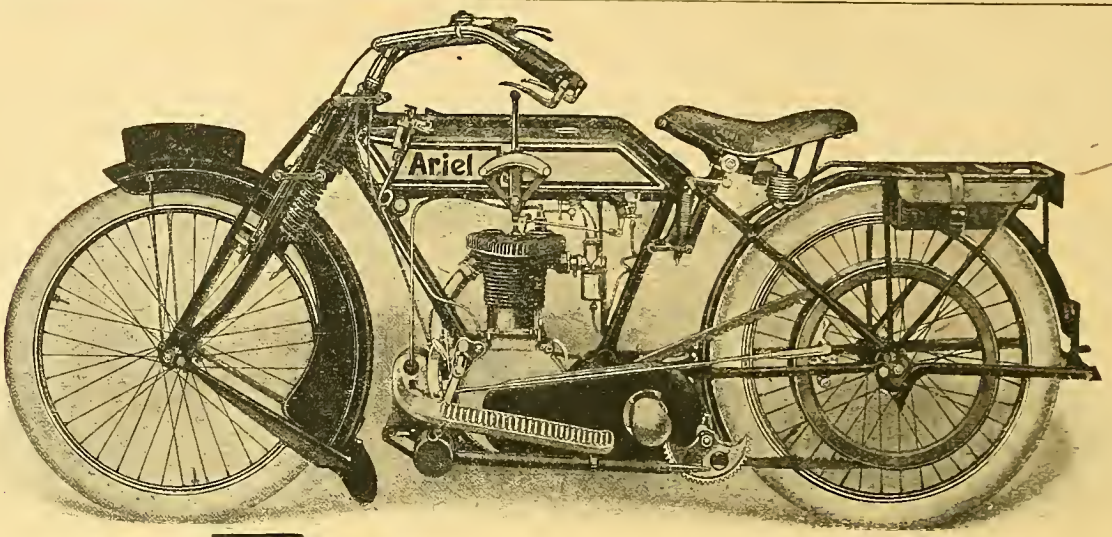
"George Graham (3½ h.p. Rover and Sidecar) was first . . . . . .

"I am sure that all his fellow-competitors will agree no better sport could have won the event than George Graham, whose new Rover covered itself with glory by the way in which it took all the test hills including the terror at Feestown. It was a supreme test of hill-climbing for a passenger mount of such moderate horse-power."

SIDECAR COMBINATION COMPLETE

£80 : 0 : 0

The Rover Co., Ltd., Meteor Works, Coventry.



A TRIO OF TRIBUTES.

THE FINEST 3½ H.P. IN MANCHESTER.

"I consider I have the finest 3½ h.p. in Manchester. I have done as much as 160 m.p.g. with passenger, and touched 50 m.p.h. with sidecar and passenger."

F. SPEAKMAN, Esq., Manchester.

WILL HAVE NOTHING BUT AN ARIEL.

"A postman who bought a 3½ h.p. Ariel from me in 1913 will have nothing but an Ariel. It is a splendid machine. After never less than 200 miles a week since February, 1913, it is pulling as well as ever."

AN ARIEL AGENT.

GIVING EVERY SATISFACTION.

"The Ariel is giving every satisfaction. It took my wife, boy, and baggage, recently over Kirkstone Pass in the Lake District, without a murmur."

THE MOST DESIRABLE MOTOR CYCLE

In answering this advertisement it is desirable to mention "The Motor Cycle."

TO REDUCE VALVE CLATTER.

Designs Adopted to Minimise the Noise.

WE have more than once made mention of that very undesirable noise—valve clatter—which is far too common on many makes of motor cycles. The very fact that a valve makes a noise shows that it is hammering on its seating or that its stem is being hammered by the tappet far more than should be the case. It is not difficult to design valves which shall be quiet in action at the cost of efficiency, but to combine efficiency and quietness is some-

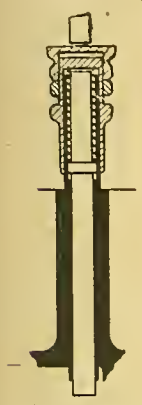

Fig. 1. An adjustable tappet, the head of which is kept in contact with the valve stem by a light spring. The tappet guide is extended to prevent the leakage of oil.

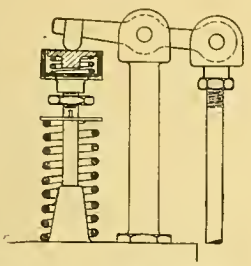

Fig. 2. An adjustable valve stem for an overhead valve, similar in principle to the tappet shown in fig. 1.

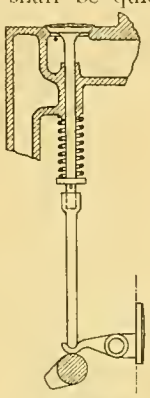

Fig. 3. Dispensing with tappet guides; the tappet is suspended between the valve stem and cupped rocker.

thing of a problem and one which is not entirely solved at the present time, although, as the examples we give on this page will show, inventors and manufacturers have not been altogether idle. It is obvious that if the valve stem and valve tappet could be kept in constant contact no noise would occur at this point. Owing to the expansion of metals by heat this is only possible by interposing a spring or springs to keep the tappet pressed against the valve stem, the result of which is to introduce noise at another point, viz., between the tappet and the operating cam. or rocker. Noise here is less noticeable as the parts are enclosed in the timing gear and are supplied with a liberal amount of oil from the crank case which materially helps to deaden the sound. It is upon these lines that most inventors are experimenting, as evidenced by our illustrations.

To design a cam which will give a maximum of efficiency by means of a quick lift and drop of the valve and yet return it slowly on to its seat is not easy, but such a cam is shown in fig. 6. In this case the drop is very quick until the last moment before closing, when a projection on the cam causes the valve to fall quite gently. If such a cam would allow the engine to turn backwards it would seem to be a satisfactory solution of the difficulty. It is very desirable that this noise of the valve gear should be reduced as it is most irritating to many, but it must be done without any appreciable loss of efficiency—a quality so dear to the heart of every motor cyclist, and herein lies the *crux* of the problem.

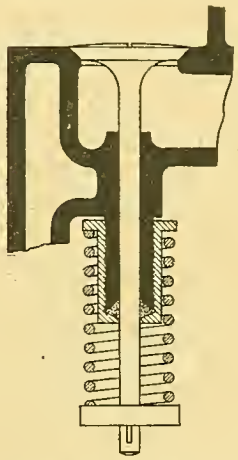

Fig. 4. A method of lubricating the valve stem; a stuffing box formed at the lower end of the valve guide is filled with graphite. This also prevents the passage of air or gas.

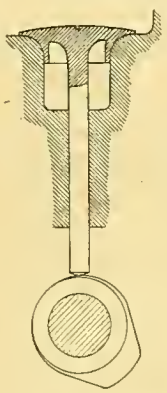

Fig. 5. A specially shaped valve, which prevents nearly all passage of gas when not quite seated; the final movement can therefore be slow.

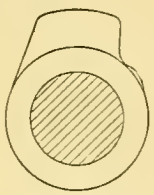

Fig. 6. A diagrammatic sketch of a special cam which allows the valve to return gently to its seat.

Touring the Overseas Market.

WE have received from Auckland, N.Z., a letter from Mr. J. W. Sparke, who, as we announced some time ago, is making a tour overseas on behalf of his firm, the Lloyd Motor Engineering Co., Ltd., of Birmingham. The joint enterprise of Mr. Sparke and that of his company is meeting its just reward, for a large number of orders have been handed to Mr. Sparke. Enclosed with his letter was an interesting photograph of a *châlet* on Mount Egmont (8,270 feet), North Island, N.Z., and a motor car and motor cycle trip was organised for the opening ceremony. In the foreground there is an L.M.C. motor cycle and sidecar, this being the only outfit of its kind to negotiate the climb. As a matter of fact, only ten out of a total of twenty-five vehicles which started managed to get up to the *châlet*, mainly on account of the road surface, which is very bad.

Mr. Sparke had already been in India when he wrote us, and, after completing his business in New Zealand, he will return to Australia. His next trip was to have been to Japan, but at the time of his writing matters looked very serious between Japan and China, and the Yokohama agents for the L.M.C. cabled Mr. Sparke to postpone his trip.

It was his intention to return to England *via* America, but the air having since been cleared in the Japan-China outlook Mr. Sparke may have decided to proceed with his original programme.

We have always been strong advocates of the practice of personally seeking business in the British Empire overseas. American competition is very keen in our self-governing dominions and colonies, and to take adequate steps to meet it it is necessary for British manufacturers to send out representatives to study local conditions and look after agents.

Some Notes for Fast Tourists.

HOW TO ATTAIN A GOOD AVERAGE WITHOUT RECKLESS DRIVING.

THESE few remarks are by one who, although not a prominent race rider, can claim to have covered his total mileage at an average speed well above the ordinary. It is in no way intended to appeal to those who aim at sheer maximum speed for short distances only: the article is meant to be interesting to the motor cyclist who wishes to make the most of his time on the road without indiscriminate "blinding," but who wishes to travel at a good average speed.

Average Speed.

First of all, let us define "average speed," a term which many seem to misunderstand. It is not the figure to which the speedometer needle generally points on a long run, and neither, unless specially stated, is it the distance travelled divided by the number of hours between setting out and arriving at one's destination. It is the number of miles actually travelled divided by the number of hours that the machine is actually in motion. This, so far as pure average speed is concerned, should be obvious to all, but for practical purposes in comparing the merits of different machines, the time spent in involuntary stops should be included, for a machine which does thirty miles in an hour, takes an hour's roadside adjusting, and then covers the next thirty miles in an hour, has the same average speed as a machine which consistently covers twenty miles in the hour. For solo work any machine fitted with a modern engine of over 500 c.c. capacity, and kept in good tune, is very fast, and the average speed of any such mount depends more on the skill and capability of the rider than on the size of the engine.

This type of machine has been developed and brought to such a high pitch of efficiency that for solo work no want of power is likely to be felt if it is well driven and cared for. Another point in its favour is low running cost.

The majority of riders, however, seem to want something which will keep the speedometer hand at a high figure when riding solo on the open road, is docile in traffic, economical to run, and yet, when a sidecar is coupled up, will be capable of taking a passenger without losing the life and vigour of a solo machine.

Let it be said here that the writer entirely disagrees with a high average on a sidecar combination. To obtain such, it is necessary to take the corners and bends without slowing up very much, and high speed cornering on such an unmechanical contrivance as a sidecar imposes strains on the frame tubes far in excess of the safety mark.

Having ridden almost every type of machine from a 1¼ h.p. Motosacoche to an 8-10 h.p. Zenith with and without sidecars, the writer is of opinion that a 5-6 h.p. twin with some form of variable gear, kick-starter, and clutch is the ideal for such a double-purpose mount as is under discussion. A big 1,000 c.c. twin in good tune may be flexible, easily started, and, for sheer maximum speed, cannot be beaten, but the extra power and speed are merely a danger, and, further, the additional weight is disadvantageous in traffic, in grease, and for the rider's comfort. The petrol and oil consumption is decidedly higher than in the 5-6 h.p. twin.

Turning to the lower powers, we have the 3½ h.p and 2¾ h.p. singles and twins.

Now, except in expert hands and in tip-top tune, over twenty miles in the hour for any length of time on a 3½ h.p. and sidecar requires a good deal of doing, and also the life and response are in many cases woefully absent. For ordinary touring a 3½ h.p. and sidecar is quite sufficient, but, if mere vim, which is the mustard to the beef of motoring, is required, there is not quite enough power.

The 2¾ h.p. machine of the popular horizontal type can compete very favourably with many 3½ h.p.'s for solo work, and is very handy for all traffic riding and very occasional sidecar work, but a passenger on the carrier is distinctly felt by the willing little engine.

Thus we see that, for the man who cannot spend much timing in "tuning," but who wants to cover his hundred miles solo in as little time as possible, consistent with comfort and safety, and who, when in want of companionship, wishes to take a passenger without overtaxing his engine, the light 5-6 h.p. twin with a variable gear and clutch will suffice.

As a solo mount there is, of course, ample and almost a surfeit of power, still it is economical, efficient, and tractable, and as a passenger machine will pull a comfortable coachbuilt sidecar up any non-freak hill and without nursing or special tuning.

Avoid High Gears.

There is no greater mistake which one can make when in search of a good average speed than to overgear the engine. A petrol engine is designed and meant to "rev." and to develop power when turning over rapidly. A high gear means either "konking" or unnecessary "revving." owing to a forced gear change when climbing or in traffic; the drive becomes jerky, resulting in wear on the transmission and tyres, whilst the engine overheats far more readily.

With a low top gear, say 4¾ to 1 on a 3½ h.p. single, quite as much speed can be obtained on the level, provided the engine is accurately balanced, as with a high top gear, and the machine will romp up hills without changing into a second gear of, say, 7 to 1. A consistently good speed is required for fast touring, and time lost on a low gear on a long medium-graded slope means "blinding" on the level to make it up.

When taking off or putting on the sidecar, a change of gear ratios is very desirable. With a belt drive

Our pleasure.

Readers may have noticed that, since September last, we have repeatedly claimed in our advertisements that "the Clyno Combination is, as far as we can ascertain, the only Combination expressly designed for sidecar use which the War Office is ordering."

Before issuing the above we obtained the sanction of the War Office to do so, and, further, secured their assurance that the claim was correct, but even then we were careful to insert the qualifying phrase—"as far as we can ascertain"—as we were most anxious to avoid causing any injustice to other manufacturers. Having received no disclaimer after several months of advertising we, recently, announced the claim in more emphatic and concise terms, briefly stating that "the Clyno is the only sidecar combination being ordered by the War Office."

We now learn that another well-known firm of Motor Cycle manufacturers have been and are now supplying a special department of the War Office with a single-cylinder machine to which a sidecar is attached, hence we willingly, in justice to them, modify our claim to the one we originally made, and—

We do this with pleasure.

Keep in touch with us.

M.C. 300

Some Notes for Fast Tourists.—

and adjustable pulley this is, of course, a simple matter, and even with a chain drive the operation is fairly easy to perform.

As to lubrication, naturally a good brand of oil must be used, and usually the thicker it is the better. Lubricant with the consistency of water when heated up is no use at all; a proper lubricant remains as oil with body in it under almost any conditions.

Hard tyres are faster than soft, and do not roll on corners. T.T. or semi-T.T. bars are a hundred per cent. better than the upturned patterns, and all controls should be on the handle-bars. Two pairs of footrests really do help on a long journey.

Tall Tales.

Do not believe the tales told in garage yards and roadside inns any more than you are forced to by etiquette. Many people are very fond of adding a few artistic flourishes to their performances.

The man who blinds into the yard and announces that he has just done twenty-five miles in thirty-four and a half minutes should be encouraged, and after a little time will inform you that perhaps his best show was when he climbed "Sludgeside" (average gradient 1 in 3½—1 in 1½ for ten yards) on a wet night on one cylinder with the petrol turned off.

No; a man who does anything over thirty-five miles in the hour for any distance is "some" rider, and, except by fools who take terrible risks, over forty in the hour is well nigh impossible. If a hundred miles of give and take roads are covered in three hours, the rider can feel quite pleased with himself, and with good cause.

Do not imagine that a decent average will be put up by blinding from one pub to the next; it is the machine that keeps "revving" nicely up hill and down dale that will have outdistanced all before nightfall.

With regard to personal comfort, wear plenty of clothes and a good water and dustproof outside covering. Breeches and leggings are distinctly comfortable, and look smarter than a pair of bagging overalls. To keep clean, keep out of other people's dust; if you are the faster, pass straight away if possible, and don't hold back in a dust cloud waiting for a better opening.

In conclusion, there will probably be many who, having read this article, will decide that the writer is a blinding fool urging others to risk their necks. This, it is hoped, is the wrong view, and, as said before, the aim of the article is to give a few hints to those who wish to put up a good average speed in safety and comfort.

MILES.

THE JOY OF THE OPEN ROAD.

"THE MOTOR CYCLE" RECRUITING SECTION.

Vacancies Still Existing in the Motor Machine Gun Service.

A VERY large number of enquiries from prospective recruits were dealt with last week, the total dealt with by the Editor since the M.M.G.S. was inaugurated considerably exceeding 2,000.

Many push-cyclists are anxious to get into the Service, but only a very limited number of men of this class of good physique may be accepted.

Experienced motor cyclists are desired at the moment, preferably men with sidecar experience. Men who have had previous military experience are specially desired. General conditions:

Age, 19 to 38.

Enlistment for duration of war.

Usual separation or dependent's allowance.

Pay, 1s. 2½d. per day, all found.

Height is not important, and glasses do not debar a man so long as he can see quite well with them.

Among the men accepted last week were the following:

C. V. Lewis-Jones
G. Darker-Gudgeon
J. F. Harkness
W. L. Rawlins
H. Monks
R. Hargreaves
K. W. Leake
J. R. Lane
C. A. Hall
R. E. James
F. Robinson
C. I. Britton
C. G. Bodle
T. Joyce
R. Berry
P. Whyte
A. Williams
H. Kelsey
C. T. Barker
J. R. Lewis
E. W. Jeffrey
C. P. B. Ogilvie
F. A. Burnett

A further inspection of recruits is to be held at the Recruiting Office, Masonic Hall, Coventry, on Wednesday next, July 21st, and all who can should attend. Mr. Geoffrey Smith (Editor *The Motor Cycle*) will be in attendance to answer any enquiries, and those accepted will be attested and sent forward to their training centre. In the case of men living at a distance, a free railway warrant will be issued, provided a man first obtains a medical certificate of fitness.

WAR OFFICE,

30 June, 1915.

Sir,

I wish to express to you personally, and to those who have helped you in your recruiting work, my best thanks for the energy that has been displayed by you all in the matter of Recruiting.

I would ask you to take an early opportunity of urging all able-bodied men in your neighbourhood to come forward and enlist, so that they may be trained as soldiers to take part in the War, and help to keep our forces in the Field at the maximum strength.

I shall be glad to hear of any reasons that may be given you by young and suitable men for not availing themselves of this opportunity to see service in the Field, where they are so much wanted.

I am,

Sir,

Your obedient Servant,

Geoffrey Smith Esqr

Kitchener

Fac-simile of letter received by the Editor of *The Motor Cycle* from the Secretary of State for War.

The two men of No. 4 Battery who have been awarded D.C.M.'s will receive the congratulations of all motor cyclists. Their names are Sergeant J. S. Clarke and Gunner J. Rafferty. These awards were made for "conspicuous devotion to duty" in the operations at Hill 60 on April 17th and 18th.

Some motor cyclists write several long letters, with all sorts of statements not affecting recruiting. To ensure prompt attention to the large number of letters, brief applications mentioning age, height, when free, and if medically fit should be sent. Two Eastbourne motor cyclists, C. T. Barber and J. R. Lewis, were so anxious to join last week that they did not write at all, but paid their own fare to Coventry, and, two hours after being passed by Mr. Smith, had been attested, received their day's pay, and were on the way to the training centre.

T. E. Greene, of Dublin, the erstwhile Rudge T.T. and End-to-end rider, now with the A.S.C. (M.T.), was home for a few days' leave last week.

So keen are some men to join the M.M.G.S. that the Editor has received applications from four men already on service in France to be transferred. This, however, is impossible.

Among the last list of recruits the name of L. A. Bees may have been noticed. Bees was the competition rider and tester for the L.M.C. Co., and now joins other well-known mechanic-riders in the M.M.G.S., such as F. H. Brown (Rex), Fielder (New Hudson), Cocker (Triumph), Ponntney (Rover), and Davenport (Lea-Francis). Bees brought two friends from Birmingham with him, and all went home again on the single-geared twin L.M.C.—one astride the tank, Bees driving, and the third on the carrier. Naturally, it made the countryside stare in amazement.

MOTOR CYCLING CLERGYMAN ON ACTIVE SERVICE.

IN a postcard received from the Rev. R. M. Bankes-Jones, on ambulance work with the B.E.F., he tells us that though he does most of his work on horseback he manages to get occasional trips on a Douglas or Triumph. Mr. Bankes-Jones will be remembered by many of our readers as a keen rider and an occasional contributor to *The Motor Cycle* of articles on touring and kindred topics.

Bates-built at the "Front."

MORE SPEED,
MORE SAFETY,
MOST MILEAGE.

W. & A. BATES, Ltd.,
Leicester. 21st June, 1915.

Gentlemen,

I feel that I must write to you and express my appreciation of your Motor Cycle Tyres as being second to none. Owing to the fact that I experienced no trouble from a Bates Tyre in civil life I fitted one to a Douglas before coming to the front. Roughly, the tyre ran for about a month in England and six months with the B.E.F., on roads more fitted for a steam roller than a motor cycle, without a puncture or without once being deflated, and, surprising as it may seem, the tyre was as good as new when evacuated with the machine. I don't know whether this constitutes a record or not, but I think it really marvellous.

Yours faithfully,
(Signed) G. S. GARRARD, L.-Cpl.,
Despatch Rider,
Leicester Yeomanry,
B.E.F.

P.S.—The Tyre I bought first from you is now at my home in England fitted to a Triumph M.C., and was when I left as good as new, although it had been run considerably.

W. & A. BATES, LTD.,
St. Mary's Mills, Leicester.

Depots—LONDON, GLASGOW, and NEWCASTLE.

Bates SUPER RUBBER Tyres

"The tyre of no regrets."

To the J.H. Motor Works, Oldham.

Sirs,—I am writing to state that for the short time I have ridden your J.H. 3½ h.p. Twin, it is only in justice to you to state that the machine has never given me a moment's anxiety, and really is, in my opinion, the ultimate machine for solo work on all kinds of roads—easy starting, silent running, acceleration, and speed, being but a few of its good points.

You may use this testimonial as you please. I am in no way connected with the firm.

BOWDEN WIRE LTD. LONDON

PRATT ST. N.W.

BOWDEN WIRE MECHANISM.
For effectively controlling all movements from the handle-bar. Made in various strengths and finishes.

BOWDEN CONTROLS.
Levers for Brakes, Clutch, Air Inlet, Magneto, etc., controls. Made for right or left hand, for one to three movements.

BOWDEN TWO SPEED GEAR.
A very simple countershaft gear with kick-starter. Can be fitted to a number of machines without any—to most with slight—alteration. Guaranteed for engines up to 6 h.p.

BOWDEN RAPID VALVE GRINDER.
Helps to grind a valve quickly and with absolute accuracy without dismantling the cylinder. Most efficient. Acts also as Valve Spring Lifter.

STOPS, PORTABLE CLIPS,
Etc., and all necessary fitments for use with Bowden Wire Mechanism.

Godbolds.

On Active Service with the M.M.G.S.

News from a Member of the No. 10 Battery now at the Front.

WE have received a letter from A. G. C. Wheeler, who is now with the No. 10 Battery M.M.G.S. over in France. It is one of the most interesting letters we have received from the Front, and we reproduce it *in extenso*, as it gives a very good idea of the work of the men in France.

"As you have taken a big interest from the first in the M.M.G.S., I thought a few notes as to how we get on out here would interest you.

"In the first place, I have not heard yet of any battery going into action complete, *i.e.*, riding the motor cycles right up to the spot where the guns were fired.

"Of course you remember the double-page illustration in a contemporary depicting a supposed scene near Hill 60, where the machines had just been rushed up and everyone was firing very busily—well, on this particular occasion the guns were taken up to their position the night previous in box body cars.

"The motor cycles are very useful for transporting the guns from place to place. No. 10 Battery has had twelve different billets in the eight weeks it has been in France.

"At present we are doing spells in the trenches—two sections in and one out—eight days in and four out. We come about five miles from our billets in the box body cars—right up to the last line of trenches—and then have a walk of about a mile and a half to reach our position, which is on the extreme right of the British lines, and has in front of it a fairly well known orchard and crater. There is very little rifle fire—only the occasional 'crack!' from a sniper, of whom there are two or three quite near.

"We have far more shells than anything else—happily for us, most of these pass overhead—as their objective is on both sides the opposing artillery positions. Of course, we do not get all the shells passing overhead. We had quite two dozen this morning dropping just before and just over our position, which was not actually hit, although four of our fellows were struck by pieces of shell.

Despatch riders attached to the Royal Flying Corps studying a map. The four machines are P. and M.'s.

Artillery Dominates Everything.

"I have been out here two months and have not yet seen a German. In fact, the last time No. 10 Battery was in the trenches one of the Warwicks told me he had not seen a German, although he had had two months facing their trenches, which were only 150 yards away. This is partly accounted for by the fact that the Germans fire through loop-holes in their parapets. My impression is that the Artillery dominates everything else in this war.

"No. 7 Battery has not yet been in the trenches, although it has been out here three months. It is attached to a cavalry division, and this accounts for its inactivity up to the present. No. 10 is billeted in the same field as No. 1 Battery. We rather envy No. 1's Daimler cars, but this is more or less equalised by the fact that our motor cycles are better equipped.

"No. 3 has had about eighteen casualties so far."

Midland Motor Cyclists' Volunteer Corps.

The Advantage of Special Training.

THE corps on Thursday paraded at headquarters to hear the commandant's criticism on the work done, and to have explained the schedule for future training.

The corps was formed in March last, with the idea of banding together a body of motor cyclists to be trained for home service, and to assist in promoting recruiting for H.M. Forces, the training to consist of despatch riding, scouting, signalling, vedette and outpost duty, reconnaissance, and patrols. The men's work has been submitted to the highest military officers in the Seventh District, and has met with their approbation. Several members of the corps have joined the Regulars. Further, a number of men (fifty in all) has been placed on the list to act as Special Constables in the Birmingham district.

The corps now commences the second and more difficult stage of its training. On future parades the men will act more on their own initiative. Each man will now be trained so that if occasion arises he can at once take command of any unit of despatch riders.

Home from the Front.

The commandant lately received a visit from Sergeant H. Newman, of Ivy fame, who went to the Front last August. Sergeant Newman is convinced that no man should attempt to become a despatch rider before he can read a map. He said that competitions and the Tourist Trophy had their thrills, but not such thrills as are experienced by our despatch riders at the Front. On many nights have they turned out in inky darkness after a hard day to carry important letters through a strange country invested by the Germans.

Sergeant Newman is full of enthusiasm, and has gone back with a stout heart.

The following is another instance of the advantage of training the motor cyclist as a scout: A member of the corps had joined the machine gun section. The battery commander gave the men a reconnaissance of a road; each man had to make a report.

The reports were examined, with the result that the late member has been appointed scout for the battery; the battery leaves for the Front next week.

Incidents like these certainly encourage the corps to persevere in its training.

On Sunday the corps paraded for an attack on the village of Ashow. Reds and Blues were the opposing forces. Each advanced by parallel roads with intersecting roads on Ashow. The first force arriving there had to hold the village against attack.

On Saturday next the corps parades at the Style Cop hill-climb to give a display. The heads and posts will be on the hill. Competitors ride up, cut off two heads, and point off the ring. The one who does the three and makes fastest time wins.

Race in Sweden.

The Swedish race known as the "Skaane Rundt" has recently been held over a distance of 255 miles. In the class for machines of under 4 h.p. three Wanderers, one Wolf, one N.S.U., one Rudge, and one Indian started, but, as showing the severity of the race, only three finished in the following order: Rudge, Wanderer, Wanderer. The winning Rudge was riden by Mr O. Bendixen of Copenhagen, who won the same race last year.

A.A. and M.U. Notes.

OBSCURING INDEX MARKS ON SIDECARS AND MOTOR CYCLES.—Motor cyclist members of the Automobile Association are warned that the authorities in certain counties are serving summonses for the offence of not clearly showing the rear numbers on motor cycles. Among cases already heard, the following causes of offence were brought forward: A lady sitting on the carrier, the cushion had shifted and obscured the number-plate; coat-tails of male passengers on carriers covering the numbers; in another case a parcel hid the number. The front number on a passing motor cycle cannot always be seen, therefore the police authorities are, as a rule, very strict with regard to a clear view of the rear plate.

Lost Toolbag.

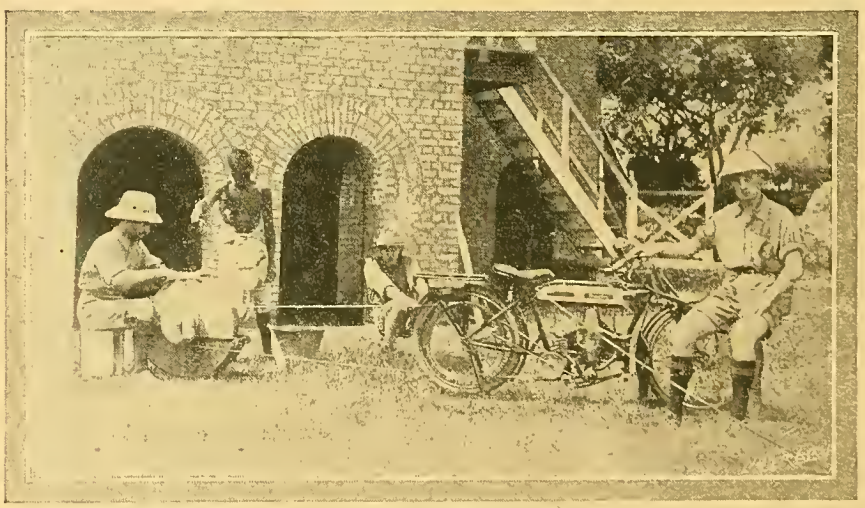
A military rider of a Triumph lost his pannier bag between Brentford and Newbury in the afternoon of June 5th. If any reader should have found it, would he kindly forward to Lance-Corporal A. S. Rivett, No. 055,251, 357 Company, M.T., A.S.C., Stockcross Camp, near Newbury?

'Ware Police with Revolvers.

The absolute necessity of immediately stopping when called upon by either soldier or police constable was emphasised a few days ago when a Richmond (Yorks.) medical man was fined £2 for not stopping. Defendant, who stated that he was hurrying to an urgent case, was motor cycling past Scotch Corner on the Great North Road at midnight on June 27th when the police constable raised his red lamp and called upon him to stop. He did not do so, and the constable fired his revolver at the motor cycle and missed.

High Speeds in U.S.A.

At the Dodge City Speedway, Kansas, U.S.A., on June 28th, some of the most prominent American crack riders contested a 300 mile race for the International Grand Prize Cup. Otto Walker, on a Harley-Davidson, came in first at an average speed of 76 m.p.h.. Time, 3h. 55m. 45s. Harley-Davidson machines finished first, second, fourth, fifth, sixth, and seventh, thus securing an overwhelming victory. An American Excelsior occupied the third place. There were twenty-seven starters.



A novel method of driving a grindstone. The photograph shows a Douglas (owned by Lieut. C. C. D. Hobbs, Garrison Engineer, Ambala, Punjab), which is driving a grindstone for sharpening bayonets.

Sidecar Outings for Wounded Soldiers.

Any London motor cyclist who would care to give a wounded soldier a day's pleasure by taking him in his sidecar from King George's Military Hospital, Stamford Street (near Waterloo Station), to Teddington, should write to Quartermaster-Sergt. W. D. Atkins, Ward E5, at the above named hospital.

The Motor Cycle Trade.

The Board of Trade returns for June show a tremendous increase in the numbers of motor cycles imported into this country over both the previous month and the June, 1914, figures. The totals and amounts are as follow :

IMPORTS.

June, 1915.—822 motor cycles, value £34,990 (including parts, £65.671).
May, 1915.—331 motor cycles, value £16,982 (including parts, £34,200).
June, 1914.—400 motor cycles.

Slight Increase in Exports.

Although, of course, the number of machines exported last month, compared with the same period of last year, is considerably less, the June, 1915, figures show a gratifying, if small, increase over those of the previous month.

EXPORTS.

June, 1915.—1,020 motor cycles, value £45,128 (including parts, £68,162).
May, 1915.—858 motor cycles, value £36,667 (including parts, £65,221).
June, 1914.—1,950 motor cycles.

Motor Volunteers for Cardiff.

In connection with the National Motor Volunteers movement, a battalion is being formed for Glamorgan, and Cardiff and District will be the No. 1 Company. The latter is now in course of formation, and it is hoped that all local car and motor cycle owners, who possibly can, will join. Motor cyclists are required for scouting, despatch, and patrol work. All interested should write to the secretary, Mr. T. A. James, City Hall, Cardiff.

Motor Machine Guns at the Front.

We publish this week on page 59 a letter from a member of the No. 10 Battery M.M.G.S. now at the Front. One of the most interesting statements is the fact that the writer, A. G. C. Wheeler, has not yet seen a German, although he has been out in Flanders a couple of months and often stationed in the trenches.

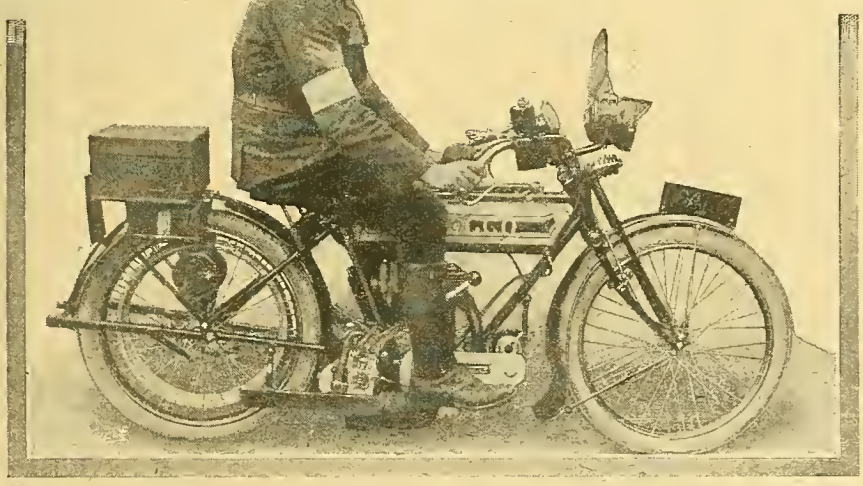
Firms and the War Loan.

We are informed that the Dunlop Rubber Co. has applied for £250,000 in the War Loan; while Messrs. Humber, Ltd., with a view to encouraging their employees to invest their savings in the loan have undertaken to purchase the shares of all those who wish to sell in January next, repaying the holders all sums laid out with 4½ per cent. interest. Thus money which may be wanted need not be locked up beyond that time.

The East London Rubber Co. will purchase £5 worth or more of the War Loan for members of their staff, and will accept payment by weekly instalments spread over an extended period. The firm is also presenting 5s. to each purchaser of a £5 bond, and all accrued interest will be handed over to him on completion of the instalments.

The Price of "The Motor Cycle."

We have received from John A. Hilger, interned at Ruhleben, a postcard referring to the letter written by Corpl. J. H. Dale, and published in *The Motor Cycle* of May 20th, in which it was stated that copies of this journal fetched sixpence each. Hilger writes: "Sixpence a copy is by no means a record, as a few old copies were sold here last January at 2.50 marks (approximately 2s. 6d.) each, and were worth twice that as copies were scarce then. Now more come in and go from barrack to barrack, and are scanned by hundreds. Life here is not so bad now; we have plenty of outdoor sports, concerts, and plays, also science and art schools, but what I desire most of all is to get on my faithful Rover with a route card marked London-Exeter-London on the handle-bar."



6,000 MILES TO ENLIST.

Corporal Fauraine, despatch rider R.E., who travelled all the way from California to enlist. His mount is a 1915 countershaft model 4 h.p. Triumph.

A.C.U. Membership.

Members are requested to note that membership for one year, instead of expiring on December 31st, continues for twelve months from the date of payment, so that under existing arrangements there is no object in a man who thinks of joining towards the end of the year waiting till January 1st, since if he joins when he feels inclined his membership will be available for exactly twelve months.

To Stop Oil Splashing.

One of our readers tells us that he has stopped the oil from his engine being thrown about in the following manner: He first took off the pulley side of the crank case, and with a small round file cut a groove half-way through the bearing, and an oil-way down the outside of the crank case. Having replaced the case he made a tin washer slightly less than the pulley in diameter, and having a projection on one side to cover the oil-way. This is placed in position with a thin felt washer, and the projection attached to one of the crank case bolts. The device, we are assured, is very effective.

A Successful A.A. Prosecution.

Whilst travelling on his car a few weeks back in the vicinity of Wolverhampton a member of the Automobile Association met a taxicab coming in the opposite direction. As the vehicles passed one of the taxi passengers stood up and deliberately threw an egg, which, fortunately, struck the windscreen instead of the occupant of the car. The car was immediately turned, and a stern chase followed. The culprits were ultimately overtaken, and their names and addresses were obtained. The Association, upon becoming acquainted with the facts, decided to prosecute on behalf of the member. The sequel to this flagrant case of assault upon motorists occurred on June 18th, when the Bridgnorth magistrate fined the man who threw the egg £3.

Lights on Motor Vehicles.

The following lighting regulations will come into force in the county of Kent (including the cities and boroughs) from July 19th :

(a.) For motor vehicles, motor cycles, and ordinary cycles burning oil or candles, no change.

(b.) For motor vehicles burning electric light the head lights are not to exceed twenty-five candle power, and the side lights are not to exceed eight candle power.

(c.) For motor vehicles using acetylene, the lights from these are not to exceed the lights from an electric light, *i.e.*, twenty-five candle power for head lights, and eight candle power for side lights.

(d.) The whole of the reflectors, except *(a)*, on all lamps on motor vehicles are to be dull blacked.

(e.) Head lights and side lights, except *(a)*, the upper portion of the glass (from the top to a horizontal line half an inch below the half-way line) to be dull blacked.

(f.) For motor and ordinary cycles, except *(a)*, the lower half of the reflector and upper half of the glass to be dull blacked.

Large Entry List for the Style Cop Hill-climb.

THE Wolverhampton M.C.C. has received a large number of entries for its hill-climb, to be held at Style Cop, near Rugeley, on Saturday next. The start is arranged for two o'clock. All the proceeds will go to the Wolverhampton branch of the Red Cross.

CLASS 1.—Solo machines, single or twin-cylinders, c.c. not exceeding 300.

W. Chinn (2½ h.p. Burnam)
W. J. Clarke (2½ h.p. Wolf)
W. H. Butterfield (2¼ h.p. Levis)
G. E. Kuhn (2¼ h.p. Levis)
G. Brew (2½ h.p. New Imperial)
J. G. Orford (2½ h.p. New Imperial)
C. Lindall (1.9 h.p. Levis)
S. O. Duck (2½ h.p. Metro)
W. T. Berry (2½ h.p. Metro)
A. J. Berry (2½ h.p. Metro)
E. Wheeler (2½ h.p. Villiers)
W. Savage (2½ h.p. Villiers)
H. Newey (2¼ h.p. Levis)
B. H. Morris (2½ h.p. Sun)
R. W. Richards (2½ h.p. Sun)
A. R. Limsworth (2½ h.p. Sun)

CLASS 2.—Solo machines, single or twin, c.c. not exceeding 350.

J. L. Mitchell (2¾ h.p. A.J.S.)
T. C. de la Hay (2¾ h.p. Sunbeam)
G. Dance (2¾ h.p. Sunbeam)
H. Newey (2¾ h.p. Levis)
F. W. Corbett (2¾ h.p. A.J.S.)

CLASS 2 *(Continued)*.

O. Wade (2¾ h.p. A.J.S)
W. Heaton (2¾ h.p. A.J.S.)
S. H. Giles (2¾ h.p. A.J.S.)
J. H. Mason (2¾ hp. A.J.S.)

CLASS 3.—Solo machines, single or twin, c.c. not exceeding 500.

H. Petty (3½ h.p. Norton)
P. Slingsby (3½ h.p. Norton)
J. Smith (3½ h.p. Triumph)
G. Dance (2¾ h.p. Sunbeam)
G Dance (3½ h.p. Sunbeam)
C. G. Lambert (3½ h.p. Norton)
J. W Walker (3½ h.p. Norton)
J. H. Mason (2¾ h.p. A.J.S.)
A. W. Thrush (3½ h.p. Triumph)
J. W Walton (3½ h.p. Rudge Multi)
C. Smethurst (3½ h.p. Norton)
T. C. de la Hay (3½ h.p. Sunbeam)
F. W. Corbett (2¾ h.p. A.J.S.)
A. Lindsay (3½ h.p. Norton)
J. L. Mitchell (2¾ h.p. A.J.S.)
O. Wade (2¾ h.p. A.J.S.)
W. Heaton (2¾ h.p. A.J.S.)
S. H. Giles (2¾ h.p. A.J.S.)
K. Hoblin (B.S.A.)

CLASS 4.—Solo machines, single or twin, unlimited capacity.

H. Petty (3½ h.p. Norton)
T. Simister (8 h.p. Dot)
T. Heath (6 h.p. Sunbeam)
S. T. de la Hay (3½ h.p. Sunbeam)
G. Dance (2¾ h.p. Sunbeam)
W. H. Butterfield (2¾ h.p. Levis)
H. Newey (2¾ h.p. Levis)

CLASS 4 *(Continued)*.

G. Brew (2½ h.p. New Imperial)
F. W. Corbett (2¾ h.p. A.J.S.)
A. Lindsay 3½ h.p. Norton)
S. O. Duck (2½ h.p. Metro)
W. T. Berry (Dot)
O. Wade (2¾ h.p. A.J.S.)
W. Heaton (2¾ h.p. A.J.S.)
S. H. Giles (2¾ h.p. A.J.S.)
K. Hoblin (B.S.A.)
W. Chinn (2½ h.p. Burnam)
G. E. Kuhn (2¼ h.p. Levis)
J. G. Orford (2½ h.p. New Imperial)
C. Lindall, jun. (1.9 h.p. Levis)
C. G Lambert (3½ h.p. Norton)
A. J. Berry (2½ h.p. Metro)

CLASS 5.—Sidecar machines, single or multi-cylinder, c.c. limit 600.

J. Smith (3½ h.p. Triumph)
J. R. O'Donovan (3½ h.p. Norton)
F. W. Corbett (2¾ h.p. A.J.S.)
W. Heaton (2¾ h.p. A.J.S.)
S H. Giles (2¾ h.p. A.J.S.)
J. Hoblin (B.S.A.)

CLASS 6.—Sidecar machines, any number of cylinders, c.c. unlimited.

T. Heath (6 h.p. Sunbeam)
W. H. Butterfield (Levis)
J. R. O'Donovan (3½ h.p. Norton)
F. W. Corbett (2¾ h.p. A.J.S.)
H. Bottom (6 h.p. Bradbury)
W. Heaton (2¾ h.p. A.J.S.)
F. W. Giles (2¾ h.p. A J S.)
J. Hoblin (B.S.A.)
A. Hankett (6 h.p. A.J.S.)

The Irish "End-to-end."

AT 4 a.m. on Tuesday last, competitors in the Irish End-to-end trial, promoted by the Ulster Centre of the M.C.U. of Ireland, started from Rock Island Coastguard Station. The trial extended over two days, 293 miles being covered on the first day and 213 on the second day (yesterday). Those who started were as follow :

F. M. Summerfield (2¼ h.p. New Hudson)
Lieut. V. J. Farrell (5 h.p. Indian)
W. J. Henderson (7-9 h.p. Harley-Davidson sc.)
W. J. Chambers (4¼ h.p. B.S.A. sc.)
R. S. Russell (2¾ h.p. Douglas)
J. Stewart (2¾ h.p. Douglas)
W. H. Butterfield (2¾ h.p. Levis)
H. Newey (2¾ h.p. Levis)
T. Woods (4¼ h.p. B.S.A.)
"Sou' Wester" (2¾ h.p. Douglas)
J. Doleman (3½ h.p. Rover)
J. Browne (3½ h.p. Rover)
E. J. Jack (3½ h.p. Rover)
T. Toole (4¼ h.p. B.S.A.)
C. B. Franklin (7 h.p. Indian sc.)
J. Dwyer (4 h.p. Triumph)
T. W. Ladd (6 Bradbury sc.)
A. W. Mooney (6 Bradbury sc.)
R. Jones (4¼ h.p. B.S.A.)
F. L. Dooly (4¼ h.p. B.S.A.)

Open Trial in Ireland.

AN open reliability trial of a somewhat novel character was run off on Saturday last under the auspices of the Dublin and District Motor Cycle Club. It was rather unfortunate that the date selected for the event came so close to the End-to-end of Ireland trial.

The route was arranged by Mr. Reuben J. Dodd, who presented the prizes for the event, and was not made public prior to the start. On assembling at Inchicore Bridge the competitors were told to proceed towards Carlow as far as Kilgowan, under the usual competition conditions. Arriving there each was handed a skeleton map and told to proceed to Poulaphuca by the route indicated thereon. The route took the competitors over a series of byroads south and east of Dunlavin and back to the town, and by further by-roads to the finish at Poulaphuca.

It was necessary to maintain the scheduled speed of twenty miles over the mapped part of the course, and several secret checks were taken to ensure its observance. In addition to this penalties were enforced against anyone using instructions regarding the route from outsiders.

The following competitors completed the course :

J. F. A. Day (2¼ h.p. Sun)
O. Roche (3½ h.p. Rover)
J. Paisley (6 h.p. Bradbury sc.)
R. Grimes (5 h.p. Indian)
G. A. M. Curtis (7-9 h.p. Indian sc.)
P. H. Hulse (4¼ h.p. B.S.A. sc.)
C. S. Kettle (4¼ h.p. B.S.A. sc.)

A motor machine gun battery complete and ready to take the road or field.

An All-khaki Race Meeting at Brooklands.

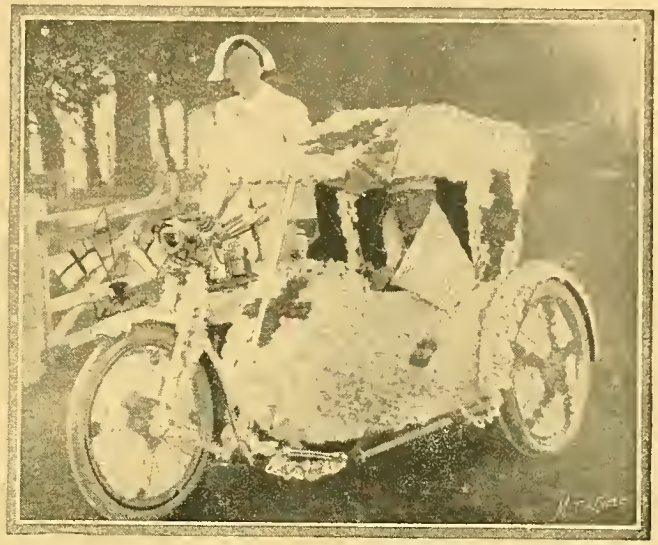
IN our issue of July 1st (page 13) we mentioned that an officer motor cyclist had suggested that it might be possible to get up some races at Brooklands for the many officers now quartered in and around Aldershot and the district in which Brooklands is situated. We have been into the matter with Mr. Kenneth L. Skinner, secretary of the B.A.R.C., and Colonel F. Lindsay Lloyd, both of whom have offered to lend their assistance.

It is known, of course, that the track is not in a sufficiently good condition to allow of races taking place throughout its whole length, but the railway straight is in quite good order, and some short sprint races might be held. A few gymkhana events and a hill-climb up the test hill could also be included.

It is suggested that there should be an entrance fee of 2s. 6d., and that all officers and men who come as spectators should be charged 1s. entrance fee, this to recompense the B.A.R.C. in some little way for letting the meeting have the use of the track free of charge. A small committee of well-known motor cyclists would take charge of the organisation. Saturday, July 31st, has been suggested as the date.

At the present time the general public are not admitted to the track, but it is open to members of the B.A.R.C. and B.M.C.R.C., while, of course, no objection could be raised to the meeting being attended by officers and men in uniform.

Perhaps some of the signal centres in different parts of the country would care to send competitors. All those who care to compete are asked to communicate at once with the Editor, *The Motor Cycle*, 20, Tudor Street, E.C. We think the idea quite a good one, as there is a distinct novelty about an event in which all the competitors would be wearing the King's uniform.



A decorated Triumph sidecar outfit, awarded first prize at a carnival in aid of a Belgian fund held at Timaru, New Zealand. The owner—"wounded" in the sidecar—is Mr. A. E. Dendy, at one time trials secretary of the West Essex A.C., and in the early days a rider of a Centaur. Mrs. Dendy is driving.

A Dutch Inter-club Reliability Run.

AN inter-club run known as the Three Provinces Trip was held in Holland on June 27th under the auspices of the Noord Nederlandsche Motor Club, the Ned. Motorwielryders Ver., and the Friesche Motor Club. Much interest was shown, especially by motor cyclists. In Class A (light machines) fourteen riders took part; in Class B (heavy motor cycles) twelve; in Class C (motor cycles with sidecars) five.

The whole road was divided as follows: First stretch, 41 km., time allowed 1h. 40m.; second stretch, 40 km., time 2h. 5m.; third stretch, 55 km., time 1h. 50m.; fourth stretch, 30 km., 1h. 5m.; fifth stretch, 56 km., time 1h. 50m. The start and finish were at Groningen. Results:

Some of the competitors—a Harley-Davidson sidecar outfit leading.

CLASS A.

		Marks lost.
1.	James (1-cyl.), silver gilt medal	0
2.	Douglas (2-cyl.), silver medal	1
3.	Douglas (2-cyl.), silver medal	2
4.	F.N. (1-cyl.), silver medal	4

CLASS B.

1.	Wanderer (2-cyl.), silver gilt medal	0
	F.N. (4-cyl.), silver gilt medal	0
3.	Simplex (4-cyl.), silver medal	1
4.	Pope (2-cyl.), silver medal	3
5.	Rudge (1-cyl.), silver medal	10
6.	F.N. (4-cyl.), remembrance medal	24

The run was through interesting and beautiful scenery in the provinces of Groningen, Drente, and Friesland. The trip may seem rather complicated, as there were different roads for motors, motor cycles, and motor cycles with sidecars. Everything was, however, arranged excellently, all participants receiving a clear description of the roads, and a good map, also the controls were worked well, so that the whole thing went off without a hitch. The weather being very fine most of the riders were back at Groningen by seven o'clock. An excursion to Giethoorn, a picturesque village, had been made the day before, and the proceedings finished with a pleasant dinner

A Visit to an R.E. Signal Station.

THE scene was a house labelled "To Let" in a small country town; in fact, it was more of a cottage than a house. Being to let, it was taken over by the War Office and handed over to the R.E. Signal Service, who swept and garnished it, and made it habitable. It had a nice courtyard and a lean-to shed, which our French Allies would have called an *abri*, and in this there were sixteen Douglases and one Triumph. Many of the former were of the new W.D. pattern, being fitted with stronger frames, new back fork ends and larger weatherproof hubs, while the belt rims were not only attached to the rims by means of short spokes, but were clipped on to the main spokes. These latter

(Upper) A group of despatch riders outside the signal station referred to in the accompanying article. With the exception of one Triumph, all the machines are Douglases.
(Circle) Some of the men in the telegraph office.
(Lower) The shed in which the motor cycles are stored. The sergeant in the foreground is one of the many men who have come from distant parts of the Empire Overseas in the Mother Country's hour of need.

A Visit to an R.E. Signal Station.—

were of a much stouter type than is ordinarily met with on these machines. Every machine had a large box on the carrier which was intended to take the necessary spares and the rider's personal belongings.

There was room for a workshop, but this had not been fitted up, as the workshop equipment is not served out till the D.R.'s are sent on active service. The men were quite ready to go to the Front, as they had had their training at a big D.R. centre.

The Officers' Quarters.

In the front room, parlour, or whatever one may call it, was the officers' mess room, which was very plainly furnished, while, of course, the luxury of an ante-room was denied them. In the hall there was a rifle rack in which there were several of the new short Lee-Enfield rifles. These were for the guard, as the D.R.'s are armed with revolvers.

Upstairs was the officers' bedroom. In this there were two camp beds and one mattress on the floor, which was occupied by our friend at whose invitation we came down. Being a hardened soldier who had been through Mons, Landrecies, Le Cateau, the Marne, the Aisne, and Flanders, he scorned the luxurious bed, and nightly rested his weary limbs on the mattress in a "flea-bag"; but he scored over the others as he had purchased a real chair and a genuine washstand, the only luxuries of this kind in the room. Next to this was a small room, stocked with the implements of the sartorial art. One of the D.R.'s had been a tailor by profession, and he was made to ply his trade to some good purpose, as he was as skilful with the needle as on his doughty Douglas.

A few doors up the street was the signal office, rigged up in a similar dwelling. In the front room were telegraph instruments and telephones, the air lines being ingeniously led in through a board above the open window. The field telegraph and field telephone have reached a high degree of perfection, but air lines may be cut, also lines running along the ground may be cut or damaged by shell fire. Then comes the despatch rider's chance, for it is on him that Headquarters have to depend for getting through the all-important message. The layman little realises that he is a swifter and surer means of sending a message than flag-wagging, and his despatch cannot be read by the enemy unless he is actually captured, and even when this happens it may cause the enemy some trouble to find it. How many thousand times has the motor cyclist D.R.'s work been proved to be of inestimable value, and how often has his pluck, skill, and doggedness saved the lives of our brave men?

It is interesting to note that in this small station the D.R. and Air Line officers were each provided with Singer light cars, though of these the former still retained his motor bicycle as well. The D.R.'s were mostly North-country men, and were most expert riders. Our officer friend was a proud man when we left him, as there had been an inspection that morning, and most people had been called over the coals, but the D.R.'s and their machines had been praised for their smart appearance.

The Four-cylinder Motor Cycle.

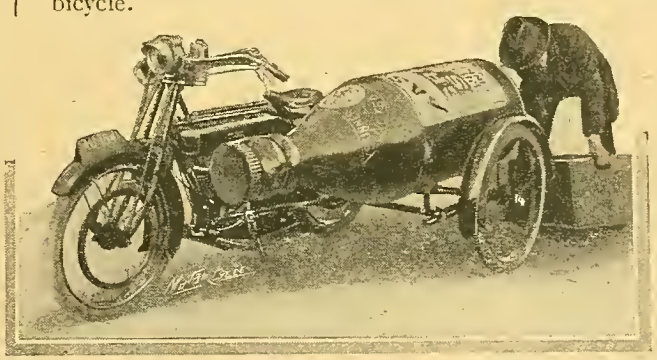
By JOHN ARMSTRONG.

THE development of the motor cycle has been attended by a continuous, if gradual, advance in many directions, and in none more so than that of the engine. With the exception, however, of the Belgian-made F.N. and the American Henderson machines, the majority of mounts are still provided with either vertical single or V twin-cylindered motors, while the English Douglas is one of the few cycles having a two-cylinder horizontal engine.

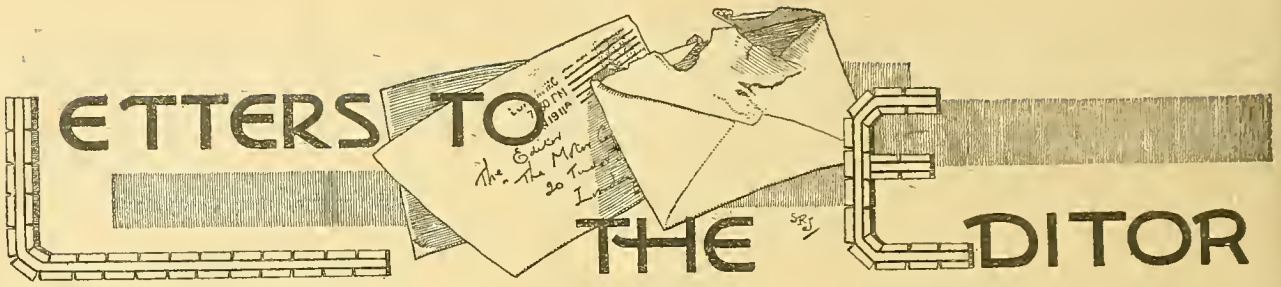
In the early days of the movement the direct driving horizontal four-cylinder Holden motor bicycle was unique, and it was followed later by such machines as the four-cylinder Binks and the transverse vertical double-cylindered Princeps. Now there is no question that to obtain the most superior torque, not to mention several other subordinate but important advantages, a four-cylinder engine is desirable. Now the difficulty would appear to rest with securing a sufficiently compact motor, but I suggest that the obstacle is purely an imaginary one. In a word, where more than one cylinder is required it is at present the custom to use a diagonal twin-cylinder motor.

There exist, in my opinion, no objections whatever to immediate improvement along that line by constructing a four-cylinder V engine. Such a motor could be made to occupy little, if any, more width, and certainly no greater height, than the usual V-twin engine; and it possesses this great advantage, that it could easily be arranged to drive through a propeller-shaft or a belt. This proposal obliges no alteration in the general design of the machine, and, while a large bore engine could be utilised for special requirements, it would be found quite enough, and perfectly satisfactory, to have four small diameter cylinders of a size no larger than the Belgian and American cycles already referred to.

This idea is well worthy of special attention by the astute British manufacturer. Such a device would dispense at a bound with the noise and irregularity inseparable from the single and twin-cylindered motor bicycle.



The advertising value of a sidecarrier is strikingly illustrated by this picture of a Lea-Francis outfit used by Messrs. Skinner and Rook, a Nottingham firm of wholesale bottlers of "Bass." It has been in daily use since early last year, and it has covered 20,000 miles. The body was designed and fitted by Messrs. Bennetts, of Nottingham.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Riding Hints.

Sir,—In reply to "K 9582" in a recent issue of *The Motor Cycle*, I ride a 2 h.p. O.K., and always run down hills a mile or more long in neutral, and run the machine till it is about to stop, then put in the low gear, and the engine fires at once. I may say I have done this for a year, and have found no bad results. H.G.C.

Useless Brakes.

Sir,—Has it, I wonder, ever struck the manufacturing world of motor cycles that probably the most ridiculous and inadequate fitting to a cycle is the hand brake? Even your staid old motor cyclist of 60 summers *will* go a mile or two over the limit occasionally; then why not provide him with the means of stopping in a few yards, should the need arise?

I venture to say that 50% of the accidents would be averted by the using of more powerful brakes. We know the carefulness of motorists in general, and how they always ascertain that a main road is clear before branching on to it from a side road. There is no reason why the front brake should not be dispensed with, and two powerful foot brakes fitted, acting on the rear wheel. Hand brakes are suitable for lightweight machines and lightweight riders, but for nothing heavier. L.G.S.

Despatch Riders' Work.

Sir,—I notice in your issue dated June 24th a letter written by Corporal O'Connor, in which he lays great stress on the dangers attending the duties of a motor cyclist despatch rider at the Front.

Corporal O'Connor begins by saying that he is "somewhere in the firing line of Flanders." I hope his fair and impressionable readers realise that, even if Corporal O'Connor is in the habit of writing from the firing line, other despatch riders do not—and should not.

The general rule for despatch riders is that brigade headquarters is about the nearest they should go to the firing line, in all ordinary circumstances. And it is a foolhardy brigade headquarters which plants itself nearer than 1,000 yards from the said firing line. The brigade with which I am stationed is certainly no nearer, and, like Corporal O'Connor's, is subject to a good deal of shell fire. In fact, it is also hit quite frequently by rifle bullets. Also, the roads from my headquarters to my divisional headquarters are for some distance in full view of the enemy. Like Corporal O'Connor, I also "encounter more shells in one day than the average man at home would care to dream of in a year." But that is not saying a great deal, for I do not imagine the average man at home cares to dream of even one tiny little "whizz-bang" in a year, or even any number of years. I do not wish to draw comparisons between Corporal O'Connor's hairbreadth escapes and my own little experiences, but I should like to say that there is nothing left of any of the houses in my little village, and the church (half a mile behind us) does not disappear bit by bit; it sat down in a heap one day under my own rather startled eyes.

What risks have to be run by despatch riders attached to a cavalry division I know not, but I can and do say that Corporal O'Connor's phrase is quite correct. It is only in exceptional cases that a despatch rider attached to an infantry brigade runs any very big risks. Of course, I have known despatch riders, some of them friends of mine, get wounded or even killed. But these cases are not very frequent, and are generally attributable either to sheer bad luck (such as a stray bullet or a shell fired at venture) or else to their own foolishness. If some five months with a brigade, nearly always under shell fire, and if a period of five weeks in one of the stiffest bits of fighting on the British front during last April and May, entitle me to speak with any authority on this subject of danger, then I should like to say that, generally speaking, a despatch rider never encounters such real danger that he is justified in writing home such letters as the one in question, so calculated to disturb and cause needless anxiety to the parents and friends of despatch riders.

In conclusion, may I enquire if Corporal O'Connor is attached to one of the new formations so recently arrived out here, and if he yet knows the meaning of the Army word "windy"? H. E. KEITH SAWTELL,
Corporal R.E.

Lady Motor Cyclists.

Sir,—I wish to answer "S.E.M.'s" letter. From my experience I should advise a 2¾ h.p. Douglas. I ride a man's model, but, of course, ladies' models are made by the Douglas Co. Personally, I cannot advise whether to start with sidecar or solo. Solo riding has so far been good enough for me.

As to breakdowns—well, if one is careful with a good machine (and has a fair run of luck), nothing very serious should happen. On the occasions on which I have ridden alone and had trouble with my machine I have always found fellow motor cyclists most sporting about helping.

I think every lady who rides would advise "S.E.M." to get a motor cycle; it is the greatest pastime going.
FRANKETTE.

The Advantages of a Petrol Strainer.

Sir,—The following may be of interest to riders of two-strokes with petroil lubrication. I had a good deal of trouble with the carburetter flooding and a choked petrol pipe, owing to a kind of fluff (presumably taken in with the oil). I have now fitted a B. and B. petrol strainer (price 3s. 6d.) in the petrol pipe, about 3in. from the tank. The result has been most satisfactory. I often run my 1914 Triumph Junior for 800 miles without touching the carburetter or filter. All that is required then is to unscrew the union nut of the filter, take out the gauze strainer, clean, and replace. This prevents any particles getting to the carburetter which can cause flooding. The running of the machine is more regular and the consumption lower. I average 100 miles to a gallon of mixture. I always use No. 1 petrol now. I found No. 2 carbonised much quicker. I can run my machine well over 1,000 miles without dismantling. When I do take the engine down I remove the piston and clean the inside well. As a rule I get more deposit there than on the top. I am inclined to think this is often overlooked, and causes many of the troubles riders complain of in the two-stroke. I have ridden my machine now well over 10,000 miles, and it is pulling quite as well as when new, if not better. I trust this may be of service to some readers of your delightful paper. TWO-STROKER.

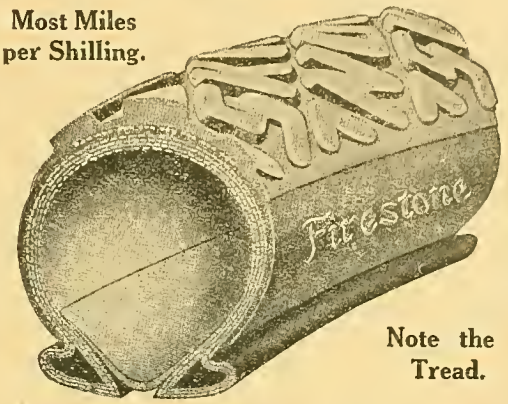
Firestone
TYRES

Most Miles per Shilling.



Note the Tread.

Stocked in Sizes to fit Indian, Harley-Davidson, and all American Standard Motor Cycles.

MORE powerful engines, higher speeds, and heavier sidecars make more and more severe demands upon tyres.

The Tyres which stand up longest under the new conditions, and deliver "most miles per shilling," are undoubtedly Firestones.

The Safety of your passengers, your machine, yourself, depends mainly upon your tyres. The scientific high-built, right-angled tread of the Firestone Non-Skid, carried out in non-slipping "live" rubber, makes it the only tyre for the man who puts safety first.

The Firestone makers have the largest output of any exclusive tyre and rim works in the world—a guarantee of satisfactory service.

Improving the Consumption on a Two-stroke.

Sir,—Perhaps you will allow me to thank the writer of the article which appeared some time ago on improving the consumption by fitting an arrangement made out of a valve from an inner tube and a needle to engage with the jet. I have tried the tip, and I may say the result was more than satisfactory. On my 1914 two-stroke I was unable to get more than 60 m.p.g. (petroil mixture). Wishing to be able to improve on this I fitted a home-made sight oiling arrangement, making the connection to the inlet tube, and found that while the engine got enough oil I could not get satisfactory running either as regards power or mileage, although I tried all sizes of jets, as at almost all except high speeds four-stroking continued. But what a change now. The Senspray, since it got the "needle," gives me about 120 m.p.g., sweeter running, apparently more power at all speeds, especially low; in fact, the result is such that I am looking forward to doing some decent runs this summer, whereas last year I was afraid to go far, seeing the tank is so small, without having a supply of petrol on the carrier, which is, in my opinion, not very suitable on a lightweight.

In conclusion, I wish again to express my appreciation of *The Motor Cycle*, which has saved me—a working man, whose hobby is his two-stroke—more money than I could very well afford to spend. N.B.

The Protection of Patents in Spain.

Sir,—I think it would prove of considerable benefit to British trade if you could do something to bring home to our inventors and manufacturers the need for protecting their patents and trade marks in this country. I am an Englishman, and am sole agent for many English firms.

Recently I had offered to me, at a lower price than I can buy in England, "Whittle" belting. I was offered by the same concern the "Dr. Low" acetylene generator. The house in question is Spanish, and the name is at your disposal if you wish to know it.

The "Dependence" tail lamp of Messrs. J. and R. Oldfield, Ltd., is also being imitated, and some time back I came across an imitation of one of the "Wood-Milne" productions. I was able to obtain the withdrawal of this from the market, although it has since reappeared under name of "Wood-Mild." In this case it was a question of "trade mark" only. As regards the "Dependence" tail lamp, I am taking the necessary steps, as agent of Messrs. Oldfield, to defend their interests.

It is hardly feasible that the instances I have brought to your notice above are the only ones, and that being so I am sure you will see the need for giving prominent warning to our inventors and manufacturers so that they can protect themselves against this despicable form of modern Spanish trading, which is calculated to rob them of the legitimate rewards of their brains and energy.

Barcelona, Spain. HARRY WALKER.

"Mac," the mascot of the Australian D.A.P., M.T., is photographed on a despatch rider's Rudge.

Overhead Valves.

Sir,—I have read with great interest many of the readers' opinions published in *The Motor Cycle*, and also the short articles by various designers. The things that interest me most in the latter are the advantages claimed by the overhead inlet valve, viz., better cooling of the exhaust valve and less "pocketing" of dead gas. This is, in my opinion, only going halfway. It would be far better to have the exhaust valve overhead. This would embody both the advantages of the overhead inlet, and also gain: (1.) A more direct flow for spent gas. (2.) The thick metal between the valve pocket and cylinder wall would be cooled by the fresh charge of gas, thus avoiding local distortion. The great drawback would be that the exhaust pipe would not find much favour. The change from the neat side port would no doubt disgust the average motor cyclist. Appearance must come before efficiency.

(Corpl.) S. ABRAM.

The £100 Car.

Sir,—I have read with much interest your article in *The Motor Cycle* of June 24th entitled "The £100 Car," and should like to criticise it a little.

Your remarks are to the effect that we have not a two-seater car on the market at that price, which is true to a certain extent. But what about cycle cars, which are very near to it?

Before mentioning the name of the one I am referring to, I should like to add that I am not pecuniarily interested in it. The car I refer to is the 8 h.p. Carden, with J.A.P. engine. This little car took two of us (a combined weight of 23 st.) up the Cornish hills in fine style, never once failing. I must admit that it is fitted with only a single seat body; but if this little runabout is capable of taking two people of average weight, why are the makers (whoever they may be) not enterprising enough to fit a two-seater body? The car, as it is, sells, I think, at about £70. For, say, £75 a two-seater car ought easily to be well within the reach of those who at present carry their passenger on the carrier of a motor cycle costing anywhere from £50 to £60, and you will notice the cost of such a car would be at least £20 cheaper than an average priced sidecar combination. The cost of upkeep is practically the same, the weight being divided among four (motor cycle) wheels instead of three.

WOULD B. ENTERPRISING.

The British Magneto Supply.

Sir,—The words that summed up the above-mentioned article do not do much credit to the patriotism of the British, although they are true.

I could only grasp from the reports of the various British magneto companies that their present output was as much as they could manage, and after the war they feared a complete loss of trade owing to cheap foreign lines.

Many motor cycle and cycle car manufacturers *will* fall back on foreign magnetos as soon as possible on account of the cheaper price; but it rests with the buyers of such machines whether these magnetos are patronised. If motorists when buying new machines were to insist that British magnetos should be supplied, the manufacturers would soon supply the desired article, and I am sure I am safe in saying that British magnetos are quite as good as, or even superior to, foreign ones. A decrease in the price could be looked for when the trade had established itself and when raw materials could be easily obtained.

Give the British magneto manufacturers a chance, and let us support and try their machines, and see if they gain fame, not only in our islands but also in the countries that supplied us in the past. C. B. HARLEY.

SUMMARY OF CORRESPONDENCE.

H. W. Allen writes, with reference to the climbing of Glengesh Hill, that his 3½ h.p. Sunbeam, "after being baulked at the first attempt, climbed the hill without apparent effort." He picked up his passenger above the second hairpin.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Driving from the Sidecar.

I should be very glad if you would tell me if one can be summoned for driving a motor cycle from the sidecar.—K.

We do not think you could be summoned for driving a motor cycle from the sidecar, especially if you could prove that in this position the machine is reasonably under control.

Motor Pacing.

I should be obliged if you would give me information as to the greatest distance ever travelled in one hour on a cycle behind motor pacing, giving date, man's name, and place where the record was put up. Will you please state the make of engine and h.p.?—H.C.O.

The hour motor-paced cycle record is held by Paul Guignard, and is 63 miles 255 yards. This record was made at Munich on September 10th, 1909. The pacing instrument used was a 16 h.p. twin built up specially by the racing man's mechanic from a conglomeration of oddments which could not be possibly designated any individual make.

A Cracked Exhaust Valve Seating.

The exhaust valve seating of my engine has developed a slight crack from top to bottom. Although up to the present this does not seem to have diminished the power very much, I should like a little advice on the matter, as to what is the best course to take. Is welding possible in this case, or will it necessitate a new cylinder? On releasing valves for grinding in last time, I found the exhaust valve very badly burnt. Do you consider the crack to be the cause of this? What I cannot understand is the fact that power and compression do not seem to be affected.—J.E.L.

As to whether welding is possible or not is a matter which can only be decided by the expert to whom you submit the cylinder. If the average welding expert will undertake the job, he will probably see it through satisfactorily, and will give you an estimate. The crack would account for the bad condition of the exhaust valve, and will ultimately result in loss of power. A crack of this kind is almost bound to spread, and when it does so you will soon lose compression and power.

Oval Piston Rings.

I have just had a new top ring made for the piston (which has had the groove skimmed out) of my 2¼ h.p. four-stroke. I had to file a considerable amount out of the gap before the ring would fit the cylinder. Now, when the engine runs, there is practically no compression. Everything else is in order, so I think this must point to ovality of the ring. Please advise.—B.S.B.

It is not improbable that you have filed considerably too much out of the gap of the piston ring. The space between the two ends of the ring when in the cylinder should permit of a $\frac{1}{100}$ feeler to be squeezed between them and no more. To test for ovality, fit a wooden handle for lapping-in the piston, mix some Richford's valve grinding paste and thin oil together, or very fine emery powder and oil, and apply on the piston and rings, insert the piston in the cylinder, and work it up and down the full length of the stroke with a turning movement. This operation will show where the ring is touching, and should be kept up until the ring beds home for its whole surface on the cylinder wall. After which the compression will improve with a short run on the road. Be very careful not to push the piston so far into the cylinder that the ring can expand in the cylinder head and lock the piston in this position.

Loss of Power.

I have trouble with a two-stroke machine, ten months old. I took the cylinder off, as I thought it was time it came off and had a clean out. I thoroughly cleaned the piston and rings, etc., and put them together again with a bit of packing between the cylinder and the crank case. It started up, but will only run on level ground, and requires the throttle wide open then. There is very little compression. I put some oil on the top of the piston, and it improved a little, but only for a time. The mixture of oil and petrol is just the same as usual. I have put the piston the right way in. The timing on the magneto has not slipped. Can you suggest the cause?—SECRETARY.

Examine and clean the carburetter. Check the magneto timing. When timing a two-stroke engine, bring the piston dead on top of the compression stroke, and couple up the sprocket to the armature spindle with the contact breaker fully retarded and the points just breaking on the steel segment. Examine the piston rings. If there is any doubt about the fit of a piston ring in the cylinder, scrap it; and when refitting the new ring set the gap at $\frac{1}{100}$th clearance. Also see that there is no carbon deposit in the piston grooves, and that the new rings may be easily rotated when fitted to the piston. A dead top piston ring on a two-stroke engine means no power. It would perhaps be as well to remove any packing from under the cylinder flange, and replace with a carefully cut thin brown paper washer, soaked in boiled linseed oil. Attention to the above will, we have no doubt, effect a marked improvement in the running of your two-stroke engine.

Uneven Running.

I should be greatly obliged if you would kindly advise me on the following: (1.) I have a rather old 3½ h.p. single-cylinder machine, and recently I noticed that when going up hill the firing became very sharp and loud, and the machine jerked at every explosion. This also happened when I dropped the exhaust valve after slowing down. The machine has, for the last two months, run very smoothly, and the cylinder is quite free from deposit. Could you please tell me the cause of this, and how I could remedy it? (2.) Would a 3½ h.p. machine fitted with a Mabon clutch pull a light wicker sidecar satisfactorily?—F.V.A.

(1.) It is not unlikely that the engine requires a general overhaul. Since the carbon deposit has been removed, it is only necessary to have the valves sand-blasted, the faces reground, new valve guides fitted in the cylinder, and the seatings retrued to the guide. Fit new and stronger valve springs, new piston rings. Drain out all the stale oil from the crank case, and flush out with paraffin. Afterwards inject three fresh charges of oil. Fit a new single-point plug of good make having heavy electrodes. Overhaul and clean the carburetter, check the ignition and valve timing, and trim up square the high tension carbon brush, and clean and readjust the magneto contact breaker points. (2.) The clutch in question would undoubtedly give satisfaction when fitted to a 3½ h.p. machine with a sidecar attached, but it is necessary to fit a two or three-speed gear to a machine if serious touring is contemplated with a sidecar attached.

Patching + Vulcanising are Obsolete!

TO MEND THAT PUNCTURE OR BURST TUBE

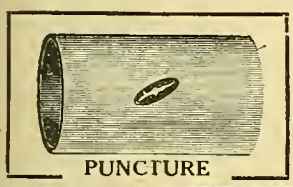
ONLY YOUR HANDS—
A FEW MINUTES—
AND A

Mustikon
"MUST-STICK-ON"

RUBBER
REPAIR
STUD

ARE NECESSARY.

BUT TO VULCANISE YOU NEED—
A VULCANISER, A REPAIR SHOP—
AND AT LEAST ONE HOUR'S WORK.



PUNCTURE

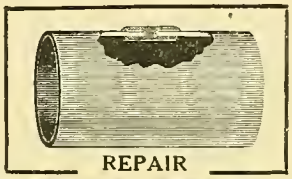
The "Mustikon" way permanently repairs your tube INSIDE, OUTSIDE & PLUGS UP THE HOLE. "Mustikon" repairs CANNOT CREEP, LEAK OR BLOW-OUT. NO METAL IS USED.

LIGHT CAR OUTFITS 10/6 each.
MOTOR CYCLE OUTFITS 5/9 each.

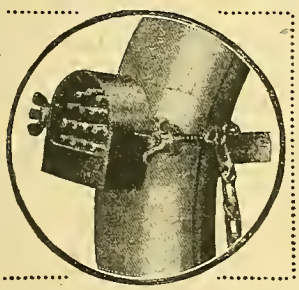
Obtainable from all dealers or from

MUSTIKON, LTD., 23, NEW STREET, CARDIFF.

As supplied to the British War Office, French and Russian Governments.



REPAIR



A Stitch in time saves nine

and a Simms Vulcaniser saves its moderate cost many times in one season, for with it you can repair the *worst* bursts and punctures without getting expert help.

SIMMS VULCANISER

is quite automatic; you can make a permanent repair the very first time you use it. You can't go wrong or injure the tyre. Don't buy new tyres; get a Simms Vulcaniser, and make your old ones equal to new.

Complete, ready for use, Motor Cycle size, 10/6

Petrol Blowing Back.

Would you be good enough to tell me the cause of the petrol blowing back at the carburetter? It is a great nuisance, and must be a waste of petrol. My machine is a single-cylinder with automatic valves.—J. McL.

The cause of the trouble is probably owing to too weak an inlet valve spring. You should, therefore, fit a stronger one, and also see that the lift is not too great. This should be approximately three thirty-seconds of an inch.

A Countershaft Pulley.

I am fitting a countershaft pulley to my free engine Rudge, and want to use the pedal bracket to carry the spindle. What would be the best type of bearings to fit? A ⅝in. spindle will be used. It has at present a steel bush right through mounted eccentrically on end plates. Can this be used, as it would be useful to adjust the chain from engine shaft? I am fitting a 7in. adjustable pulley. I presume this will be large enough to give good results. —F.W.

We are of the opinion that a suitable method of fixing a countershaft pulley to the machine would be to fit the countershaft spindle stationary in the bottom bracket and to mount the pulley and chain sprocket together on a ball bearing thereon, thereby retaining the eccentric adjustment for the driving chain. The pulley you propose fitting should prove quite large enough.

A Broken Cylinder and Piston.

Having cleaned the carbon deposit from the cylinder of a 1908 Triumph, I took the machine out for a trial run of about two miles. The machine went well, and nothing seemed wrong. About fifteen minutes after the trial run, and before the engine was cold, I went out again, and just as I had got into the saddle, about a distance of ten yards, there was a sharp crack, and the cylinder and piston broke in pieces. The cylinder broke about an inch above the four holding down nuts, and the piston just across at gudgeon pin. Nothing was amiss that I know about, and I did not prime the engine before starting. I should be obliged if you would give me any explanation for this breakage, and if there would be any likelihood of a similar occurrence when I get a new cylinder and piston fitted.—J.W.

The trouble is that when the machine was reassembled after having been decarbonised the holding down bolts were unevenly tightened. A good many breakages have arisen from this cause. The correct method of reassembling a cylinder is to screw up all the holding down nuts finger tight; then tighten each nut slightly in turn with a spanner, after which slacken off all the crank case bolts just a shade, and then finally tighten up diagonally all four cylinder nuts. The crank case bolts are then tightened up to a cylinder drawn down squarely and firmly on to the case, thus ensuring perfect alignment with no detrimental strains.

Gear Adjustment.

I shall be much obliged if you can help me with the following: The clutch of my Armstrong three-speed Mark II. gear refuses to be taken out, but everything else about it works perfectly. It was recently overhauled, and found in good condition and working order, but now I cannot get free engine since a new sliding push rod has been put in, which is quite free, but will not free the clutch. The old rod and bell crank are lost, but new ones are fitted exactly as the originals.—W.M.S.

We are of opinion that the new push rod is too short, and, consequently, does not free the clutch as it should do.

Bad Running against the Wind.

My machine climbs hills in excellent form, very often with two passengers besides myself, and I very seldom have to change gears, yet on the flat with the least head wind the engine begins to knock, and has no power to pick up. I may say my top gear is 5½ to 1.—C.B.

The symptoms described in your letter are certainly rather curious, as we should have imagined the engine would knock on hills if it did so with a head wind. Apparently the wind affects carburation to some extent. Have you tried closing the air a little and retarding the spark?

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.D.L." (Otley). — Omega, New Imperial, and Sun-Vitesse. Reliability, consumption, speed, and hill-climbing.

"H.F.C." (Leamington).—6 h.p. A.J.S. passenger outfit. Petrol consumption, tyre wear, and general reliability.

ROUTES.

FARNBOROUGH TO BLACKBURN VIA BROADWAY, avoiding towns; also mileage. —A.B.

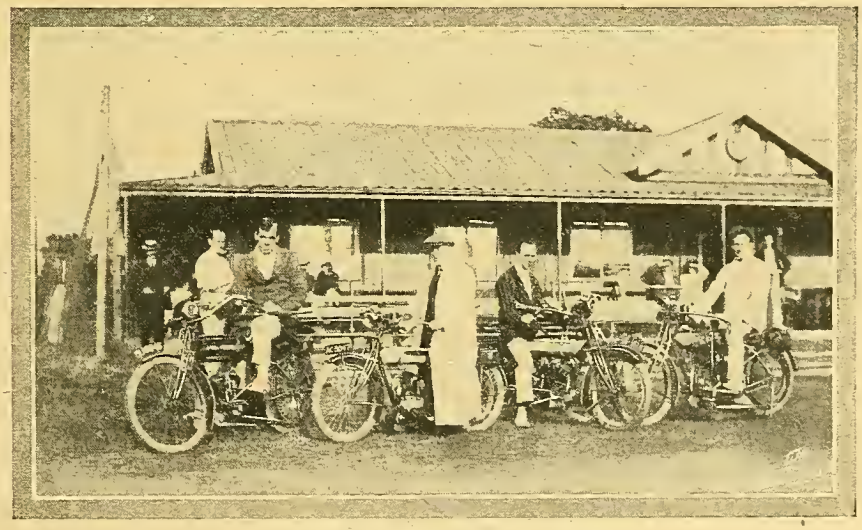
ILFORD TO LLANDUDNO.—H.G.R.

From Ilford follow "blue road" on R.A.C. Official Map of Recommended Routes Round London (obtainable from *The Motor Cycle* Offices, price 1s. 8d. post free), through Woodford Bridge, Woodford Green, Woodford Wells, Chase Side, Barnet, Elstree, Watford, Berkhampsted, Aylesbury, Bicester, Banbury, Stratford-on-Avon, Alcester, Kidderminster, Bridgnorth, Shrewsbury, Ellesmere, Overton, Wrexham, Mold, St. Asaph, Abergele, Colwyn Bay, to Llandudno.



MOTOR CYCLING TO TENNIS.

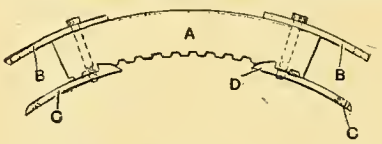
Many a motor cyclist uses his mount for running to and from the tennis courts. A number of motor cyclist engineers engaged on making munitions and other Government work find time for an hour or two on the courts to keep themselves fit.

PATENTS.

By ERIC W. WALFORD

A Belt Fastener.

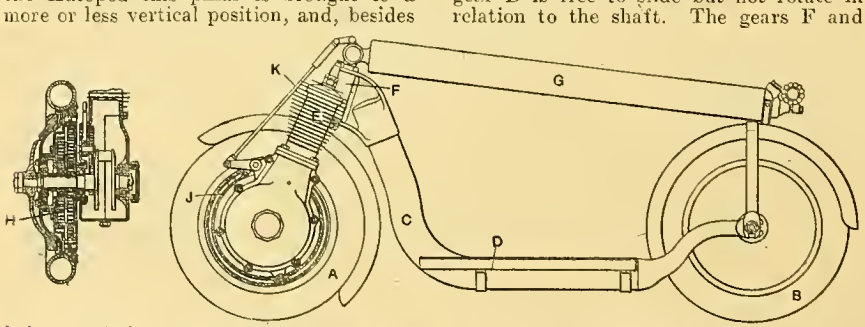
With the object of obviating the gap which exists between the belt ends when an ordinary fastener is used, this inventor proposes to employ a short length of belting A, to each end of which is secured top and bottom plates B and C. These plates are held in position by screws, and the ends of the belt to be joined are inserted between the plates and secured.



To permit of the belt curving round the pulleys the plates are formed with a curve, and for additional security projections D are formed on the lower plates to engage corresponding recesses in the belt length A.—T. R. Eaves and W. Miller, No. 14,396, 1914.

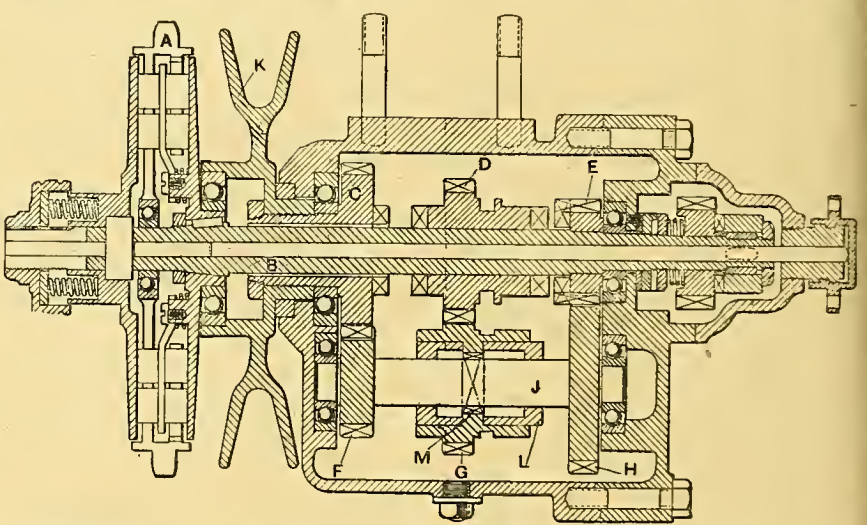
The Autoped.

The object of this interesting American innovation is stated to be "the provision of a new vehicle so totally different from other self-propelled vehicles as in many respects to take the place of walking, by affording a motor propelled platform on which a person usually will stand, although a seat may also be provided, and at the same time having a construction so compact, light, simple, and inexpensive to make and operate, that it will accomplish a purpose in the economic life of individuals which is not afforded by any self-propelled vehicle to-day," and so on. The wheels A and B are mounted upon a member C, which carries a footplate D. The front wheel A carries the engine E, and is steered about the pivot F. The pillar G is shown folded down out of use, but when it is desired to use the Autoped this pillar is brought to a more or less vertical position, and, besides being used for steering, it affords some lateral support to the rider. This pillar also is formed hollow to carry the fuel. Between the engine-shaft and the wheel hub is arranged an epicyclic reducing gear H, one member of which is acted upon by a brake band J connected by a rod K with the pillar G. This connection is such that by moving the pillar through a slight angle the engine may be caused to drive the wheel, a free engine provided, and finally a brake applied.—The Autoped Co. of America, No. 2,099, 1914.



The New Hudson Gear Box.

The chain wheel A is driven from the engine and communicates its motion to the gearshaft B through friction clutch mechanism. On the shaft B are mounted three spur gears C, D, E, which engage corresponding gears F, G, H, on a layshaft J. The spur gear C is formed with a sleeve to which is secured the belt pulley K. The gears C and E are normally free on the shaft, whilst the gear D is free to slide but not rotate in relation to the shaft. The gears F and H are fixed upon the layshaft, whilst the gear G is carried on a sleeve L which is provided with internal clutch teeth M so that the gear G may be clutched to the layshaft when required. The gears D and G are constantly in mesh and slide together, being moved by a double forked lever (not shown). On moving the central elements to the left the clutch dogs on the gear D engage those on the gear C, and the drive is direct. On moving the parts to the right, that is, into the position illustrated, the drive is from D to G through the clutch connection M to the layshaft and thence by the gears F and C. This is the second gear. The lowest gear is provided by moving the central members over to the right, so as to engage the right-hand dogs on the gear D with those on E. The drive is now doubly reduced through the gears EH and FC.—The New Hudson Cycle Co., Ltd., and T. A. Tisdell, No. 4,875, 1914.



A Rigid Frame Construction.

From the drawing it will be seen that the top tube A and front down tube B are duplicated and connected at the front to a single piece head C, affording a strong and substantial construction. At the rear the top tube members converge, and are joined to a dropped member D, allowing of a low saddle position.—W. A. Foster, No. 10,472, 1914.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

☞DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Experienced Men on Home Defence.

DURING our experiences in recruiting motor cyclists, we find that there is much discontent among practical men attached to home battalions, by reason of the fact that novices with little or no military experience are sent to the Front. We publish a letter in this issue which is typical of many we are constantly receiving, but which, unfortunately, we are unable to deal with. Another complaint is from men who have been on active service since the beginning of the war, and who as the months flit by see less and less chance of being sent to the Front. Some of the complaints come from men attached to foreign battalions, a number of which are on coast defence.

Now there is some reasonable ground for discontent among experienced men, many of whom have given their time, even previous to the outbreak of war, to making themselves proficient military motor cyclists, and yet are forestalled by men who possibly have only decided to join the Colours since Christmas. But the matter is too momentous to be considered individually. It would upset the whole army scheme were a reorganisation, as some suggest, to come into effect. In our brief experience as recruiting agents it has been only too clear to us that some men expect their personal preferences to have consideration. Many, for instance, specifically ask for positions on home defence; others go out of the way to enquire if they are likely to be in any point of danger at any time; others admit that they are too nervous to stand the racket of constant gun fire, yet on the other hand we have men on home defence bemoaning their fate that they cannot get to the Front. And these are the men, who, by reason of their willingness, nay keenness, are likely to make the best soldiers. It is obviously impossible to interrogate every soldier singly as to whether he would like to stay at home or go to the Front, and break up a battalion to form a foreign service regiment. Therefore, we appeal to those patriotic motor cyclists, sportsmen as they are, to bear their fate with equanimity, supported by the knowledge that they are serving their King and Country no matter where they chance to be.

Complete Motor Cycles.

A FEW years ago a campaign was launched in the English press on the desirability of marketing cars complete and ready for the road, *i.e.*, equipped with all the necessary adjuncts which it becomes a nuisance to the new owner to be continually providing. Of late it has been regular practice in the car world to supply vehicles fitted up complete with lamps, horn, tools, and all other necessary impedimenta for a tour of any length. Such a policy in connection with motor cycles has been urged in this journal on divers occasions, and a good number of firms have been quick enough to realise the wisdom of offering a completely equipped machine to a prospective buyer. But many manufacturers do not seem to realise that when a sale has been effected the owner is doubly thankful to have been relieved of the petty worries and expenses connected with selecting suitable articles for attachment to his machine. This is only natural, as accessories offered for sale are usually of standard design, and it is obvious that they cannot be applied to any make of mount with the same ease and grace, and the man who should know the best size, design, and shape of fittings to be applied to a machine is the designer of the machine itself. Why should a buyer have to disturb his front wheel to fit a speedometer, and scratch the plating by fitting a lamp and horn which ten to one do not fit without special padding? If manufacturers were to pay a little more attention to this recommendation of complete machines, they would be bound to benefit, and we should see less of the unsightly horns and lamps fitted in a place for which they were never intended and altogether out of proportion to the mount on which they are used.

An index to the advertisements in this issue will be found on the page facing the back cover.

RACING IN NEW ZEALAND.

Results of Recent Meetings in Various Parts of the Dominion.

Manawatu Motor Cycle Club.

THE Manawatu Club's race meeting was conducted at Woodville on April 28th, but rain curtailed the programme to three races, which resulted :

OPEN HANDICAP, FIVE MILES.—P. Coleman (7 Indian).

OPEN HANDICAP, SEVEN MILES.—Osgood (2¾ Douglas).

OPEN HANDICAP, TEN MILES.—R. Jones (2¾ Matchless).

Marton and Rangitikei Motor Cycle Sports Club.

The above-mentioned club held a race meeting at Marton on April 15th, when there was a large attendance of spectators. The events, which were run off on a grass track, resulted as follows :

NOVICE HANDICAP, FIVE MILES.—Franche (7 Indian).

OPEN HANDICAP, TEN MILES.—P. Coleman (7 Indian), scratch.

350 C.C. CHAMPIONSHIP, FIVE MILES.—J. Dawber (2¾ Douglas).

OPEN HANDICAP, FIFTEEN MILES.—P. Coleman (7 Indian).

LIGHTWEIGHT CHAMPIONSHIP, FIVE MILES.—J. Dawber (2¾ Douglas).

3½ H.P. CHAMPIONSHIP, TEN MILES.—R. Jones (3½ Rudge).

Times are not given, as it is stated that the times of some of the events were taken wrongly. In other respects the meeting was carried out very efficiently.

Wanganui Motor Cycling Club.

The Wanganui Club held a race meeting at Wanganui on April 22nd, when several events were run off. Results :

SIDECAR RACE, THREE MILES.—Townsend (6 Royal Enfield), scratch. Time, 5m. 16s.

PRIVATE OWNERS' HANDICAP, FIVE MILES.—Cunningham (7 Indian). Time, 6m. 49⅕s.

NOVICE HANDICAP, FIVE MILES.—V. Creswell (2¾ Douglas). Time, 8m. 49s.

OPEN HANDICAP, TEN MILES.—V. Creswell (2¾ Douglas). Time, 12m. 7⅗s.

LIGHTWEIGHT CHAMPIONSHIP, FIVE MILES.—Healey (2¼ New Hudson), 150s. Time, 7m. 14⅕s.

WANGANUI 3½ H.P. CHAMPIONSHIP, TEN MILES. — A. Anderson (3½ Triumph). Time, 10m. 52⅕s.

CONSOLATION HANDICAP.—Goldsmith (3½ Royal Ruby).

The surprise of the day was the winner of the Novice Handicap and the Ten Miles event—V. Creswell (2¾ Douglas). This rider was only sixteen years of age and these were his first races.

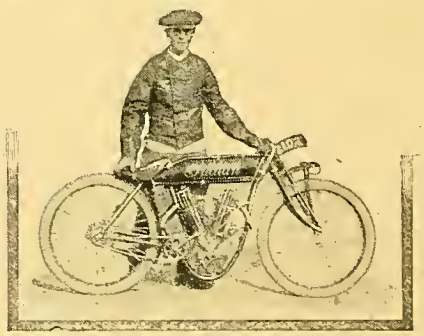
Napier Motor Cycle Club.

A very successful meeting was conducted by this club at Napier on Easter Monday on the racecourse, which was in good order and free from ruts. There was a large attendance, and the gathering was a decided success in every way. Results :

NOVICE HANDICAP, FIVE LAPS.—Limbrick (7 Indian), scratch. Time, 8m. 14⅗s.

OPEN HANDICAP, FIVE MILES.—R. Jones (2¾ Matchless), 65s. Time, 6m. 30s.

LIGHTWEIGHT CHAMPIONSHIP, FIVE MILES.—R. Jones (2¾ Matchless). Time, 6m.



Jack Booth, the Australian rider, whose name is nearly as familiar, by reason of his speed achievements, at home as in Australia where his records are made. His latest and best performance is that of covering half a mile on his 7 h.p. Indian at a speed of 83.33 m.p.h. This is claimed to be the fastest time ever achieved by any form of motor vehicle south of the Equator.

HANDICAP, TEN LAPS, FOR 4 H.P. AND UNDER.—A. Nash (2¾ Douglas), 200s. Time, 14m. 57s.

HEAVYWEIGHT HANDICAP, FIFTEEN MILES.—P. Coleman (7 Indian), scratch. Time, 15m. 42⅗s.

OPEN HANDICAP, FIFTEEN LAPS.—R. Jones (2¾ Matchless), 240s.

SIDECAR HANDICAP, TWO LAPS.—L. Limbrick (3½ B.S.A.), 10s. Time, 4m. 4s.

OPEN HANDICAP, EIGHT LAPS.—S. Mason (2¾ Douglas), 250s. Time, 12m. 11s.

SIDECAR HANDICAP, EIGHT LAPS.—Boag (7 Matchless), 60s. Time 14m. 8s.

3½ H.P. CHAMPIONSHIP, TEN MILES.—R. Jones (3½ Rudge). Time, 10m. 46s.

SIDECAR HANDICAP, FIVE LAPS.—Arnold (4¼ James). Time, 9m. 15s.

CONSOLATION HANDICAP, FIVE LAPS.—J. Boucher (3½ Rudge), 35s. Time, 7m. 26s.

The Pioneer Motor and Sports Club.

This club held two races on New Brighton Beach on May 22nd. Results :

OPEN HANDICAP, EIGHT MILES, SOLO.—G. Moffatt (3½ Triumph), 1m. Time, 8m. 27s. Fastest time was made by G. B. Brown (4 Triumph) in 8m. 25s.

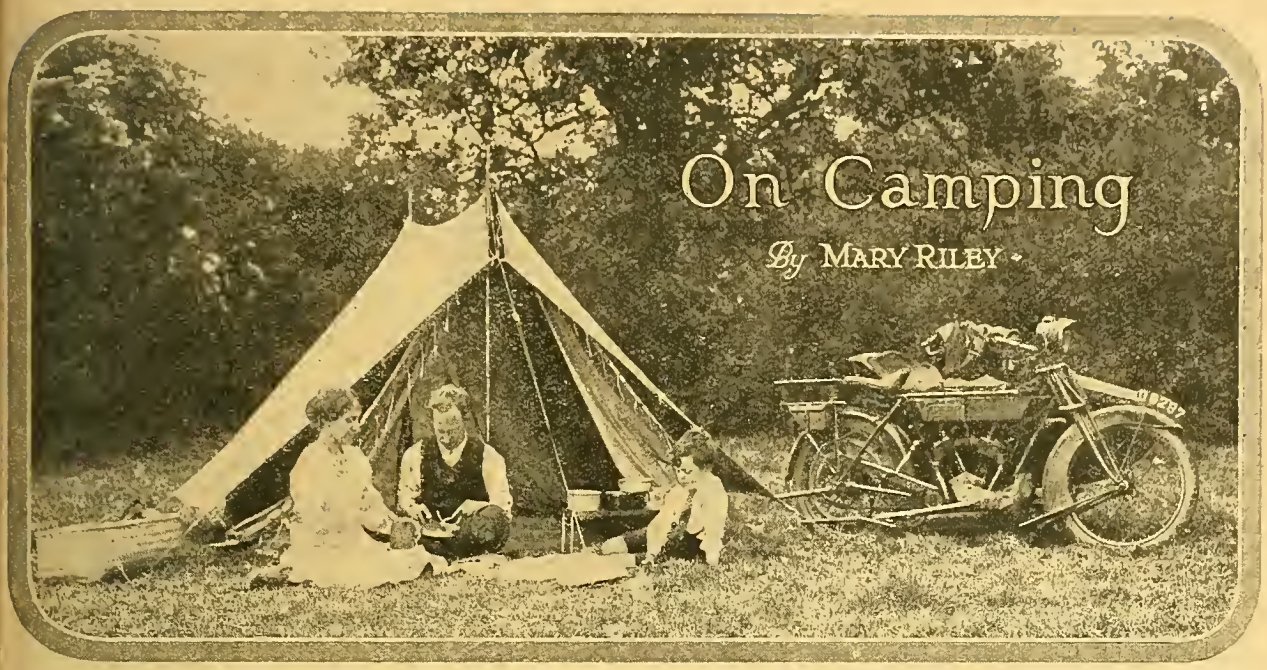
OPEN HANDICAP, SIXTEEN MILES, FOR SIDECAR.—F. Thomas (3½ B.S.A.), 2m.

Christchurch Riders aid Charity.

At a big carnival held at Christchurch during April in aid of the British and Belgian Relief Funds the Pioneer Motor and Sports Club held a tilting-at-the-ring event, which was won by A. Woodham (2¾ Douglas) in 17⅖s. Several decorated sidecar outfits took part in the procession and excited much admiration, a decorated Triumph outfit as a schooner coming in for particular mention. Several members of the club treated the public to short spins in their sidecars at sixpence a head, the proceeds being in aid of the fund.

HAMPSTEAD VOLUNTEER RESERVE.

MOTOR cyclists residing in Hampstead and neighbourhood, who being ineligible for military service have not yet been able to find scope for their patriotic energies, might do worse than place themselves and their machines at the disposal of the Hampstead Volunteer Reserve forming part of the Hampstead Battalion of the North London Volunteer Regiment. The corps has some 400 active members, and excellent headquarters at the Drill Hall, Hollybush Vale, opposite the Hampstead Tube Station. By permission of the Grand Duke Michael it makes use of the grounds of Kenwood for field practice, and the range of the Mansfield Rifle Club. Motor cyclists who are under nineteen years of age, or who, if of military age, can show sufficient reason for not enlisting in the regular forces, are invited to qualify themselves for assisting the corps in mobilising on emergency. Full particulars can be obtained from Adjutant Mr. Thomas Hancock Nunn, the Drill Hall, Hollybush Vale, Hampstead, N.W.



On Camping

By MARY RILEY.

THERE are many things to be considered with reference to camping, but the main requirements of the outfit are simplicity and lightness. Do not burden yourself with unnecessary luggage, have all cooking utensils made of aluminium, and to nest as far as possible. For instance, the plates and frying pan fit on to the bottom of the saucepans, while the saucepans in their turn nest into one another, and the Primus stove, being detachable, goes nicely into the top saucepan. The spanner for the stove also makes a handle for all the saucepans and frying pans. The enamel cups may have their handles sawn through at the bottom, which enables them to nest nicely, and enamel is much better for hot drinks, as aluminium holds the heat to a remarkable degree and burns one's mouth very easily. Do not carry a teapot—use an aluminium tea infuser and make your tea in the saucepan.

Sleeping Arrangements.

Many campers are lost to the sport because they do not understand how to sleep at night. The most miserable thing I know of in camp life is to be cold at night—it is impossible to sleep when cold—many people think if it is nice warm weather anything will do for covering at night time. This is a great mistake; you may make many shifts during the day, but you must have sufficient and proper clothing for the night. After ten years' experience we find sleeping bags made of pyreenese the warmest. Some campers do not undress, but this is a practice to be condemned—it is neither restful nor healthy. Undress and use a warm sleeping suit of light texture. Next get into your sleeping bag; a blanket and eider-down quilt for covering will, I think, be found quite enough. Be sure and have blanket and quilt well pegged down at the corners, then your partner will not rob you in the night. The quilt supplied by the Camping Club is made with a 12in. valance for that purpose.

If they follow out these suggestions I am sure intending campers will have restful nights (after the first one).

The whole outfit costs about £5, and may be purchased from the Amateur Camping Club, 4, New Union Street, Moorgate Street, London, E.C., or may be made by oneself. It is, however, advisable to join the club in any case.

Asking the farmer for permission to camp—a request readily granted. The picture incidentally shows how the complete kit is carried on the sidecar grid.

On Camping.—

The cost of the kit will not be excessive when one considers the pleasure derived from camping and the cheapness of it. It is possible to save the cost of the outfit on your first holiday. As an instance, my husband, little boy, and myself went for a camping tour in Scotland. We met with the greatest hospitality everywhere, but, unfortunately, we were one night late getting a suitable camp site, so decided we would get a bed if possible. This, with a plate of porridge each but no breakfast, cost us 10s. Now when you consider that charge and our ten day tour which cost us only £5, including petrol and lubricating oil, camping certainly shows to advantage.

When on tour we find no difficulty in packing the whole outfit for three people in a basket, which is strapped on the carrier of the Enfield combination. For a tour where clean clothes are necessary a smaller basket put lengthways in the sidecar makes a suitable seat for the boy, and is well away from all dust.

Our tent was designed by my husband and made by myself at a cost of 38s. It is 7ft. long, 5ft. 9in. high, and 6ft. wide, with 12in. eaves and 10in. porch at either end. These tents are very light; ours weighs 5 lb. It is necessary to pitch on the leeward side of the hedge, and always choose a good thick one.

The cuisine. Mrs. Riley is holding three plates, three frying pans, four saucepans, and a Primus stove. There is a milk can on her left arm, and wash basin and three-gallon bucket on the ground in front. At the back is the range, which keeps three pots boiling at the same time. The whole packs flat, and weighs very little indeed.

What to Avoid.

Remember not to pitch under trees. It is very nice in fine weather, but when it rains one gets all the droppings, which often keep one awake after the rain has ceased. And do not pitch in the same field as cattle for, if there is a horse grazing, no matter how large the field, he will want the bit of grass nearest the tent and he generally chooses the middle of the night in which to graze round about. Calves also are most inquisitive; they will come very cautiously up to your tent, look seriously at you with their big eyes, and if left alone will chew at the guy lines and uproot the pegs, and the whole thing will collapse. They are most persistent; no matter how many times you drive them away back they come, and you do not want to stay up all night driving cattle away. But the worst offenders are pigs. They neither eat the grass around nor go in one door and out the other as sane animals ought to, but go straight through the sides, tearing and spoiling everything.

Unwelcome Visitors.

Once I camped where they had litter at large on the farm. I had no doubts about those little pigs, and told the farmer so, but he said he did not think they would come near us. As we were going out for a short spin before lunch, I decided to leave both ends of the tent open, so that in the event of a visit they would go in one end and out the other if they chose. I carefully put all eatables in the baskets and closed them down. What I did not bargain for was that they first chewed the baskets away and got at all the food, and I can assure you they did not leave much, and their behaviour was truly pig fashion, for they went straight through the side of the tent, making a complete wreck of it, and on their way out found the soap and ate every bit (if lately the bacon of any motor cyclist has tasted

Afternoon callers—two varieties.

On Camping.—

not soapy he will now know the cause). They had gone when I got back, but they paid me another visit in the afternoon while I was resting. What fun those pigs had with me when I drove them away! They just squealed and careered around the field, coming back again and again.

To conclude, I must tell you a little story of what happened to some friends of ours. These friends had had a fixed camp all the summer, the husband going to business every day and returning at night. When they at last returned home late in the fall and slept in a bed, of course it was all very strange. The husband woke in the night and cautiously felt around: put his hand out of bed; he could not feel any ground. Then he woke his wife and whispered in a very low tone, "Maggie, dear, don't move; we have camped on the edge of a precipice."

The Simplest Form of Electric Lighting.

Low Candle Power Electric Head Lights from Primary Batteries.

THE production of an ample illumination from primary batteries in an electric head light of the low candle power variety, and its upkeep on an inexpensive basis, depend upon four main factors: The efficiency of the bulb and its power, the battery and its capacity, the actual type of the head light itself, and, in relation to the design of the lamp, the extent to which projection, focus, and reflection are utilised.

The power and the efficiency of the bulb constitute two of the chief agencies in the production of a brilliant light, and need to be considered closely in conjunction with the second factor, the battery capacity. As dry batteries of even heavy capacity are not capable of giving reasonably long life if the discharge rate exceeds 0.4 amp., it follows that a bulb for use with such a battery should have an efficiency at not more than one to one and a half watts. The well-known pocket lamp screw bulb of 2½, or 3½ volts, with the S-shaped metal filaments arranged at right angles to the plane of the bulb cap, consumes on an average approximately .25 to .3 amp., so that it is easily possible to obtain with these bulbs a light intensity of one candle power from a two-cell battery, and almost twice that intensity with a three-cell battery. For all ordinary purposes a bulb of this type in the 2½ volt .3 amp. series will, therefore, be quite suitable, and for night country riding the light from one of 3½ volts will be found ample if a suitable projecting lens is used.

Dry Batteries.

The necessity for keeping all accessories within limits somewhat restricts the capacity of a dry battery. Here it should be pointed out that, with the same current consumption, the greater the number of cells and higher electro-motive force, the stronger will be the current and greater the light, but the smaller will be the actual capacity. It is, therefore, desirable to use a battery with the least number of cells consistent with a sufficiency of light.

The small pocket lamp batteries are very useful as spares, etc., but otherwise are unsuitable.

Experience with several kinds of dry batteries has proved that, for all round excellence, those used for hand lamp refills are ideal for the purpose. Among these may be mentioned those of the Volex series and the somewhat larger Hellesen Flash. The writer had in use for over five months a 2½ volt Volex Rear-light battery, which gave about 70-75 hours' light before becoming exhausted. In the 4-volt class of the same size is the Volex Handy, but having three cells its capacity is somewhat less, although it is capable of generating a stronger current. The Hellesen Flash and the Volex Giant and Aero are of still heavier capacity, but when fresh, and where there is much vibration, they should be used with a strong (preferably 4-4½ volt) bulb.

Focussing the Beam.

The actual design of the head light is to a great extent in the hands of the manufacturer, and is practically limited to the types placed on the market. The construction of a good lamp, however, should embody perfect insulation in respect of the machine and lamp, good projection and focus, and should allow for as much reflecting surface as is possible to obtain for its size. A very successful experiment was that in which an old oil lamp of the King of the Road pattern was employed. The reflector was replaced by a china screw lamp holder, fixed so that the plane of the bulb filaments was vertical, and the wick holder was removed to allow of a small vulcanite switch-board, on a rubber plug, being inserted in the oil well. The switch was thus invisible, and the point of illumination was found to be in correct focus with the lens—one of the ordinary double convex form common in these lamps.

The body of the lamp itself can be made to form its own reflector, if parabolic in shape, and will, to a great extent, act as a projector. In some cases advantage can be obtained by enamelling the inside of the lamp a glossy white, but, whatever be the form, a good clear front lens is a distinct improvement on the front of plain glass.

Focus is entirely a matter for experiment, so that it is extremely useful to have some ready form of adjusting the focus. It should be remembered that the nearer the point of illumination to the focus of the lens, the longer and narrower will be the ray of light produced, and *vice versâ*. Care should be taken to ensure that the light is fixed exactly in the focal plane of the lens, *i.e.*, in a line with the centre of its thickest part.

A good waterproof conductor, enabling the battery to be carried anywhere on the machine, can be quickly made by stripping a piece of ordinary flexible insulated electric light cable of its silk covering; and the portion of the battery case which is touched by the terminals can be lined with a piece of old cycle tyre, which will materially assist in the prevention of leakage through wet.

H.W.H.

Quality in Two-strokes.

I remarked some months ago that the quality of various makes of baby two-strokes differs more than the general public suspect, and hinted that a trial run of two or three fancied makes was essential as a preliminary to purchase in this class, unless very reliable evidence can first be secured from a friend. I have owned and driven a good many brands, and not long ago I tumbled into a pitfall, and bought a dud. Its principal defects were violent vibration, ascribable in equal proportions to an ill-balanced engine and a badly designed frame, and rapid wear of the engine bushes, due to a crude oiling system.

Slow Running on Free Engine.

The huge popularity of the sidecar and the universality of free engines and variable gears have led the average motor cyclist to feel a little dissatisfied with the slow running of his engine. Whereas a car engine can be throttled down to tick over without vibration or noise when the vehicle is stationary, the slowest speed of the average motor cycle engine is distinctly on the high side; it is accompanied by a good deal of noise and not a little vibration, the result being that riders do not run their machine on free engine for a second longer than is inevitable. In part, this slow running coarseness is intentional on the part of responsible designers. They realise that, if a single-cylinder motor cycle engine could ape the running of a Rolls-Royce on free engine, users would let the engine run for five minutes at a time, and that this usage would be disastrous for an air-cooled engine fitted to a stationary machine. In part, too, the motor cycle approximates rather to the sporting or semi-racing type of car engine than to the roadster type; it is designed for a very high power output in proportion to its cubical capacity, and there is a consequent sacrifice of refinement; the engines of the majority of sporting cars cannot run very smoothly, inaudibly, or slowly, when throttled down.

The Future.

Nevertheless, we are entering a new era in the history of the sport and industry. Only a small percentage of modern owners clamour for super-efficient engines; the general public want a refined engine of medium efficiency and great durability, depending on an emergency bottom gear ratio for stunt hill-climbs, and they neither desire nor expect 60 m.p.h. all out on top gear. Moreover, riders are becoming more intelligent. Only a fool is likely to run an air-cooled engine with the machine stationary for more than a moment or two, and, if the fool is still with us, he is in the minority, and the trade can at last afford to deal faithfully with him and charge him for repairs necessitated by his criminal idiocy. So the slow running problem can be tackled. It is intolerable that the starting-up of our engines should annoy everybody within 200 yards: that we shoul have to hustle with red and shamed faces to scrambl aboard and get the noxious disturber of the peac removed from the locality as swiftly as possible. have a vision. I see the air-cooled sidecar outfit o say, 1917 A.D. It has a proper automobile carbu etter, equipped with a wee auxiliary vaporiser—ca it pilot jet, by-pass, or what you will—on which th engine ticks over at less than 100 r.p.m. It is s excellently balanced that the engine can run wit perfect steadiness at this speed—perhaps there ar two horizontally-opposed cylinders and an externa flywheel of large diameter. It is sufficiently we silenced to prevent the exhaust of the whiffs of ga inhaled *via* the pilot jet from resounding thunderousl over a tenth part of the area of the town; I do no mean that it is silenced to death, for a good sportin car will run silently on its pilot jet with an absolute open exhaust, provided the clearance passages ar large enough. It is accurately lubricated, so that even at very low engine speeds, oil films are main tained throughout the engine. It has improve cooling, possibly by the use of Harcourt radiators As a consequence of these advances, the starting up of a sidecar engine creates no more excitemen in a public street than the pull-up of the starting-handl of a six-cylinder car; people do not stop, stand, an stare for a quarter of a mile in each direction; n windows are flung up by nervous spinsters; no childre rush tearfully to their mammies. The rider does no blush and scramble. He dons his gloves in leisurel fashion, and eventually mounts the saddle withou creating the impression that he is a public nuisanc detected in an ungentlemanly action.

Fixed Carburetter Adjustments.

During the current year I have received compara tively few complaints of bad delivery tune; when suc letters have been received they have usually ha reference to the carburetter setting. I think the trad is now spending more pains on this very vita adjustment. Until the last year or so it was stupidl taken for granted that all the engines of a batch wer identical, and that perfect carburetter adjustmen could be attained by selecting a given size of jet an choke tube (if any) for all the carburetters. It wa a silly notion, for the trade was well aware that ever now and then the bench tester or a road tester woul send word in to the running shed manager, "Engin No. 9697 is a particular hot 'un: may we fit anothe to Mr. X——'s machine, and keep 9697 for the T.T or the Six Days," as the case might be; and the olde hands can hardly have forgotten how one or two firm measured the 2¾ h.p. De Dion with micromete gauges, analysed most of its parts, and unblushingl copied it as closely as they could without procurin the same efficiency. A vital element in the varyin

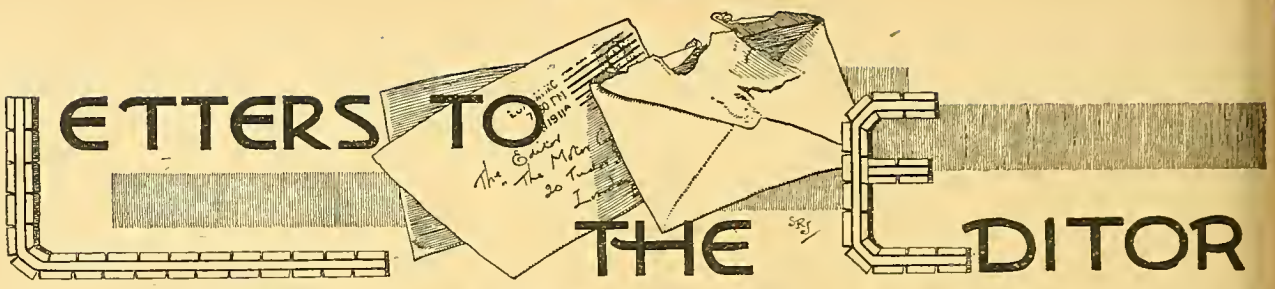
ccasional Comments.—

fficiency of apparently similar engines is the degree f air leakage past the valve stems; and there are any other details in which "must go" and "must ot go" gauges permit slight variations. Maximum nd minimum gauges are not always used on the repe- ition parts turned out by the thousand for carbu- etters: even when they are used, divergences are in- vitable. The sum total of all these minute diver- encies in engines and in carburetters suffices to render standard jet size, choke tube size, and petrol level bsolutely unsatisfactory; so the modern maker mploys the personal factor, and instructs his road esters to put the finishing touches to the setting by ctual experiment on the roads surrounding the fac- ory (less frequently, the bench testers essay the job). Here he is up against a fresh difficulty. Expert esters were not numerous in peace time, and the ream of that noble army is now in Flanders. So the rivate user can hardly wonder if the carburetter djustment of his new machine is not always supremely erfect.

Toolbag Sizes.

I believe the time has come for manufacturers to ncrease the size of their toolbags a little. I know ny friends are rather inclined to jeer at the amount f kit I carry—"what's your latest pantechnicon?" s a salutation my cronies often hurl at me; but, as a ournalist on whose shoulders the report of an event nay often hang, I must make sure of getting there, nd so I never stint my outfit. As our machines be- ome more complex they gradually clamour for a arger stock of spares. Last week, for example, I ondered which of two machines should carry me ver a 750 miles jaunt, and I was unwilling to strap nore kit on to the carrier than was inevitable; it is lways desirable to squeeze the mechanical outfit into the pannier bags, leaving the carrier top free for lug- gage. I began operations on machine No. 1. The offside pannier only just held the tool roll. Into the near pannier I wished to compress a tyre repair outfit, two spare plugs, a spare chain, spare bulbs for the head and tail lamps, one exhaust valve complete, and about ¼lb. of assorted bits, dictated by past experi- ence of the machine's nut-shedding propensities (this is no extravagant insurance against hold-ups with a three-chain twin); but, of course, they wouldn't go in. I had to house the chain, the bulbs, and the valve amongst my pyjamas on top of the carrier, and whenever I ride this machine light I have to choose between jamming these impedimenta in my pockets, or tying them on to the carrier. The case of the other machine is even worse, as its construction compels the driver to carry two or three extra tools and odds and ends in addition to the kit outlined above. Nobody likes carrying a few spares wrapped up in brown paper and tied with string on to various parts of the machine; but the only alternative is to wear out the lining of one's pockets, or to carry a carrier case of absurdly large dimensions as an economy on buying two carrier cases, one for luggage and bits, the other for bits only, according to the nature of a projected ride. It may be questioned whether the standard pannier bags were ever large enough for a prudent rider's needs on long-distance work, but now that spare chains (which must be carried under cover) and electric bulbs (which must be stored in bulky wooden cases) have been added to our impedimenta, the aver- age pannier is quite absurdly too small. I am willing to hang a coiled belt on the carrier stays, and to lash the spare inner tube round the handle-bar, but I draw the line at carrying 3ft. of Hans Renold as a watch chain, or at floating my spare bulb case in the petrol tank.

Start at Groningen of the Dutch trial described on page 65 of our last issue.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A Partly Open Cut-out.

Sir,—Perhaps you will allow me to warn motor cyclists to be very careful in the East Riding of Yorkshire. I was recently fined there (with a dozen or so others) for having a cut-out on a 1912 Singer. This cut-out was partly open and had no control attached. It had been like this ever since I had had the machine, and I had never been warned before, so you see that the machine could not have been unduly noisy.

J. BACKHOUSE.

Single v. Twin.

Sir,—I have read your very excellent paper for some years now, and during the last two or three years I have noticed in it many contributions and much correspondence derogatory to the 3½ h.p. single and praising the small twin. In the year 1913 many people predicted the 3½ h.p. single would be dead in two or three years. The sweeping victory in the 1914 T.T. race, both Junior and Senior classes, however, gave a fillip to its jaded popularity, and the War Office decree against the twin set people thinking.

Having ridden nothing else but small twins and two-strokes for the past three years, I decided to try a 3½ h.p. single this year, and I must say it has been a revelation to me. My machine is a 1915 3½ h.p. Norton single gear of 3 15/16 to 1, and the way it glides along at 28 m.p.h. without any fuss or effort has to be experienced to be appreciated. I can get the engine running regularly down to 4 m.p.h., and have done 73 m.p.h. on the level without any alteration or adjustment.

As for acceleration, the small twin accelerates well on low gear, but on top gear, accelerating from a speed of, say, 15 m.p.h., I easily beat a friend of mine who rides a 3½ h.p. T.T. twin of well-known make geared 5 to 1.

From a point of view of long life, the slow speed 3½ h.p. single must be better than the high-speed twin.

I have no connection with the Norton motors except the bonds of satisfaction, and enclose my card. R.E.B.

Motor Volunteers.

Sir,—Doubtless there are many motor cyclists who, like myself, have read of the splendid work being done by the Motor Volunteers, but are themselves unable to join, due to the lack of a suitable corps

With the organisation at present existing in the many district Volunteer Training Corps it should not be a difficult matter to form a motor squadron, provided a sufficient number of motorists express their willingness to join.

With this object in view, I should be pleased to hear from any motorists in Dulwich, Streatham, Tooting, or any other neighbouring district willing to be enrolled, and if a sufficient number is forthcoming, I would undertake the necessary arrangements for attachment to one of the local volunteer units.

It must be remembered that Volunteer Training Corps exist only for those who give a valid reason for not enlisting, such as (1) age, (2) Government contracts, (3) Government or municipal employment where permission is refused, (4) physical disabilities which would involve rejection by the Army, (5) where enlistment would involve serious dislocation of business, and throw men out of employment. There are other genuine reasons which cannot be classified, and if a man has a genuine reason he need not hesitate to come forward and give it. If the reason is good and valid the commandant will accept it. J. BENNETT.

[Letters addressed c/o the Editor will be forwarded.—Ed.]

A Curious Loss of Power.

Sir,—An experience of loss of power which my machine recently experienced, and its remedy, may interest others.

The machine, which is furnished with a reducing gear, commenced to fail gradually, so that it became more and more necessary to engage the low gear in order to surmount a hill or travel against the wind. All the customary investigations were made, to no purpose. Timing, compression, carburation, connections, valves, belt, and silencer were all examined; the piston and cylinder were cleaned, the bell-crank lever fibre levelled, and the platinum points filed. Still the machine would not climb a hill right out.

At last it was noticed that the platinum points separated with a sort of double motion not smartly, as they ought. So the magneto (an Eisemann) was removed, the armature taken out, and the cam filed to a sharper lift. Result: The power was completely restored. Reason: Wear through dust—a gradual process, taking many months. W.L.B.

Does an Engine Run Better at Dusk?

Sir,—Perhaps, in company with many of your readers, you may have observed that, at dusk and thereabout, motors and motor cycles appear to gain in speed and power, although the setting of the throttle and spark remains the same as previously.

An explanation of this might be forthcoming due to the fact that plants, flowers, etc., give out at dusk a considerable quantity of carbonic acid gas, this being sufficient to augment the speed and power of the motor referred to.

I have reason to believe that an experiment was carried out, by a private individual, in connection with this. It was as follows: A cylinder of the gas was attached in front of the carburetter, in such a position as to allow a lead from the cylinder to inject the gas into the air inlet of the carburetter. The engine was that of a motor cycle in the usual running order. The machine was started and run in the usual way, and after a short interval the gas was turned on. Coincident with this an increase of speed was noticed, the control levers remaining untouched. G.P.G.K.

A Motor Cyclist's Duties.

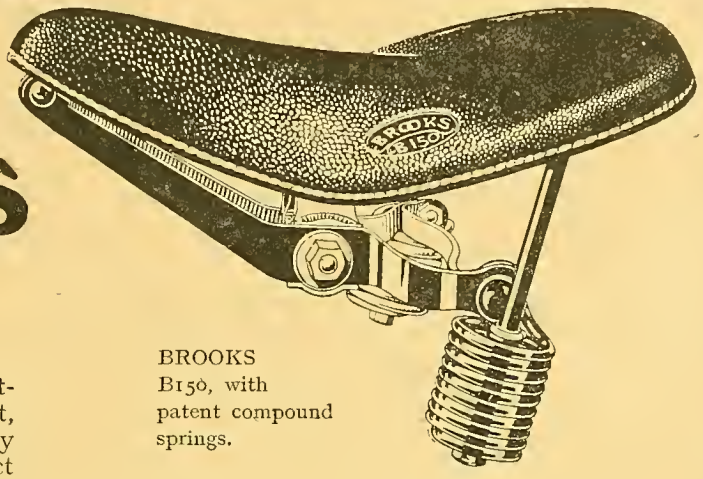
Sir,—A letter under this heading in your issue dated July 8th from Mr. John Hibberd disgusts me, and, I hope, all right thinking people, in no small manner. Presumably his son is aware that he is now a soldier, and a soldier is expected to do what is required of him, and to do it willingly, especially at a time like this, when every man ought to surrender himself unconditionally for service to his country. Where then can complaint arise when he is asked temporarily to perform his duties on a push cycle instead of on a motor cycle? And is not Mr. Hibberd *ashamed* to air a grievance so comparatively slight as that? When his son comes to France (or the Dardanelles, or anywhere where he may encounter active service) he will find many stranger duties expected of him than the one his father deems so "unjust."

I am indignant, because it shows there are some few men at home who still seem to lack the right spirit, without which we shall be unable to conclude the war satisfactorily.

Nor am I speaking in ignorance of a motor cyclist's duties at the Front, since I happen to have been despatch riding for eleven months with one of the first four divisions which landed in France the third week in August, and my work has by no means always been associated with a motor bicycle, or to my own advantage and enjoyment. Please, therefore, forgive my indignation. SERGT. 28056, R.E.

You riders of Lightweights—

you cannot afford to overlook the saddle question—it is also the question of your comfort.



BROOKS B150, with patent compound springs.

BROOKS B150

has been designed especially for lightweight machines. It is light, neat, compact, and, at the same time, roomy and beautifully sprung. Also, its perfect finish makes it an addition to any machine.

In answering these advertisements it is desirable to mention "The Motor Cycle."

The Cost of Running a Motor Cycle.

Sir,—Having been a constant reader of your valuable paper for the last three years, I am sending you particulars of my expenses during 1914 of my 1912 free engine Triumph, which I bought for £32 in November, 1913. The machine has been ridden solely by myself up to the middle of August, 1914, when I parted with it. I have ridden it 2,554 miles solo and 940 miles with a passenger on the carrier. These expenses have been accurately kept, and I have not left anything out. The running costs were as follow:

Total mileage covered = 3,494. Total expenses = £14 5s. 7d. Running costs per mile = .980d.

Petrol, 20 gallons	£1	13	4
Benzole, 21 gallons	1	7	5
Oil (lubricating), 2¼ gallons...		10	1
Carbide		3	0
Repairs to engine and machine	1	11	11
Lamp (second-hand)	1	0	0
Tyres (two) and tube	3	7	6
Sundries	1	2	4
Registration, licence, and revenue ...	1	10	0
Depreciation	2	0	0
Total	£14	5	7

The original belt that was on the machine when I bought it stood the whole time. It was a 1in. Dunlop. I have ridden many hundreds of miles on the canvas, and have not had the slightest trouble with belt slip.

I had two new tyres—a Hutchinson (Brooklands) tyre and a Clincher (Dreadnought) tyre—and one Dunlop tube. I have had £30 for machine in part payment for a new one, so this accounts for the depreciation being so small.

The petrol consumption is rather high, owing to using the machine for carrier riding, this type of passenger carrying being quite safe when the roads are dry, but not advisable when wet and slimy. The average petrol consumption was about 85 m.p.g.

BERTRAM WESTALL.

How to get to the Front.

Sir,—I should be greatly obliged if any of your military readers can inform me what steps I can take to obtain a commission in the A.S.C. (M.T.). [Apply to the Secretary, War Office, Whitehall, S.W.—Ed.]

I am at present a lance-corporal motor cyclist in a "foreign service" cyclist battalion now on coast defence. I was serving with this battalion some considerable time prior to the outbreak of war, and therefore it hardly seems fair to me that experienced men who gave their time and often money in peace-time to make themselves efficient military motor cyclists should be passed over whilst novices with little or no military experience are sent to the Front.

Transfers, I am informed, cannot be obtained unless one is willing to waive all claims as to the particular branch of the service one desires, otherwise getting into the R.E. or A.S.C. as a despatch rider would satisfy me.

I understand that motor cyclists under motor cyclist officers are used as convoys in the A.S.C. (M.T.); is this correct? If so, that is the commission I desire.

OILCAN.

[This letter from a lance-corporal is typical of dozens we are constantly receiving. The main grievance is that soldiers are kept at home whilst others, less experienced, are soon sent to the Front. We deal with the subject editorially.—Ed.]

Despatch Riders' Work.

Sir,—I have read in last week's issue of *The Motor Cycle* the letter from Corporal Sawtell in reply to the letter from Corporal O'Connor. As one of the first men to join the despatch riders at the very beginning of the war, and as one who has trained nearly every man who has gone out from Aldershot, may I say how sorry I am to read Corporal Sawtell's letter. I think that his letter might have ended in a much pleasanter manner than using the Army slang word "windy." I take it that Corporal O'Connor would not have written as he did unless he had good grounds for doing so. Surely our letters to *The Motor Cycle* are for the benefit of its readers, to let them know how things are at the Front, and not to court publicity. Therefore, let us by all means try and help each other, and not pull each other to pieces. There is a nice way of disagreeing with our friends besides being personal.

F. C. SCHOFIELD, Sergeant R.E.

Stone Throwing.

Sir,—I notice that an old pastime is being revived in some places on the Southend Road. It is that indulged in by small children, and consists in throwing stones at passing motorists.

These children wait at the roadside and take deliberate aim at passing motor cycles and cars, evidently secure in the belief that, no matter what damage may result, the motorist will not stop. When I see a suspicious look of anticipation on the faces of children as they watch me approach, I make it a point to slow down and fix my eye on them until I have passed. This usually has the desired effect, but in one case a girl of perhaps six or seven years took deliberate and expert aim, striking the tank amidships. I was going at about 8 m.p.h. at the time, and you may be sure it did not take long to pull up. On asking the child her name and address, the only reply was, "Don't know, sir!" "Where do you live?" I next asked. "That way, sir!" and she deliberately pointed in the opposite direction to where her home was, as I discovered on questioning some other children who came up. I sternly cautioned her not to be caught again, and intimated that a summons would follow in due course. She got frightened, burst into tears, and ran away—in the opposite direction to where she lived. The artfulness of it!

However, I am of opinion that if all motorists, car as well as cycle, were to make a point of stopping on being aimed at, whether hit or not, these petty offenders would soon realise that the foundation of their security—the belief that the motorist will not trouble to stop—is a false one, and the nuisance would pass away.

FRANCIS G. L. EVANS.

[A Number of Interesting Letters are unavoidably held over.—Ed.]

MIDLAND MOTOR CYCLISTS' VOLUNTEERS.
An outpost party reconnoitring.

"THE MOTOR CYCLE" RECRUITING SECTION.

More Men Wanted for the New Motor Machine Gun Batteries now being Formed.

RECRUITING for the new batteries of the Motor Machine Gun Service is proceeding satisfactorily. Among the recruits attested in Coventry last week are the following:

R. Hughes (Stamford).
E. W. Davis (Gravelly Hill).
P. Moss (Coventry).
H. Whaley (Wigan).
E. D. L. Walton (North Muskham, near Newark).
W. H. Scurlock (Pembroke Dock).
S. Cogan (Newington, Hull).
H. Barlow (Pelsey, near Chesterfield).
H. J. Edwards (Mossat, Aberdeenshire).
C. Green (Coventry).
B. G. Cook (Harrogate).
C. G. Richardson (Ashbourne).
A. J. Squire (Weston-super-Mare).
D. T. Jones (Bloomsbury).
A. D. Emsley (Salford).
R. McFadden (Bexhill-on-Sea).
W. Naylor (Bacup).
S. J. Conder (Cambridge).

More motor cyclists are required, preferably with sidecar experience, and a limited number of expert cyclists of good physique can also be accepted. An inspection is held in Coventry every Wednesday afternoon at the Recruiting Office, Masonic Buildings. Those accepted are billeted out for the night and leave for their training centre by first train on Thursday.

Candidates living at a distance will receive a free railway warrant to attend the next inspection on application to Mr. Geoffrey Smith, Editor, *The Motor Cycle*, 19, Hertford Street, Coventry.

Over fifty readers had notified Mr. Smith of their intention to attend the inspection yesterday (Wednesday).

It is not known how long recruiting will remain open. Naturally, there is a limited accommodation at the training centre, and when a sufficient number of men have been obtained recruiting will cease until the War Office sanctions the formation of further batteries.

5-6 h.p. Clyno and 6 h.p. Enfield sidecars are the machines in use at present. Other new patterns are constantly being tested.

A certain number of experienced motor cycle workshop mechanics and car drivers at 6s. per day are also wanted at the moment. Two references should accompany applications for these positions. The makes of cars used vary, but the present type is the 20 h.p. Studebaker.

We paid a visit to the training camp last week and found training proceeding briskly. The men looked very fit. Some were busy flag-signalling, others dissecting machine guns to get thoroughly acquainted with their mechanism, whilst others were enjoying the somewhat novel experience of being taught to drive a sidecar. There are a number of Scotch cyclists in training who have never handled a motor cycle previously. We found one or two of them wanted more than their fair share of the road. They proved very willing pupils, however.

How to Join.

The general particulars for service in the M.M.G.S. are as under:

AGE.—19 to 38.

HEIGHT.—Not important so long as applicant is physically sound and well developed.

CHEST MEASUREMENT.—Expanded bare, 34¼in. for age 19.

ENLISTMENT.—For duration of war.

EYESIGHT.—Glasses do not necessarily debar men from service, provided they can see quite well with them.

PAY.—1s. 2½d. per day; all found; usual separation allowance.

Readers who cut out and fill in the form below will, provided that the particulars are in order, receive a free railway warrant to attend the next inspection in Coventry.

HIGH SPEEDS AT STYLE COP.

Wolverhampton M.C.C. Open Hill-climb in aid of the British Red Cross Society.

STYLE COP was the scene of considerable animation on the afternoon of Saturday last, when the Wolverhampton M.C.C. held their annual open hill-climb there and ran off seven classes, each being divided into two sections—A, expert; B, general (or expert barred). Mr. A. E. Ryder, the trials hon. sec., officiated as chief marshal, Mr. J. Urry as timekeeper, while the judges included Mr. Alfred Bird, M.P., president of the club, and other names well-known in motor cycling circles. The programme was carried out without hitch until the last event, but the intervals were often unnecessarily long, and the competition occupied nearly five hours.

The hill is found by taking the Hednesford Road from Rugeley for rather more than a mile, and then turning to the left. Viewed from the road the hill appears to be steeper than it really is. The gradient was said to be 1 in 8, but this is, we think, an exaggeration. The rise is very gradual for the first half and the surface perfect; it then becomes slightly steeper and rougher, and towards the close of the meeting was a little loose in places, but always good. Style Cop is surmounted by a beech coppice, thick with bracken as high as a man's head, and the view is very fine in all directions. In the south-east the three spires of Lichfield Cathedral were clearly visible, to the north was Rugeley with its fine church spire, while in front to the west lay the broad expanse of Cannock Chase.

The morning broke wet after a very stormy night, but the rain blew off later, and the afternoon turned out bright and pleasant, with a very strong wind blowing up the hill, which was of assistance to the competitors, but very much the reverse to those who had charge of the timing sheets.

The Competition.

With the help of the following wind the times were for the most part very good; in fact, the gradient was as nothing to the more powerful machines. The fastest time of the day was made by T. Simister (8 Dot-Jap), whose speed was not much less than 60 m.p.h.; but perhaps the most remarkable performance was that of J. E. Greenwood, whose Sunbeam, fitted with a 4 h.p. single-cylinder engine, 85 × 105 mm. bore and stroke (596 c.c.), accomplished the climb with a sidecar and passenger in less than one minute, or at a speed of something like 45 m.p.h., and it must be noted that the times were taken from a standing start. The formula used was that recommended by *The Motor Cycle*, $\frac{C \times t^2}{W}$ (smallest figure wins).

CLASS I. (one or two cylinders not exceeding 300 c.c.)—This class proved a veritable triumph for the Levis two-stroke machines, which showed a wonderful turn of speed, and swept the board in both sections, though W. Chinn (2½ Burman) also did well. The awards were on formula. Results:

Other pictures of the Style Cop Hill-climb will be found on the centre pages (86 and 87) of this issue.

	Time. m. s.
A—1. H. Newey (2¼ Levis, 60×70)	1 8.6
2. C. Tindall, jun. (1.9 Levis, 60×70)	1 12
3. W. Butterfield (2¼ Levis, 60×70)	1 12.6
B—1. W. Butterfield (Levis)	1 8.8
2. C. Tindall, jun. (Levis)	1 11.8
3. G. E. Kuhn (Levis)	1 9.2

CLASS II. (one or two cylinders not exceeding 350 c.c.)—The times in this class showed a marked improvement in comparison with Class I, but the engines were larger and the following wind had become stronger. In the expert section the A.J.S. carried all before it, but the Sunbeam made fastest time in the general section. As H. Newey (2¾ Levis) came up, it was seen that he was keeping his right leg well away from the machine, and that a spray of petrol was issuing from the tank. This was caused by the petrol union having come unsoldered from the bottom of the tank. It was rather curious that he was able under the circumstances to reach the summit at all. Awards on time and formula. Results:

A—TIME.	secs.
1. F. H. Giles (2¾ A.J.S., 74×81)	52.2
2. W. Heaton (2¾ A.J.S., 74×81)	54
3. G. Dance (2¾ Sunbeam, 75×79)	54.4
B—TIME.	secs.
1. G. Dance (2¾ Sunbeam, 75×79)	54.4
2. N. Heath (2½ A.J.S., 66½×86)	58.2
3. J. H. Mason (2¾ A.J.S., 74×81)	61

CLASS III. (one and two cylinders not exceeding 500 c.c.)—The times in this class were very consistent, only one rider exceeding the minute, while 52s. was the fastest time recorded. Awards on time and formula. Results:

A—TIME.	secs.
1. C. Smethurst (3½ Norton, 79×100)	52
2. J. L. Mitchell (2¾ A.J.S., 74×81)	52.4
3. G. Dance (2¾ Sunbeam, 75×79)	53
B—TIME.	
1. G. Dance (3½ Sunbeam, 85×88)	53c.
2. H. Petty (3½ Norton, 79×100)	53.2
3. G. Dance (2¾ Sunbeam, 75×79)	54.2

W. Heaton (2¾ h.p. A.J.S.), second on time and third on formula in Class II.

Besides those mentioned, W. Heaton (2¾ A.J.S.), Lieut. A. Lindsay (3½ Norton), who came from Farnborough for the climb, H. Petty (3½ Norton), K. Holden (3½ B.S.A.), J. Smith (3½ Triumph), T. Slingsby (3½ Norton), and Gooding (3½ Brough) rode well. The speed of the 2¾ machines was remarkable.

CLASS IV. (one or more cylinders unlimited capacity).—The fastest time of the day was, as might have been expected, made in this class. T. Simister (8 Dot-Jap) in his first attempt in the expert section was timed at 47.6s., but he had to cut out for a moment near the top of the hill because two spectators crossed the road at this instant. His second ascent was made in 45s., which is said to equal the record for the hill. Awards on time and formula. Results:

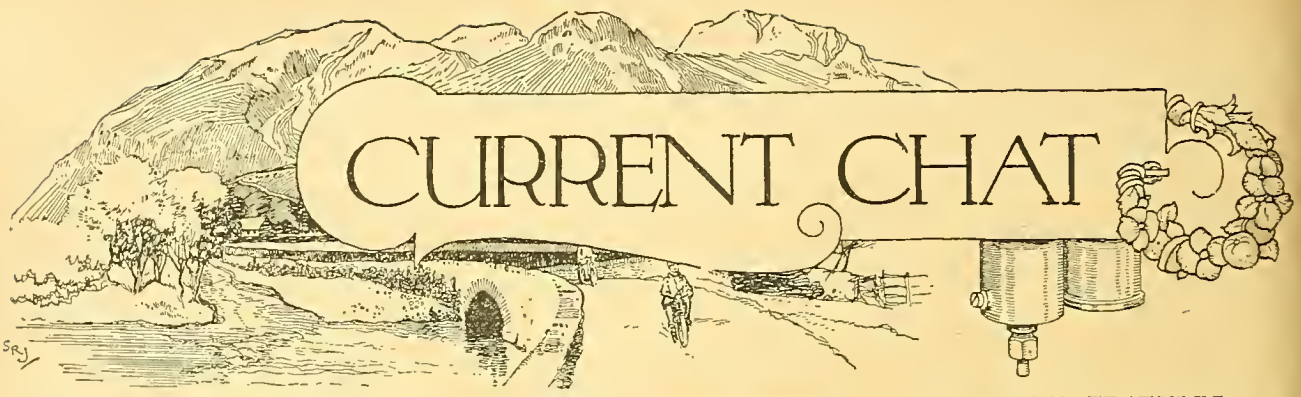
A—TIME.	secs.
1. T. Simister (8 Dot-Jap, 90×77½)	47.6
2. T. Heath (6 Sunbeam, 76×85)	49.8
3. W. Heaton (2¾ A.J.S., 74×81)	25.8
B—TIME.	secs.
1. T. Simister (8 Dot-Jap, 90×77½)	45
2. — Gooding (3½ Brough, 70×64½)	33
3. {H. Petty (3½ Norton, 79×100) / W. Dance (2¾ Sunbeam, 75×79}	

CLASS V. (sidecars not exceeding 600 c.c. Adult passengers). CLASS VI. (sidecars unlimited capacity).—The two sidecar classes were remarkable for the performance of the new big single Sunbeam, already mentioned, which made fastest time in each class. Another new machine to do well was the horizontal twin-cylinder two-stroke Levis driven by W. H. Butterfield, but the speed of the sidecar machines generally was very good.

In CLASS V. the awards were on time and formula; in CLASS VI. on time only. Results:

CLASS V. A—TIME.	m. s.
1. J. E. Greenwood (4 Sunbeam, 85×105)	1 0.2
2. D. R. O'Donovan (3½ Norton, 79×100)	1 2
3. W. Heaton (2¾ A.J.S., 74×81)	1 5.6
B—TIME.	m. s.
1. J. Smith (3½ Triumph, 85×88) (the only competitor)	1 10
CLASS VI. A—TIME.	
1. J. E. Greenwood (4 Sunbeam, 85×105)	58.8
2. T. Heath (6 Sunbeam, 76×85)	1 0.8
3. D. R. O'Donovan (3½ Norton, 79×100)	1 2.8
B—TIME.	
1. W. H. Butterfield (Levis, 75×79)	1 6
2. A. Haskett (6 A.J.S., 74×87) (the only competitors)	1 43.4

CLASS VII. (cycle cars, A.C.U. definition).—There were but two competitors in this class, and, owing to a mistake of the officials, only one of these, H. R. S. Birkin (G. P. Morgan), was timed. He ascended the hill in 1m. 48.6s. H. W. Wolverson, also driving a Morgan, seemed to us to be considerably faster, and we understand that he will lodge a protest.



TIMES TO LIGHT LAMPS.

July 22	...	...	9.2 p.m.
,, 24	...	...	8.59 ,,
,, 26	...	...	8.57 ,,
,, 28	...	...	8.54 ,,

Firms and the War Loan.

We notice that the Shell motor spirit interests have subscribed £500,000 to the War Loan.

The Second-hand Market.

The demand for good second-hand motor cycles is as pronounced as ever, and with the continued shortage of new British-made machines, second-hands are likely to continue to fetch good prices.

Motor Cyclist Officers.

The number of officers who are motor cyclists is amazing. One meets them whatever route is chosen. Even on the stations one frequently sees an officer followed by a porter wheeling a motor cycle and another with baggage.

All-khaki Racing at Brooklands.

Arrangements are now completed for the officer motor cyclists' race meeting to be held on the Brooklands track, and the programme and other details will be found on page 91 of this issue. The meeting will be held on Saturday, August 7th.

Demonstrations by the Motor Machine Gun Service.

There is a possibility of one of the motor machine gun batteries visiting thickly populated districts in order to give a demonstration to assist recruiting.

Week-end Accidents.

Last week-end we saw the result of two accidents in which motor cyclists were involved. In one case a motor cyclist had emerged from a side lane, and collided with a car; and in the other case a passenger suddenly stepped from a motor 'bus as a motor cyclist came by, and both were brought down heavily.

Solder the Lamp to the Bracket.

The Auto Cycle Union has been in communication with the Home Office and the Commissioner of Police of the Metropolis with reference to the interpretation of that part of the Order in Council of June 10th, 1915, amending the Defence of the Realm Act which affects the use of motor cycle lamps attached to the lamp brackets by an adjustable fitting, permitting the lamp to be readily moved.

The Auto Cycle Union is authorised to state that the use of such lamps is considered to be a contravention of the Order, and to advise all owners to render their lamps incapable of any swivelling movement by some permanent mechanical means, such as soldering the lamp to the bracket.

THE IRISH "END TO END." E. J. Jack (3½ h.p. Rover), F. L. Dooly (4¼ h.p. B.S.A.), and R. Jones (4¼ h.p. B.S.A.) outside a typical Irish thatched cottage.

This Week's Issue.

This issue of *The Motor Cycle* contains a fully illustrated report with complete results of the Wolverhampton M.C.C. hill-climb at Style Cop. The centre pages are devoted to illustrations of the event. The Irish End-to end trial is also fully dealt with.

Despatch Riders Wanted in Scotland.

We hear that the Lowland Divisional Signal Company R.E. (T) has vacancies for seven motor cyclist despatch riders. The first line Signal Company is at present abroad, and the second line Signal Company is at present in training. Motor cyclists are required for drafts for these companies. The pay is from 10s. 8d. rising to 28s. per week when fully trained. Application should be made for full particulars to the O.C. Depot, Lowland Divisional Signal Company, R.E. (T), Drill Hall, Rutherglen.

Echoes from Style Cop.

Style Cop hill-climb did not go off with the smoothness which one has become accustomed to expect, but this was not due to the lack of officials (there were sixty-two names on the programme). The spectators, amongst whom were many working men, frequently trespassed on the course at inconvenient moments. H. W. Wolverson had a rather unusual experience, for he won the Cycle Car Class on formula without being timed up the hill!

Motor Cycle Lamps.

On the previous page the opinion is expressed that the usual motor cycle lamp fixed, for adjustment purposes, by thumbscrews at the side contravenes the new regulations. However, at the South Western Police Court on the 16th inst., when G. B. Creed was summoned for having such a lamp, the magistrate, Mr. Lister Drummond, having examined the lamp in Court, advised the police to withdraw the summons, as he was of opinion that the lamp was not illegal.

Sidecar Outings for Convalescent Soldiers.

Although the idea of sidecar runs for wounded soldiers has met with opposition in certain quarters, the commendable practice continues to grow throughout the country, and nearly every day we hear of motor cyclists arranging plans to give our gallant soldiers a run into the country. From experience gained on the Brighton outing which we organised a few weeks ago, we can say that the men thoroughly enjoy a run in a good sidecar outfit, and, provided they are well wrapped up and carefully driven, no harm can possibly result; in fact, the very reverse is the case.

A Motor Cycle Traffic Census.

Our sister journal, *Motor Traction*, has just published its annual Putney Bridge traffic census. This is the tenth year this has been done, and the following information relating to motor cycles is of interest. In 1906 129 motor cycles crossed the bridge between the hours of 9 a.m. and 9 p.m., in 1911 the number was 193, in 1912 347, in 1913 358, in 1914 653, and in 1915 (on Sunday, June 27th) 413 crossed. It will be seen from these figures how the ranks of motor cyclists are steadily on the increase, ignoring, of course, the war time census.

From Overseas to Enlist.

Noticing the photograph that appeared in our last issue of a rider who travelled from California to enlist, a sergeant in the 37th Signal Company writes to the effect that in his section of despatch riders they have six men who came from overseas to serve. Two came from the Argentine, and one each from Ceylon, Egypt, South Africa, and Canada. Can any section beat this record?

Clubs and the War Loan.

The Bristol M.C.C. has decided to invest £50 in the War Loan. The club intends to hold a picnic on Saturday next and a speed-judging competition on August 28th, the winner of which will hold Mr. J. King's silver cup for twelve months.

After the War Loan had closed the M.C.C. Committee met and decided, if possible, to invest £400 of its funds in the loan. This is the fourth motor cycling body which has adopted the recommendation in *The Motor Cycle*.

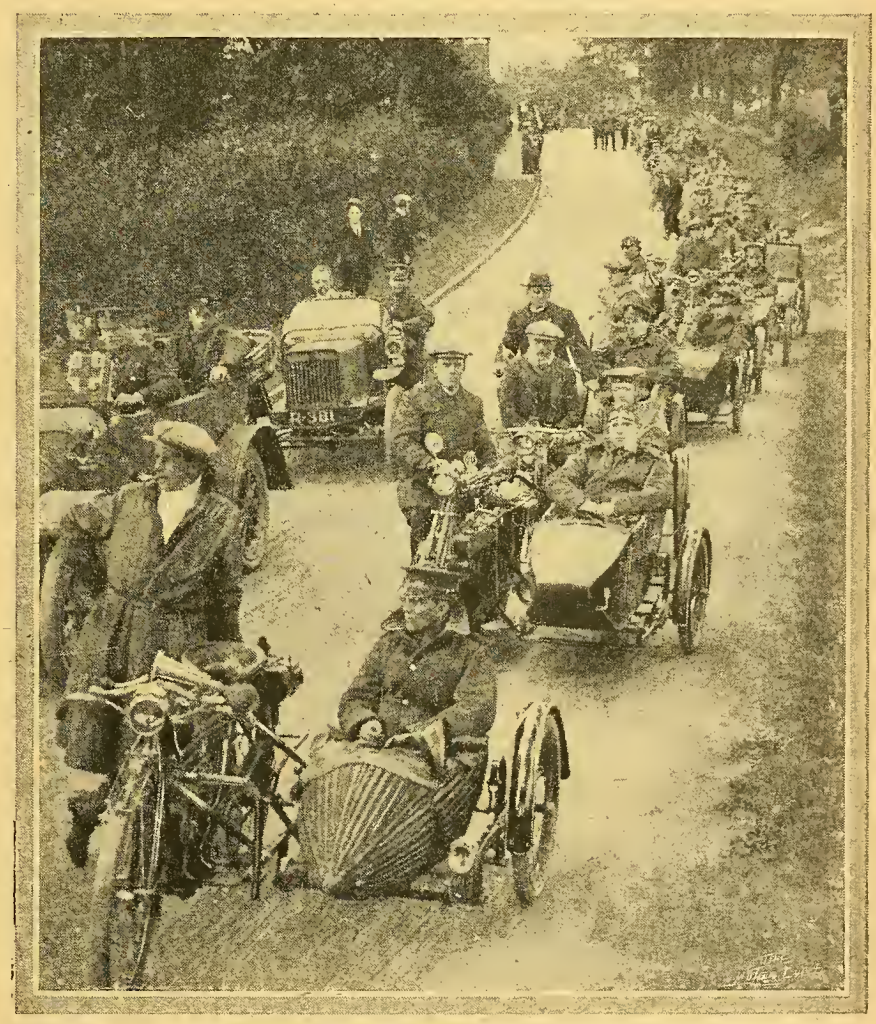
The War Funds.

Subscriptions continue to roll into the principal war funds, as the following figures (those of last Tuesday) indicate:

The Times Fund for Sick and Wounded	£1,550,335
Daily Telegraph Belgian Relief Fund	148,989
The Queen's Work for Women Fund	162,579
Indian Soldiers' Fund ...	142,935

Motor Cyclists and Recruiting.

The recruiting officers at Barrow-in-Furness, Birmingham, Sheffield, and Bristol last week referred recruits to the Editor of this journal respecting different motor cycle sections about which enquiries had been made. This is pleasing to us, as we have cause to know that originally prospective recruits were turned away without advice if they mentioned a branch of the Army with which the recruiting officer was not acquainted.



SIDECAR RUNS FOR WOUNDED SOLDIERS.

A snapshot of some of the sidecar outfits (and their gallant occupants) used in a trip made by a party of Manchester motor cyclists from the Stretford Hospital to Herridge, Macclesfield, on Sunday last. There are about twenty-five machines in the picture, and it is probably the largest outing of its kind seen so far, though it may not long remain unbeaten.

ENTRIES FOR THE ALL-KHAKI RACE MEETING.

AT the time of going to press, the following entries have been received :

Sec.-Lieut. T. H. Blake (3½ T.T. Rudge-Multi).
Lieut. J. H. C. Lindsay (3½ T.T. Rudge-Multi).
Sec.-Lieut. F. M. C. Houghton (3½ T.T. Rudge-Multi).
Captain G. L. Andrew (2¾ T.T. Douglas).
Lieut. G. H. Walker (3 Enfield).
Sec.-Lieut. J. F. Blyth.
Sec.-Lieut. C. E. H. Medhurst.
Sec.-Lieut. E. C. Kemp.
Sec.-Lieut. J. A. Barraclough.
Assistant-Paymaster C. P. Marcel, R.N.R. (7-9 Indian).
Corporal O. M. Baldwin.

Entries close on July 31st, and the should be addressed to Mr. T. W. Loug borough, c/o the Auto Cycle Union, 8 Pall Mall, S.W. A list of the events be held and other particulars will l found on page 91 of this issue. Frien accompanying competitors will be a mitted to the track on payment of o shilling for each person.

STYLE COP HILL-CLIMB SPECIAL AWARDS.

The following are the results on formula and special awards of the open hill-climb described on page 83 :

Class I.		
A—1.	H. Newey (Levis, 60×70) ..	3025
2.	C. Lindall (ditto)	3091
3.	W. H. Butterfield (ditto) ..	3388
B—1.	W. H. Butterfield (ditto) ..	3042
2.	C. Lindall (ditto)	3074
3.	G. E. Kuhn (ditto)	3359
Class II.		
A—1.	O. Wade (A.J.S., 74×81) ..	2840
2.	F. H. Giles (ditto)	2917
3.	W. Heaton (ditto)	2924
B—1.	G. Dance (Sunbeam, 75×79) ..	3011
Class III.		
A—1.	J. L. Mitchell (A.J.S., 74×81	2676
2.	O. Wade (ditto)	2819
3.	G. Dance (Sunbeam, 75×79) ..	2858
B—1.	G. Dance (Sunbeam, 75×79) ..	2989
2.	N. Heath (A.J.S., 66½×86) ..	3290
3.	B. Haddock (Diamond, 75×79)	3405
Class IV.		
A—1.	G. Dance (Sunbeam, 75×79) ..	2620
2.	W. Heaton (A.J.S., 74×81) ..	2795
3.	O. Wade (ditto)	2860
B—1.	O. Wade (A.J.S., 74×81) ..	2720
2.	G. Dance (Sunbeam, 75×79) ..	3033
3.	N. Heath (A.J.S., 66½×86) ..	3131
Class V.		
A—1.	W. Heaton (A.J.S., 74×81) ..	2708
2.	F. H. Giles (ditto)	3093
3.	J. E. Greenwood (Sunbeam, 88×105)	3495

Class VII.

1. H. W. Wolverson (Morgan Runabout, 85×85).

Special Awards.

SUNBEAM GOLD MEDAL (for fastest time of the day).—T. Simister (8 Dot-Jap).

ALFRED BIRD CUP (for best performance on formula by a member).—G. Dance (2¾ Sunbeam).

A. J. STEVENS GOLD MEDAL (for best aggregate performance).—G. Dance (2¾ Sunbeam).

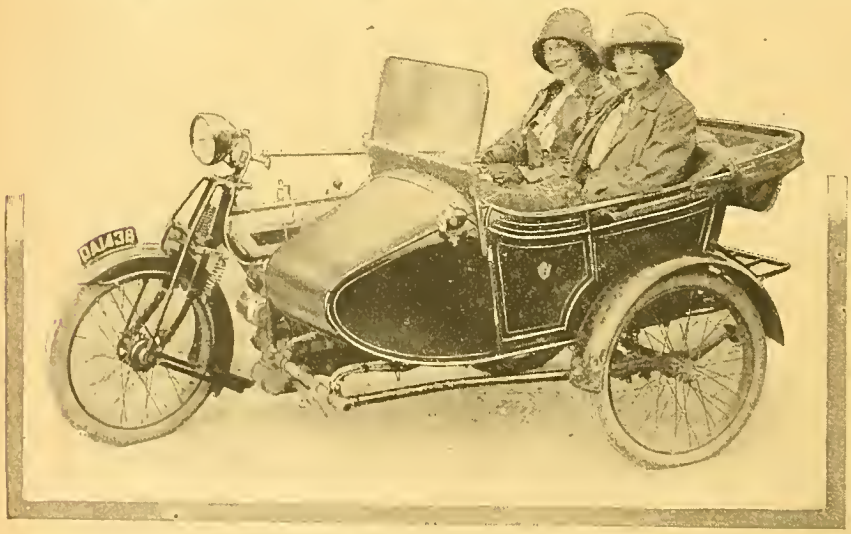
AVON CUP (for best performance on formula in Class II. B. by a member).—G. Dance (2¾ Sunbeam).

CLYNO CHALLENGE CUP (for best performance on formula in sidecar classes).—W. Heaton (2¾ A.J.S.)

DIAMOND GOLD MEDAL (for fastest time by a member in Class II. B.)—G. Dance (2¾ Sunbeam).

WOLVERHAMPTON MOTOR SERVICES CHALLENGE SHIELD (for best amateur performance by a member).—G. Dance (2¾ Sunbeam).

Rodolfo Cardenal (3½ h.p twin-cylinder Indian), winner of the Spanish road race referred to on page 37 of our issue of July 8th.



THE SOCIABLE SIDECAR.
Miss Daisy Stevens and a friend arrive at the Style Cop hill-climb in a double-seated side-by-side sidecar attached to a 6 h.p. A.J.S.

IMPORTS OF PETROL.

12,662,635 gallons of petrol were imported into this country last month. In June of last year the figure was 13,993,003, and in May, 1915, it was 8,190,910 gallons. Thus, although there is a drop in the latest figures when compared with the corresponding period of last year, there is a decided increase over the May, 1915, figures. The value of the 12,662,635 gallons received last June is £443,344.

WELL KNOWN MOTOR CYCLIST WITH THE COLOURS.

In Oxford Street, London, last week we encountered A. Mackenzie Cott, the erstwhile enthusiastic big twin user, who has many times accomplished fastest time at open hill-climbs. Lieutenant Cott obtained a commission in the Royal Flying Corps in the winter, and is now in charge of a section. He was wending his way to the Royal Aircraft Factory on a 20 h.p. Crossley, and hailed with joy the prospect of meeting a late member of our staff who is now an instructor at the R.A.F.

THE MIDLAND MOTOR CYCLISTS' VOLUNTEERS AT LITTLE PACKINGTON.

ON Sunday the corps turned out for a field day in the vicinity of Little Packington for observation duties. This parade commenced the second stage of the corps training.

On reaching Little Packington a section was detailed off, its instructions being to place itself against backgrounds of woods, trees, etc., not actually under cover, but sufficiently exposed for the men to detect their presence at a distance.

The troops were then sent out to locate the section from a distance, judge the distance, and also report on the ground covered.

A party was next taken to a trench with a slope, which was presumed to be a fire trench. The others had from a distance to give information as to the number seen, and report on any attempt made to leave the trench.

The corps was then taken to the flooded fields, and was exercised in endeavouring to get through with its machines. The chief trouble was caused by water getting into the silencers.

On Sunday next the corps will hold a field day near Great Alne prior to going into camp.

THE IRISH END-TO-END TRIAL.

Large Proportion of Finishers in the Big Event of the Irish Competition Programme.

Some of the competitors outside the control at Banbridge.

THE End-to-end of Ireland reliability trial of the Ulster Centre of the Motor Cycle Union of Ireland, which is annually held during the period known in the North of Ireland as "the twelfth" holidays, has come to be regarded as the leading event of the year in Irish motor cycling circles. Last year it was recognised by the Cycle and Motor Cycle Manufacturers' Union as one of the "selected" events, but even without that recognition it has attained an importance greater than any other trial in the Emerald Isle, and has for some years past attracted entries from the leading competition riders of the United Kingdom. This year the most notable feature of the competition, which was held on Tuesday and Wednesday of last week, was the fact that the entry was purely Irish. The title of the trial is rather a misnomer, for while it started from Mizen Head and went to Fair Head—the points of Ireland furthest apart—it did not end at the northern point, the men being taken back to Belfast, and in the South a detour was made to bring in the mountainous parts of Co. Kerry. The making of the event a two-day run—an innovation which was made for the first time last year—made the event less of a scramble, though hardly less strenuous a test than when the trial was a straight-away affair. The first day's run was 299 miles, terminating in Dublin; and the second was 213, terminating in Belfast. As there was but an hour's stop each day for luncheon, and as the conditions made a strict adherence to schedule time absolutely necessary, it was a genuine test of the reliability of the machines and the ability of their riders to keep to schedule.

Mr. and Mrs. A. W. Mooney (6 h.p. Bradbury and sidecar) appreciate a second breakfast in the open air at the Drogheda control.

The Conditions of the Trial.

Generally speaking, the conditions may be described as of the customary character. The course was divided into fifteen sections, to each of which ten marks were allotted, and one mark per minute was lost for being more than a minute early or more than three minutes late at any of the open controls at the end of each section. In addition, secret checks were provided, and a competitor found to be ten minutes in advance of schedule time at any point was disqualified. A hill failure was penalised by the loss of ten marks, and an average speed of twenty miles an hour had to be observed.

Experience having shown that the likelihood of several men tying under such conditions was probable, a flexibility test was held in the mountainous country round Cushendall on the afternoon of the second day to ensure a winner being found for the Palmer Tyre trophy. As a fact, twelve got full marks at all controls. After a non-stop run from the foot of the hill at Cushendun, penalised at ten marks per stop, the flexibility test was held on Iscar Hill.

Out of an entry of twenty-one, nineteen competitors came to the start. Five of these were on sidecar combinations and fourteen on singles.

The start took place on Tuesday morning at four o'clock from Rock Island coastguard station, the nearest point by road to Mizen Head and three miles south of Goleen, where most of the competitors spent the night—in the street. The men were sent away at one minute intervals by Mr. W. E. Good, of the Palmer Tyre, Ltd., and as it was generally assumed—and correctly as things turned out—that there would be no secret checks in the first few hours of the journey, there was a good deal of hurrying over the first section of the course. Indeed it is pretty safe to say that had a secret check been found in any portion of the first fifty-three miles to Kenmare the whole field would have been disqualified. It was generally agreed, amongst competitors at any rate, that a greater margin of grace might have been allowed without the object of the trial being defeated, and it certainly is an

The Irish End-to-end Trial.—

anomaly that the extreme penalty should be enforced against a technical breach of not running to schedule, while a competitor could be hours late at every check on the route of 512 miles and yet win a silver medal, provided he was not more than an hour late at the last control on each of the two days.

The First Observed Hill.

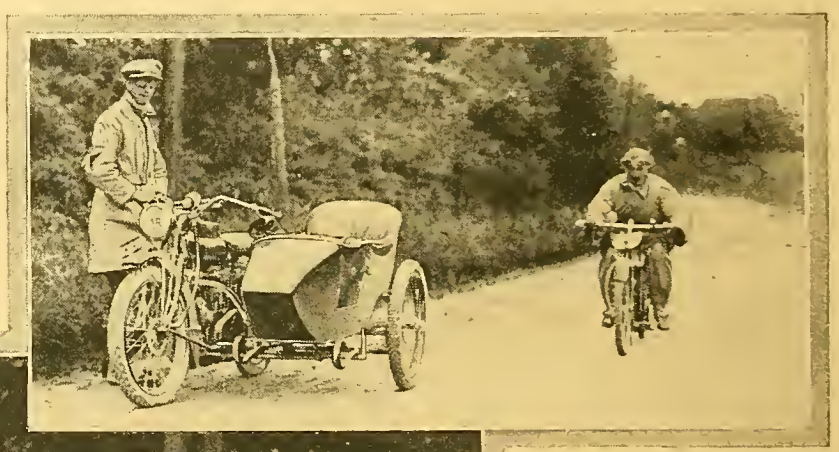
Observers were looked for in vain, as the long ascent of the mountains from Glengarriff was made in a heavy mist; but, as a fact, there was no failure to make a clean ascent, as the improved surface, coupled with the manner in which the road is engineered, has reduced the one-time terrors of the climb.

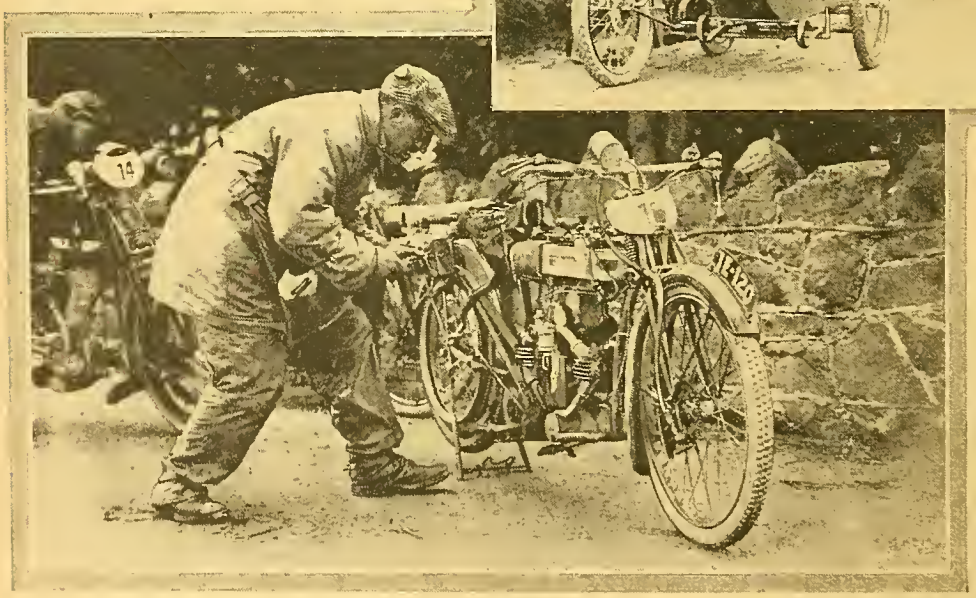
Technically, every hill on the route was an observed hill, and failure to make a clean ascent on the first attempt rendered the competitor liable to penalty, but practically the only hill on the first day's run that was observed was Gowlane Hill on the old coach road to Killarney. A hill that deserved observation was Ballaghabeama Pass between Kenmare and Killarney. Gowlane was included in the End-to-end route last year, and was also in the Cork twenty-four hours trial. It is a straightaway ascent across the mountains, engineered after the manner of the Romans. Its surface is roughish, but it is not of the impassable class. Summerfield (2¾ New Hudson) found his power too low for the climb, and Chambers (4¼ B.S.A.) had the misfortune to blow out a plug. Jack (3½ Rover) missed the turn at the top after making a clean ascent of the whole hill and was penalised, and Farren (5 Indian) registered ten marks against the Indian team and himself by stopping to chat to some friends while in the non-stop section.

Only one man (Summerfield) failed to make a clean ascent of Ballaghabeama Pass.

The observation of Gowlane was entrusted to the members of the Cork club, and, presumably, they were also responsible for the marking of the route through Kerry. On the result they may be congratulated, as even the stranger found little difficulty in following the intricate course from the foot of the pass to Glencar, Beaufort, and Killarney, where, with a hundred miles covered, the second check was taken.

The Killarney to Limerick section led through Castleisland, Abbeyfeale, Newcastlewest, Rathkeale, and Adare, and except for the ascent into the mountains from Castleisland, it did not present any difficulties, and the sixty-five miles run was not marked by any incident. At Limerick there was the one and only stop of the day, an hour being allowed for lunch, and, as at Killarney, all were on time, except Summerfield, who was just outside the three minutes grace.





(Upper) C. B. Franklin stops his Indian and sidecar to allow the photographer, who was his passenger, to take a snapshot.
(Lower) "Sou'-wester," who, by the way, wore a cap, makes a few adjustments to his Douglas.

The direct road to Dublin was lengthened by taking the competitors to Tipperary, and thence to Cashel. The only secret check of the day was south of Cashel, but no one was found in advance of time.

The Second Day's Run.

When the second stage began on Wednesday all the starters were still in the running. The machines were in control overnight in Mr. F. A. Wallen's garage in St Andrew's Street, and at 6.30 the first man was sent away. The day's run was considerably shorter than that of the previous day, and there was nothing in the earlier stages of the route to cause any anxiety. In fact, it was generally regarded as a joy ride until Iscar Hill was reached in the afternoon for the flexibility test, and as this was looked on as the deciding factor in the competition, there was a general determination not to do any unnecessary speed work, so as to bring the engines to the foot of the hill in nice tune.

The northward journey followed the main Dublin to Belfast road by Swords, Babriggan, Drogheda, Dunbar, Dundalk, and Newry to Banbridge, checks being taken at three points. The cross-country cut from Banbridge to the Belfast-Portrush road at Antrim was looked forward to with a certain amount of trepidation, owing to its winding and intricate nature, but, thanks to the good offices of the police, who acted as living signposts all along the route, coupled with the plentiful scattering of arrows, there was little difficulty in following the official course, and Antrim was reached for lunch in good time by all save Summerfield, whose handlebar broke at Moira, compelling his retirement.

After luncheon a broad main road was followed to Ballymena, where the riders left the direct End-to-end course which they had followed from Cashel and crossed the mountains in a north-easterly direction to the coast at Cushendun, where a check was taken before entering on the observed hill and flexibility test. The two hills produced more trouble than any other part of the route, but the percentage of clean ascents was greater than in any competition held on the hill. Henderson (7 Harley-Davidson sc.) was stopped by the first sharp rise and lost his clean certificate. Jack (3½ Rover) fell in going down one of the dips. The wheel of the 6 Bradbury sc. ridden by Ladd failed to bite, and he actually slipped down the hill while his engine was running. Doleman (3½ Rover) lost his com-

The Irish End-to-end Trial.—

pression tap, and Wood (4¼ B.S.A.) broke a chain at the start of the flexibility test, but before actually entering it. He repaired the chain, and made a clean ascent, and will probably not be penalised.

After Ballyvoy it was plain sailing to the finish. The ascent from Iscar was followed by a grand run down to Cushendall, and then the coast road of Antrim was followed to the finish. Eighteen of the nineteen starters checked in on time at Fortwilliam Park.

Quite a number of men having scored full marks at all the open and secret controls, it was necessary to take into consideration their performances in the flexibility test to award the prizes.

The Awards.

W. H. Freeman (7-9 Indian) was adjudged to have made the best performance and was awarded the Palmer Trophy, the second and third prizes going to J. Doleman (3½ Rover) and R. S. Russell (2¾ Douglas) respectively. For the fourth prize there was a tie between C. B. Franklin (7 Indian sc.) and J. Stewart (2¾ Douglas).

The prize for the best unplaced sidecar performance was won by A. W. Mooney (6 Bradbury), and the team prize by the Douglas team, consisting of J. Stewart, R. S. Russell, and "Sou'-wester." All of these men were awarded gold medals in addition to the prizes.

The following also secured gold medals: T. Toole (4¼ B.S.A.), J. Dwyer (4 Triumph), and F. L. Dooly (4¼ B.S.A.)

Silver medals were awarded to the following: J. Farren (5 Indian), W. J. Henderson (7-9 Harley-Davidson sc.), W. J. Chambers (4¼ B.S.A. sc.), J. Browne (3½ Rover), T. W. Ladd (6 Bradbury sc.), E. G. Jack (3½ Rover), R. Jones (4¼ B.S.A.), and J. T. Woods (4¼ B.S.A.)

The All-Khaki Race Meeting at Brooklands.

Officials Appointed. Event to be held Saturday, August 7th.

SINCE our last issue went to press, considerable progress has been made in the organisation of a race meeting for officer motor cyclists. Together with Mr. T. W. Loughborough, secretary of the A.C.U., we have inspected the track. The road into Brooklands leading into the park, adjacent to the flying ground, was in process of being laid with Tarmac, and in a very short time will be in fine condition. The paddock will be put into repair by the time this meeting is held (Saturday, August 7th). The amount of track available, namely, about one and a half miles along the railway straight, will be put into sufficiently good order to enable half mile sprint races to be held.

The actual organisation of the event will be undertaken by the British Motor Cycle Racing Club, and entries should therefore be sent to the secretary, Mr. T. W. Loughborough, c/o The Auto Cycle Union, 83, Pall Mall, S.W. The cost of entry is 2s. 6d., and there will be an additional *deposit* of 2s. 6d., which must be enclosed, for the privilege of using the B.M.C.R.C. number plates.

As regards officials, the following have consented to act: The joint secretaries of the meeting will be Mr. T. W. Loughborough and Second-Lieutenant F. M. C. Houghton. The stewards will be Major D. F. Nicholl, D.S.O., R.A., D.A.A., and Q.M.G., Dr. A. M. Low, Second-Lieutenant, R.F.C., and Captain A. H. Loughborough, R.G.A. Timekeepers, Messrs. A. V. Ebblewhite and A. G. Reynolds.

A preliminary programme has been drawn up, which we reproduce herewith. As July 31st was considered to allow insufficient time to get in entries, the date of the meeting has been arranged one week later.

THE ALL-KHAKI MOTOR CYCLE RACE MEETING.

(Under the auspices of the B.M.C.R.C.)

Open to members of the British Army or Navy, or the Allied Forces (in uniform), beginning at 2 p.m. Saturday, August 7th.

EVENT 1.—The Lightweight Half-mile Sprint Race for motor cycles fitted with engines not exceeding 270 c.c.

EVENT 2.—The Douglas Motor Cycle Sprint Race. Open to all riders of Douglas machines.

EVENT 3.—Medium-weight Half-mile Sprint Race for motor cycles fitted with engines not exceeding 550 c.c.

EVENT 4.—Unlimited Half-mile Sprint Race for motor cycles fitted with engines not exceeding 1,000 c.c.

EVENT 5.—The Passenger Half-mile Sprint Race for sidecar outfits fitted with engines not exceeding 1,000 c.c., and cycle cars not exceeding 1,100 c.c.

EVENT 6.—Two gymkhana events.

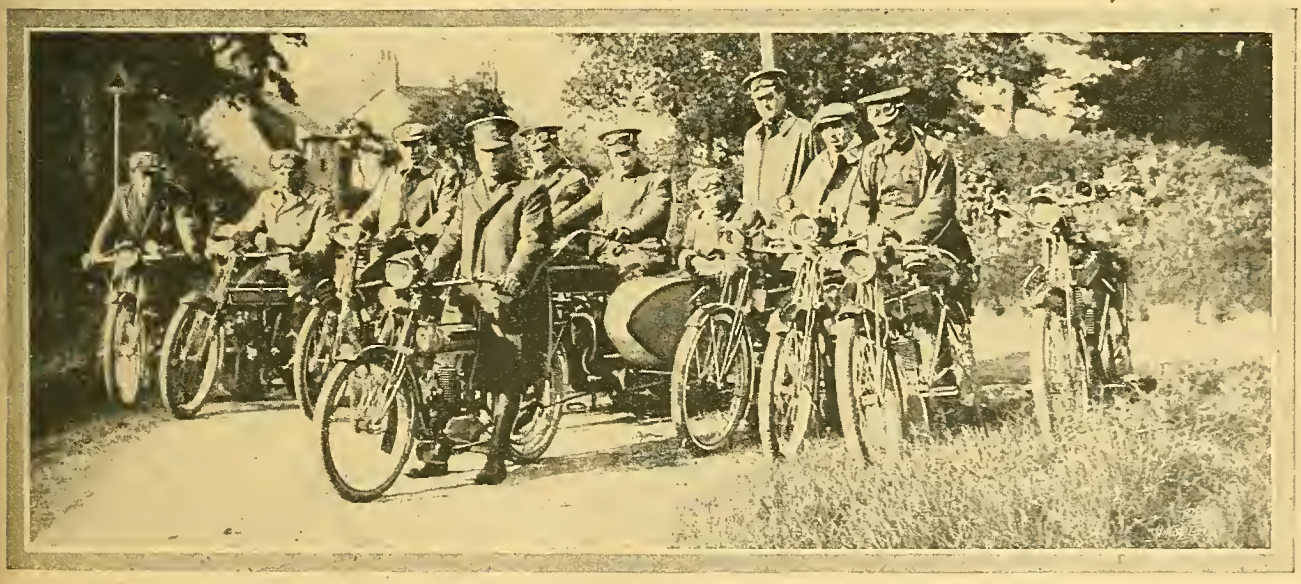
EVENT 7.—Hill-climb.

Entries close on Saturday, July 31st.

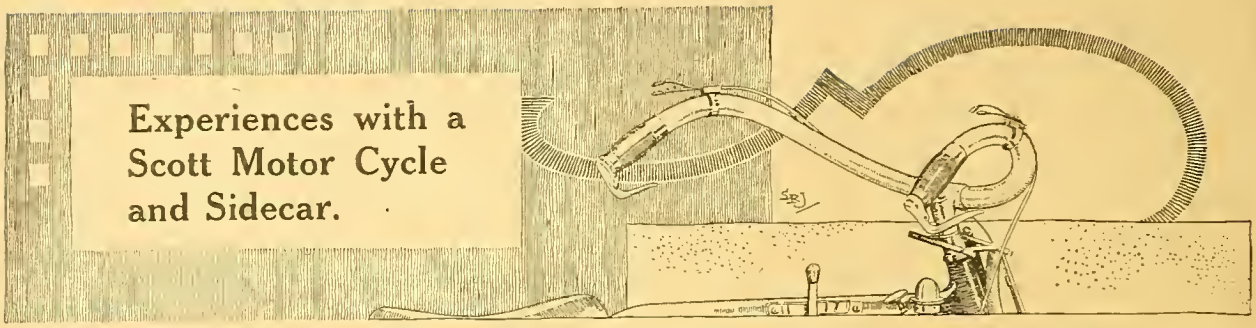
A silver cup, presented by the proprietors of *The Motor Cycle*, will be awarded to the competitor making the best aggregate performance.

The Brooklands authorities hope to arrange for lunch and tea to be supplied to competitors, officials, and spectators at reasonable charges.

We must again remind our readers that the general public are not admitted to Brooklands; only members of the B.A.R.C. and the B.M.C.R.C. will be admitted, and officers and men in uniform.



Despatch riders attached to the Liverpool Mechanical Transport Corps, National Volunteer Reserve.



Experiences with a Scott Motor Cycle and Sidecar.

With some Hints and Tips on Care and Upkeep by a Member of our Staff.

(*Concluded from page 52.*)

Reassembling the Engine.

The various parts of the engine are now ready for assembly, and certain packing joints will be required as follow:

Eight transfer port washers.
Two cylinder base rubber rings.
Two cylinder base linen rings.
One bottle of Silico enamel.

First of all, the crank case should be turned upside down and some thick oil poured in on the connecting rods, so that it runs down on to the gudgeon pins and bushes. The crank case can now be returned to its normal position on the bench, and the rings put back in their respective grooves (with three strips of tin) on the pistons, making sure that they are in their correct positions as regards their slots. The bottom ring should be turned round with the fingers until its slot is midway between the relative positions of the exhaust and inlet ports, as shown in the diagram, thus preventing the edges of the piston ring from catching on the port lips.

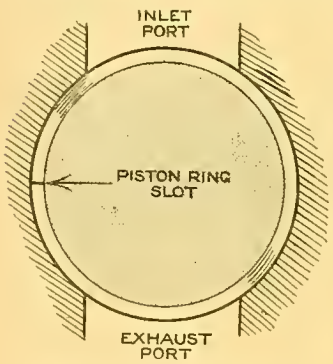


Diagram showing correct position for seat of bottom piston ring.

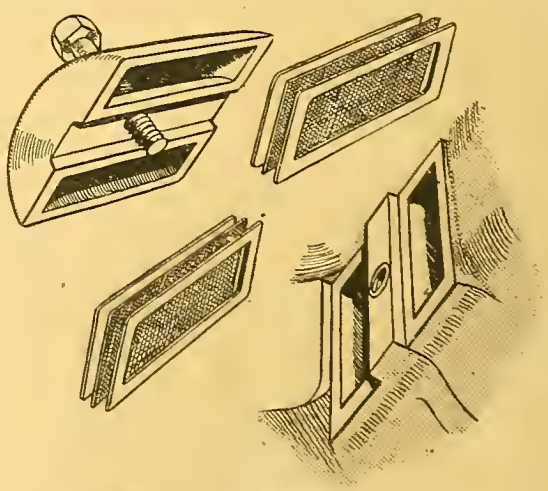
An operation entailing a certain amount of care now confronts us, namely, replacing cylinders over pistons and bedding them down in position on the crank chamber. Take a perfectly clean brush and paint the cylinder walls and pistons with some good lubricating oil, but do not let any drip on to the surfaces that receive the cylinders on the crank chamber. The inner cylinder rubber ring joints should now be slipped over the cylinder extensions as well as the linen ring joints in position on the crank chamber, the latter being coated on either side with Silico enamel. The next operation is to turn the flywheel round until the two piston heads are level with each other, and in doing so be careful not to dislodge the piston rings from their correct positions in the slots. While you hold the pistons vertically, get someone to let the cylinders down gently over the pistons, meanwhile coaxing each ring into the cylinder bore as the cylinder casting descends. Finally, just before the cylinders actually bed down adjust the linen and rubber rings into their true positions. The cylinders can now be bolted up to the crank chamber, each nut being given small turns in succession to equalise the pressure on the joints.

The replacement of the transfer ports, covers, and gauzes on the engine may now receive attention. As there are two gauzes and four packing joints under each port cover it might be surmised by the novice that they are a matter of difficulty to fix in position, but, provided the faces of the ports and covers are clean, and that a little care is taken to see that the washers are each gently coated with Silico enamel and carefully placed in position, there can be no possibility of leaks past the packing occurring at any time. The enamel is best applied in this case with a child's small paint brush, and if the engine can be shifted near a large window the extra light gained will be found to be of great service. When all the packings and gauzes are in position each transfer port cover should be tightened down without violent strain, as the cover is only of aluminium, and is not made to withstand undue force. The exhaust port covers are returned to the engine with screws, the joints in this case being made with



Transfer port cover and component gauges and packings ready for assembling on cylinder port openings.

The AUTO-CYCLE UNION

Another illustration of Progressive Policy.
The new rules provide that membership now carries
Full Privileges for a complete year from date of joining
(instead of until December 31st of each year).
The Auto-Cycle Union Insurance Policy covers all risks.
It is backed and guaranteed by the Law Accident Insurance Society, but
Disputed Claims are settled by the A.C.U. Committee.
All policies taken out under TABLE III. include,
Free Touring Membership of the A.C.U. without increase of Premium.

Or you can obtain these privileges for Per 5/- Annum. Is it possible to expend such a trifle to better purpose?

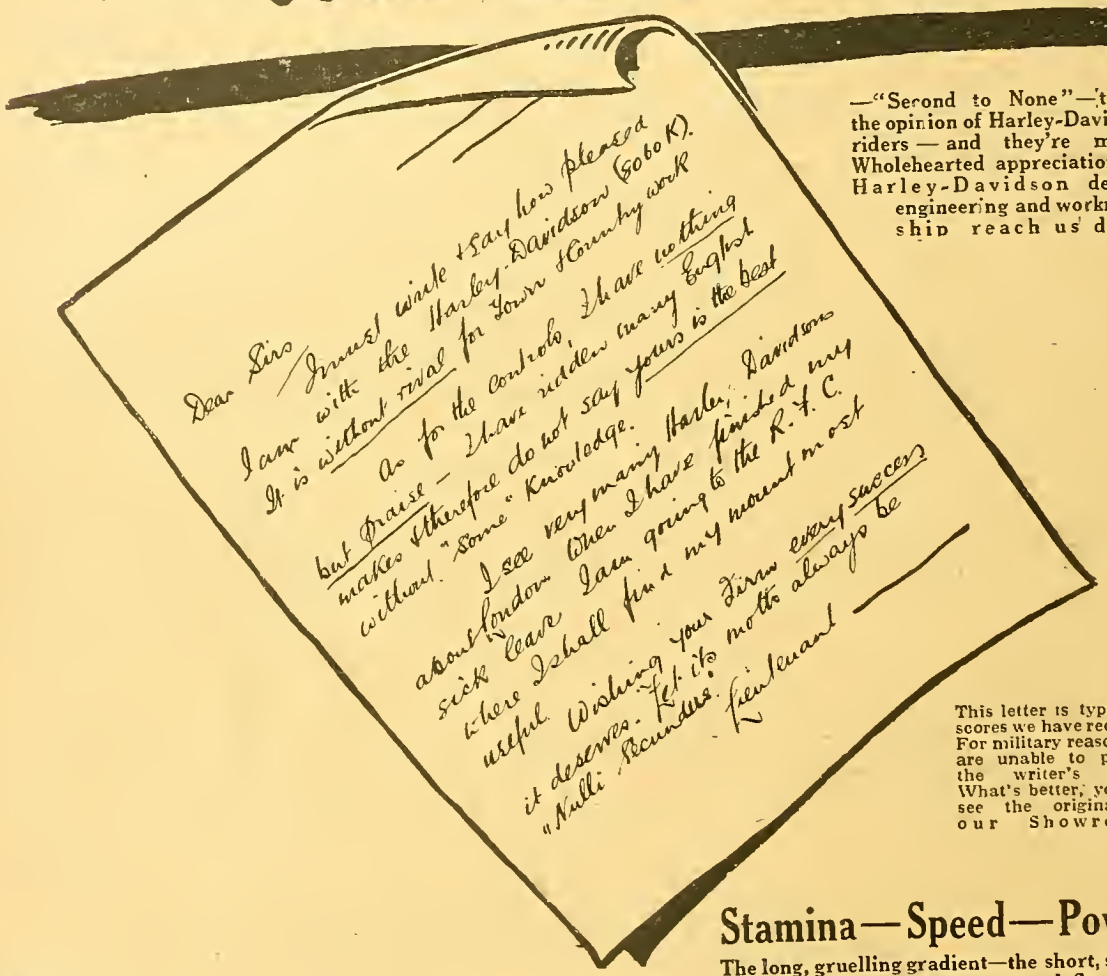
A FEW LIVE AGENTS STILL WANTED.

"Nulli Secundus"



Dear Sirs
I am with the Harley-Davidson (1060 K).
It is without rival for Town & Country work
but Praise – I have written many England
without "Some" Knowledge.
I see very many Harley Davidson
about London. When I have finished my
sick Leave I am going to the R.F.C.
where I shall find my mount most
useful. Wishing your firm every success
it deserves. Yet its motto always be
"Nulli Secundus".
Yours Lieutenant

—"Second to None"—that's the opinion of Harley-Davidson riders — and they're many. Wholehearted appreciations of Harley-Davidson design, engineering and workmanship reach us daily

This letter is typical of scores we have received. For military reasons we are unable to publish the writer's name. What's better, you can see the original at our Showrooms

Stamina—Speed—Power

The long, gruelling gradient—the short, sharp, uphill grind, prove the power and flexibility of the machine that's strong to endure, having speed and stamina beyond the normal

Telephone—Museum 2070 (3 lines). Telegrams—"Hardavmocy, Ox, London."

In answering this advertisement it is desirable to mention "The Motor Cycle."

Experiences with a Scott Motor Cycle and Sidecar.—

well-mixed aluminium paint instead of enamel, but this operation cannot be carried out until the engine is in the frame.

Final Adjustments.

After clamping the crank case doors in position, the engine is now more or less complete and ready for installation in the frame, according to the instructions of the makers. The lubricator feed pipes should be thoroughly cleaned with petrol and returned to the engine, and the carburetter may now be fixed in position with a leather joint (coated with boiled oil) between the induction pipe and crank chamber.

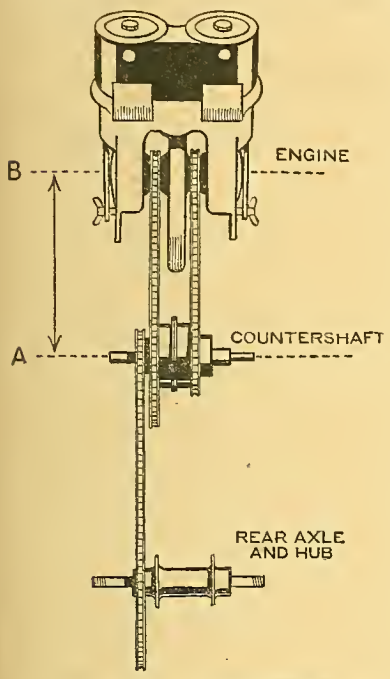

Diagram of Scott chain transmission.

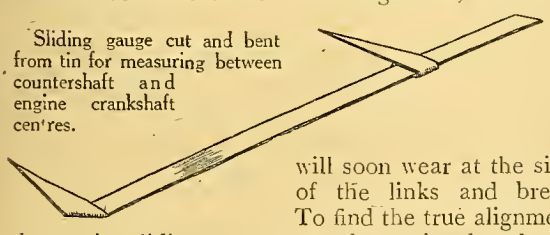
One hears at times a certain amount of unjustifiable criticism concerning the chain drive transmission on the Scott, which the writer is inclined to put down to ignorance more than anything else. The transmission on this machine *must* be looked after as with any other, and it is quite certain that the chains and rear tyre last longer on a Scott than on most machines, owing to the smooth "four-cylinder" torque. The chains on the writer's machine are practically as good as new after four to five thousand miles, and breakage is certainly not feared yet. The diagram above shows the Scott transmission in plan form. To adjust the engine-countershaft chains, the countershaft is moved bodily either backwards or forwards on the lower tubes of the frame, but it is of vital importance to see that its axis A (see diagram) is dead parallel with the engine crankshaft B. If the countershaft is out of alignment, the chains



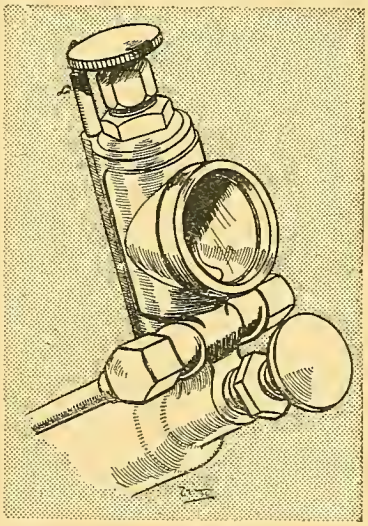
Sliding gauge cut and bent from tin for measuring between countershaft and engine crankshaft centres.

will soon wear at the sides of the links and break. To find the true alignment, make a tin sliding gauge, as shown in the sketch, and measure between centres of engine cranks and countershaft spindle, and adjust accordingly. If the countershaft is now parallel with the engine and one chain is in nice tension and the other very slack, unship the latter and take out a half link, and readjust the countershaft until both chains are right. As these chains generally run at high speeds in an enclosed state, they will run for a long time without fresh adjustment, *provided* the countershaft is in true alignment. To repair and alter the length of the chains themselves, the best advice that can be given to a novice is to consult the Renolds instruction booklets. The rear chain is easily kept in adjustment by sliding the rear wheel backwards or forwards; it should be lubricated with ordinary engine oil every hundred miles, and washed in paraffin and soaked in hot tallow every thousand miles. The writer has seen some Scotts habitually ridden with a perfectly dry rear chain, with the consequence that both the sprockets and chain wear rapidly with a liability of breakage at any moment. If the sprocket teeth have worn "hooky," the sprockets should be replaced by new ones in addition to a *new* chain, as the old chain has stretched and would not fit the new teeth.

The black portions show how sprocket teeth wear "hooky."

How to obtain Smooth Running.

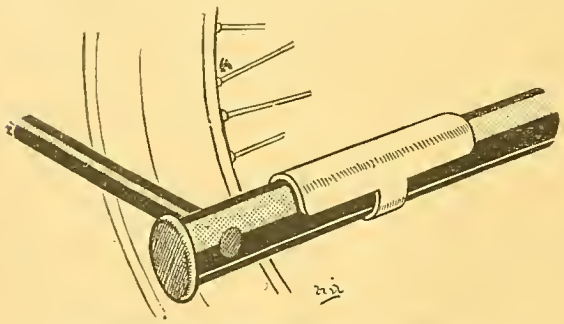
"Four-stroking" and general misfiring seem to be old bogeys with some Scott owners. With the decompressor in action the engine of the writer's machine can be throttled to run so slowly that the individual explosions can be counted on the fingers, or with full compression in operation the machine can be slowed down to five or six miles an hour on top gear without misfiring occurring. This is done by eliminating air leaks and running on the pilot jet with careful extra air adjustments. If an air leak develops in the transfer ports or crank case joints, or in the induction pipe or carburetter, the slow running is completely upset and it is useless to try and effect a recovery by altering the carburetter setting or ignition. If an engine has been very badly mishandled, and the cylinders and pistons have worn badly through lack of consistent lubrication, a cure cannot be effected very well as regards misfiring, as the explosion gases pass the pistons and adulterate the crank case mixture. The obvious alternative is to have the cylinders rebored and pistons ground to fit. However, in the case of an engine that has been well looked after, but has seen a lot of life, new piston rings will often completely restore its vitality after a short time.



Reconstructed sight feed glass on the writer's Scott.

Experiences with a Scott Motor Cycle and Sidecar.—

There is one point which some riders of later date Scotts may not have noticed, and that is, misfiring caused by leakage of air through a cracked oil-drip feed glass down the oil pipes into the engine. It can be cured sometimes by introducing a new glass and leather packing, but the design of the sight-feed fitting is such that if there is the slightest inaccuracy in its workmanship air passes in and the oil leaks out. The trouble was remedied in the writer's machine by making and fitting an entirely new form of glass which is circular in shape. The original glass was taken out and the screw-down plug above it tightly soldered up. A piece of thin brass tube a little over an inch in diameter was then cut to shape and soldered into position, a thread being cut on the outer end of it to receive a threaded ring watch glass and packing, as shown in the sketch. The tube required careful cutting out to fit accurately in place on the



Aluminium clip on side member of rear stand.

lubricator, and the repair should not be attempted unless one is a tolerably good metal worker.

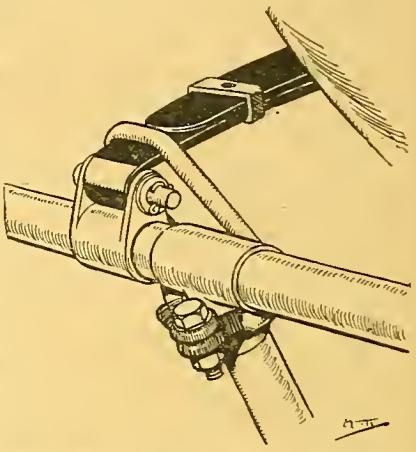
Lubrication.

The Scott is an exception to most two-stroke engines on the score of oil consumption, as the cylinders are water-cooled, and with careful driving 200 miles to a quart of oil (riding solo) can be accomplished. One must confess, however, that strict attention must be paid to the sight feed to obtain this figure. The writer uses bulk oil of good quality at 1od. a quart and feeding it at twice the rate, with very little extra expense. As one would expect, the engine runs remarkably well on this overdosing, which, moreover, seems to keep the piston rings free in their slots for a considerably longer period than usual. Reliance plugs have, so far, remained absolutely reliable. The lubricant used is the standard car engine oil generally kept in bulk in garages, but the buyer must beware of inferior stuff that is occasionally palmed off by unscrupulous people.

The oil feed pipes should be periodically unshipped and cleaned out, and if the radiator is taken off and returned at any time care should be taken to see that the rubber connections are free from kinks, which hinder the water circulation. On this last point insulating tape wrapped around the joints and painted with Silico enamel will effectively prevent water leakages occurring at any time.

An illustration is given showing a small clip fitting attached to one of the side members of the rear stand on the machine. It is made of aluminium sheet, cut to shape, and sprung in place on the stand, and it is most useful in preventing the enamel from being scratched away when kicked down with the foot.

A sketch is also given showing the rubber thongs that have been slipped over the shackles of the leaf springs on the sidecar to prevent bounce of the body when unloaded. The thongs are those fitted to doors in order to keep them shut, and were purchased at an ironmonger's for two or three shillings. They were simply slipped over the springs and part of the chassis and the "eyes" secured together with a 3/8in. nut and bolt.



Anti-rattle rubber thongs over sidecar leaf springs.

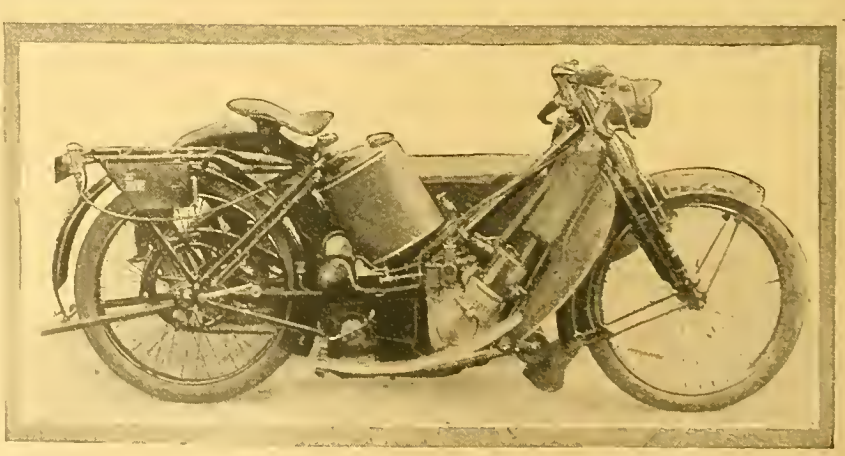
The sidecar fitted to the writer's machine is a sporting model Canoelet, and it is most comfortable. A fourth point coupling to the machine has been added, and the body painted in Scott purple enamel, thus rendering the whole outfit a very smart affair. The sidecar is light in weight and makes no perceptible difference in the speed of the machine, and the petrol consumption works out at approximately 65 m.p.g. on a straightforward journey. M.A.M.

WOODCHUCK REDIVIVUS.

How many strokes would a two-stroke stroke if a four-stroke could stroke two?

A two-stroke would stroke all the strokes it could stroke if a four-stroke could stroke two.

LIEUT. C. H. T. ALSTON,
Inventor of the Premier two-stroke engine.



A Scott sidecar outfit, referred to in the accompanying article.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Two-stroke Comparisons.

You would oblige me very much by answering the following queries: (1) Given two machines of same horse-power, one four-stroke, the other two-stroke, and of same weight, does the two-stroke machine consume much more petrol than the four-stroke? (2.) Am I correct in thinking that the two-stroke machine, because of the greater number of explosions in a given time, could mount a hill much easier than a four-stroke engine of same horse-power and same weight?—T.D.

(1.) A two-stroke machine will consume slightly more petrol than the four-stroke machine of the same horse-power and weight. This state of affairs is easily accounted for, inasmuch as the two-stroke type of engine has to perform twice the number of power strokes over a given distance. (2.) Your surmise that a two-stroke machine will mount a hill more easily than a four-stroke machine of the same horse-power and weight is quite correct. This is a special virtue of the two-stroke engine.

Increasing the Gear Ratio.

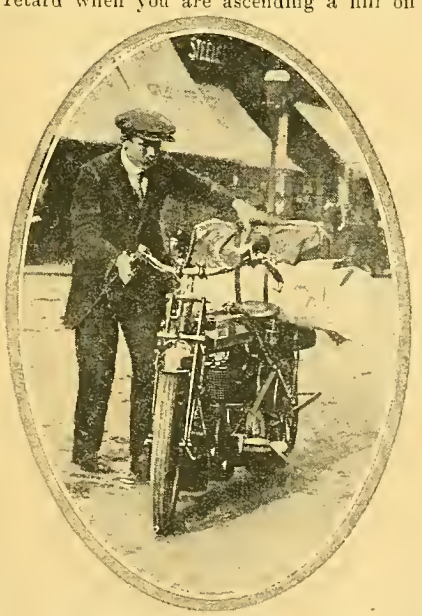
I have a James 2¼ h.p. two-stroke, two-speed, 1915 model, geared 5½ and 10 to 1. I am wondering if it would be advisable to raise the gears by enlarging the pulley to, say, 4 and 7½ to 1. I find that I never have to use the low gear, even on very steep gradients. I am practically a beginner, and would like your advice before making the alteration. (1.) Would this arrangement tend to give a cooler engine? (2.) Would there be less wear and tear of the engine? (3.) Would there be less strain on the belt? (4.) Would speed and petrol consumption be about the same? I may say that I average 25 m.p.h., and run about 100 miles to the gallon.—J.G.

We see no objection to increasing the gear as the engine climbs so well on top speed, but do not go too far. 4 to 1 strikes us as being too high. (1.) The engine would keep cooler with a higher gear. (2.) Also, provided that the engine were not overloaded, there would be less wear and tear. (3.) The strain on the belt would not be appreciably affected. (4.) The petrol consumption would be slightly improved, and the speed perhaps greater on the level, though raising the gear does not always increase the speed.

The Effect of Varying the Timing.

(1.) Would you be kind enough to explain briefly to me the idea of retarding and advancing the spark? (2.) When is it convenient to retard and advance the spark? (3.) I should feel much obliged if you would tell me why the front cylinder of a 6 h.p. twin engine does not receive the required amount of lubrication, yet the back cylinder seems too well fed?—S.H.M.

(1.) You will find the matter fully dealt with in "Motor Cycles and How to Manage Them," which can be obtained from these offices, price 1s. 2d. post free. Briefly, it is this: That the farther advanced is the spark the greater the power of the explosion, owing to the fact that this occurs at the highest point of compression; whereas, with a retarded spark, the explosion occurs at a point when the compression is not so high, consequently the explosion is weaker. 2.) Generally speaking, the spark should be kept as far advanced as possible, taking into consideration the conditions under which you are travelling. You only retard when you are ascending a hill on which the engine shows signs of labouring. (3.) This is largely governed by the direction of rotation of the flywheels, which tend to throw up the oil into the back cylinder, with the result that the front cylinder is somewhat starved. The trouble is overcome in many cases by introducing the oil direct to the front cylinder.



The motor cycle of a newsagent. The owner rides every day a distance of twenty miles to get his stock of newspapers, which is strapped on the carrier of the B.S.A.

Cams.

Could you give me the correct shape for the inlet and exhaust cams of a 3½ h.p. engine, also the correct lift and timing?—E.H.T.

It is outside our province to design cams and other engine parts. You do not tell us what result you wish to obtain from the cams you propose fitting. Roughly, it may be stated that for racing purposes a quick lift and long opening are desirable, but cams of this sort are inclined to be noisy. Therefore, for ordinary purposes a more gradual lift and drop is preferred. The valve lift on your engine should be from $\frac{3}{16}$in. to $\frac{1}{4}$in., and the valve timing should be approximately as follows: Exhaust valve opens when the crank is 45° from the bottom of the firing stroke, and closes on top of the exhaust stroke or very slightly after. The inlet valve opens as the exhaust closes or just previously, and remains open for approximately 180°, or one complete stroke for the piston.

Fitting a Drip-feed.

(1.) My machine is a 3½ h.p. T.T. model, and has ordinary pump lubrication. Would it be advisable to fit a drip-feed, and is this method reliable on such a machine? (2.) What is the average number of drips per minute? (3.) Will a wired-on tyre stand a retread?—A.F.J.

(1.) The modern drip feed is just as reliable as a pump; in fact, it is not infrequently a combination of the two, as by adjusting the drip regulating screw you may either set the lubricator to give so many drops per minute, or you may open it fully and put a full pumpful into the engine. (2.) The number of drops per minute is regulated according to the speed; for instance, at 20 m.p.h. you may give thirty drops per minute, or even fewer than this, while if you are really going hard you may let the oil run in a thin continuous stream. (3.) A wired-on tyre should stand a retread as well as a beaded tyre.

Two-stroke Rattle.

I should be very glad if you would answer the following: I have a 1915 two-stroke machine of 2¼ h.p. At speeds of twenty miles per hour the engine develops an alarming rattle, which I have traced to a badly worn big end. The machine has only run 370 miles, and is oiled on the petroil system—one breakfast cup of oil to one gallon of petrol. What do you advise to prevent a recurrence of this trouble, when rebushed?—J.W.H.

It is just possible that a faulty big end may have been fitted in the first instance. In any case, to avoid a similar occurrence of the trouble, lubricate with a copious supply of oil, *i.e.*, use a ratio of 1 to 14.

No Power.

I bought a two-stroke motor cycle last April, and have ridden under 200 miles so far. Recently I have been troubled with a metallic knock, not so much like engine knock, but more as if the mudguard or tank were being thumped. Recently, too, this has been accompanied by the engine getting rather hot, and by the machine slowing down and refusing to accelerate again, and finally stopping. If I slow down at a corner and then open the throttle the machine knocks a bit and then stops. I have soaked the engine with the oil recommended by the makers, giving it as much as it would take without four-stroking. Also it has lately been almost impossible to wheel the machine with the compression released, but after squirting paraffin into the cylinder it will go all right for a mile or two. The magneto timing is quite correct, and I have tightened every nut on the machine. My theory is that the oil must have stuck up the piston to such a degree that the engine has had to slow down, and, at slow speeds, to stop. This would explain the overheating and the effort to push the machine. Will you please tell me your opinion, and if like the above, why should it go all right for 150 miles before gumming up? As regards the knock, it occurs mostly when starting, and is less in evidence at high speeds. All nuts are tight, and I can find no loose parts. Would any harm result to an engine which is very oily being run four miles without oil? This I did some time ago, it being quite an oversight. The carburetter gives me only 60 m.p.g., and I can drive with the air fully open at all speeds. Would it not be better to give extra air, and is there any means of doing so?—F.W.C.

We should advise you to take the cylinder off your engine and carefully clean the cylinder head and the valve ports. Also examine the piston rings. It is very probable that you will find the top one stuck in its groove, in which case it should be very carefully removed with the help of paraffin. The plug may be at fault; try a single point plug with thick electrodes. It is very likely that running a machine for four miles without oil would do some damage, though if, as you say, the engine was very oily at the beginning the damage may not be serious. If cleaning does not improve the running, we are of opinion that the piston is warped, possibly owing to the engine having been run without oil, which would cause excessive heat. In this case, it must be submitted to the makers. You would get better consumption if you fitted a smaller jet, but this must not be too small or you will have difficulty in starting.

Low Registration Number.

As I am having a new mount, and the registration numbers in Swansea have now gone up to four figures, I should like you to tell me if I can register in another county or borough, where low numbers may be obtained.—J.P.W.

You may register in any county. We should recommend you to apply to the Clerk of the County Council, Darlington, where you might possibly get a low number, or to the following Irish counties: Monaghan, Carlow, Clare, Donegal, or Fermanagh.

Slow Running.

I have recently purchased a 3½ h.p. motor cycle, to which I fitted a 1914 Senspray carburetter, 34 jet. The machine starts at about 10 m.p.h. Can you give me the correct size of jet to use, as this is far too fast for me, not being in any way an expert? The slides are properly adjusted according to the makers' directions.—J.S.J.

It is as well to bear in mind that engine tune has a great effect upon slow running; in fact, just as much so as a correct carburetter setting. The chief points to watch so far as the engine is concerned are—cleanliness, correct strength for valve springs and a tappet clearance of not more than $\frac{1}{100}$in., a good single point plug adjusted to .4 mm., a correctly adjusted magneto contact breaker, and a squarely trimmed up high-tension carbon brush. Great care must be taken to prevent air leaks in the inlet pipe.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"L.K.G." (Brighton).—A.B.C. 1915 T.T. and touring model for solo work. Reliability, range of speed, hill-climbing, durability, upkeep, wear on tyres, and efficiency.

"S.L." (Coventry).—650 × 65 Dunlop grooved tyres for heavy passenger combination. Durability and freedom from skidding.

LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost" and "Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and all that are notified to us are inserted in this list. Should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication, but it must clearly be understood that we cannot enter into correspondence on the matter beyond this.

ROUTES.

ILFORD TO BUDE.—H.G.R.

Through London *viâ* Bow, Whitechapel, Embankment, and out to Hounslow, Staines, Basingstoke, Andover Salisbury, Bishopstone, Broad Chalks, Shaftesbury, Sherborne, Honiton, Exeter, Okehampton, Hatherleigh, Holsworthy, to Bude.

TAUNTON TO AYR.—J.O.B.

Taunton, Bridgwater, Highbridge, Bristol, Almondsbury, Stone, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitchurch, Tarporley, Warrington, Wigan, Preston, Garstang, Lancaster, Carnforth, Kendal, Penrith, Carlisle, Annan, Dumfries, Corsock Bridge, Balmaclellan, Dalmellington, Ayr.

SUNDERLAND TO BIRMINGHAM; also mileage.—W.H.D.

Sunderland, Durham, Darlington, Northallerton, Thirsk, Topcliffe, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Tickhill, Worksop, Mansfield, Derby, Burton-on-Trent, Lichfield, Sutton Coldfield, to Birmingham. Approximately 210 miles.

PORTSMOUTH TO LONDON, avoiding, if possible, roads cut up by military traffic.—H.A.T.

Portsmouth, Cosham, Petersfield, Farnham, Hog's Back, Guildford, Ripley, Kingston, to London. This avoids the bad stretch of road between Godalming and Hindhead; the road is fairly good.

KEARSLEY (LANCS.) TO GOLSPIE (SUTHERLAND).—A.G.

Kearsley, Bolton, Horwich, Chorley, Preston, Garstang, Lancaster, Kendal, Penrith, Carlisle, Gretna Green, Lockerbie, Crawford, Abington Inn, Symington, Lanark, Carluke, Cumbernauld Station, Denny, Stirling, Dunblane, Auchterarder, Perth, Dunkeld, Ballinluig, Pitlochry, Blair Atholl, Dalwhinnie, Kingussie, Carrbridge, Inverness, Beauly, Dingwall, Bonar Bridge, to Golspie. A considerable part of the journey could be cut off by going through Evanton and across the hills to Bonar Bridge.

ABERDARE TO BRIGHTON, avoiding traffic as much as possible.—G.R.

Aberdare, Pontypridd, Caerphilly, Newport, follow Chepstow road turning right to Severn Tunnel Junction, and training to Pilning (railway company handle motor traffic well), Mangotsfield, Bath, Beckington, Warminster, Hertesbury, Salisbury, Stockbridge, Winchester, Brandean, Petersfield, Midhurst, Pulborough, Steyning, Brighton.

WOLVERHAMPTON TO CHIPPING ONGAR (ESSEX); also approximate distance.—H.J.B.

Wolverhampton, Kingswinford, Stourbridge, Bromsgrove, Alcester, Stratford-on-Avon, Banbury, Aynho, Bicester, Aylesbury, St. Albans, Hatfield, Goff's Oak, Cheshunt, Waltham Abbey, Epping, Ongar. Approximately 150 miles.

MOTOR CYCLES FOR SALE.

Auto-Wheels.

AUTO-WHEEL, B.S.A. de Luxe, 1914, for sale, very little used; £10/10.—J. Andrew, Church St., Berrie. [X1727

WALL Auto-Wheel; £14/14 cash, or 26/8 down and 26/8 monthly.—Seen at 248, Bishopsgate, London, E.C. [1712

AUTO-WHEEL and Enfield 3-speed cycle, 26in., good condition; 10 gns., or separate, 7 gns.—White, 12, Oakhill Rd., Sutton, Surrey. [8763

WALL Auto-Wheel, 1913, little used, good running order, all accessories; 10½ gns.—Hill House, Wotton-under-Edge, Glos. [8844

AUTO-WHEEL, 1914, practically new, ridden under 10 miles, fitted gent's Royal Eagle, extra heavy tyres; 20 gns.—42, South St., Romford, Essex. [8732

AUTO-WHEEL and James Tricycle, gent's 22in., with Hucklebridge attachment; new, actually in stock; £33/11.—Hucklebridge, 133, Sloane St., London. [X1878

AUTO-WHEEL de Luxe, 1914, in perfect condition; £8/10; owner buying car, hence sacrifice; seen any time.—R.R., 11, Pembridge Crescent, Notting Hill Gate. [8722

TWO 1914 Auto-Wheels in first-class order, £9 each, or one with special B. and B. carburetter, £10; or with 3-speed Raleigh, 22in. cycle, £15.—Crow Bros., 190, High St., Guildford. [8909

AUTO-WHEEL, Model de Luxe, £15/15, new March, 1915, with shock absorber and 11/6 rear lamp, rider selling on account of ill-health; accept 10 gns.—Johnson, Portscatho, Cornwall. [8795

Bat.

BAT, 2¾h.p., spring frame, h.b.c., low, reliable; £7.—24, Lister St., Rotherham. [8738

4h.p. Bat-Jap, spring frame, variable gear, as good as new; £22/10.—Murphy, Green View, Tralee. [X0452

6h.p. 1912 Bat, single gear, Whittle, F.R.S., etc., nice condition; £26.—Harvey, Hudson and Co., South Woodford. [X1888

1914 4½h.p. Twin Bat-Jap, 2-speed, speedometer, Lucas horn and lamps, Amac, done 4,000; £46.—Bowyer, Grosvenor Lodge, Twickenham. [X1815

BAT-J.A.P., late 1913, 7-8h.p., 2-speed, clutch combination, £55; large deposits secure preferential terms.—Lamb's, 151, High St., Walthamstow. [8776

BAT-J.A.P., 1912, 3½h.p., single gear, in excellent condition; £21/10.—The Exeter Motor Cycle Co., Ltd., 7, Bath Rd., Exeter, and 28, Tavistock Rd., Plymouth. [0569

BAT-J.A.P., 1913, 6h.p., underslung coachbuilt sidecar, 2-speed, chain drive, F.R.S. lamp set; £48.—W. E. White, Three Jolly Weavers, 94, Lever St., Goswell Rd., E.C. [8779

LATE 1914 6h.p. Bat-Jap, coach sidecar, 3-speed, kick start, speedometer, Lucas lamps, all accessories, splendid combination, like new, cost over £100; accept £63.—436, Whitehorse Rd., Thornton Heath. [8799

BAT, 6h.p., October, 1913, 3-speed, kick-starter, and 1914 Swan sidecar, lamps, horn, spare inner tubes, belt, etc., hardly used since war, thorough overhaul by makers last April, excellent condition; 45 gns.—Lieut. Thursfield, Torpedo Boat 113, Sheerness. [8928

BAT, 1913, 5-5h.p., spring frame, 2-speed, chain driven, only run 3,000 miles by careful rider, luxuriously fitted 3-ply coachbuilt light sidecar, special luggage carrier, ideal outfit for touring; £60; with accessories cost £104.—J.W.M.G., Box 19354, Haddon's Advertising Offices, Salisbury Sq., E.C. [8752

Bradbury.

BRADBURY, 4h.p., and sidecar, lamps, horn; £24.—54, Rathfern Rd., Catford. [8880

BRADBURY, 1913, 4h.p., 2-speed, free engine, and sidecar; £30.—29, St. Leonards St., Bow. [8857

4h.p. Bradbury and Coach Sidecar, N.S.U. gear, grand condition; £32.—Harper, Craven Arms, Salop. [X1960

BRADBURY 1915 Models, lists free.—Agents, Bright and Hayles, Church St., Camberwell. [8917

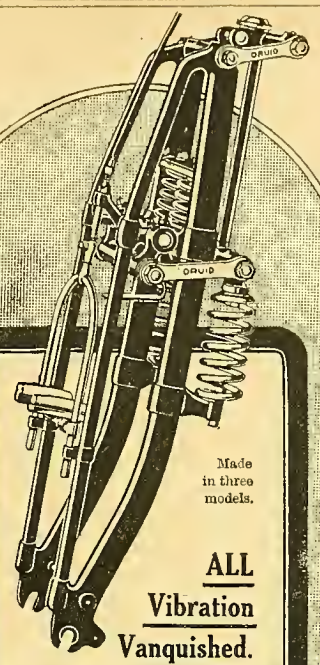
3½h.p. and sidecar, 2-speed, free engine, Whittle belt, mag., good maker; £25.—515, Kingsland Rd., Dalston, N.E. [8783

5h.p. Twin, with sidecar, good running order, 2 speeds, mag.; price £22.—H. Mitchell, 100, Lillington St., Westminster. [X1394



Made in three models.

ALL Vibration Vanquished.

The DRUID MARK II. is essentially THE Fork for providing the complete insulation of the Rider from ALL Vibration.

CORRECTLY designed—and exclusively so—it offers a "shock-absorbing" service which entirely eclipses that of any other springing device on the market.

The DRUID MARK II. absorbs both Horizontal and Vertical Shocks and fulfils ideally EVERY function of the PERFECT double-acting Spring Fork.

It sets up no objectionable "dithering" action, so common with the ordinary Spring Fork—eliminates risk of breakage or accident—provides remarkably comfortable riding—and makes the machine last longer.

Now, fit the "DRUID" to your present mount, or INSIST on its presence in your New Machine.

Fuller details with pleasure.

A. DREW & Co., Ltd., Leopold Street, BIRMINGHAM.

MOTOR CYCLES FOR SALE.

Miscellaneous.

HEBDEN'S Have in Stock:

1915 Enfield 6h.p. Combinations, 3h.p. and 2¼h.p. lightweights.

THE CREAM OF MOTOR CYCLING KNOWLEDGE UP-TO-DATE

is contained in the Fourth Edition (Revised) of

HINTS & TIPS FOR MOTOR CYCLISTS

ON SALE EVERYWHERE.

Hundreds of little "wrinkles," gathered from the experience of many years of riding, and useful to every motor cyclist, are contained within the covers of this book.

Price 1/- net. By post 1/2.

From ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C., and all leading booksellers.

"One Advertisement in THE MOTOR CYCLE is worth half-a-dozen in any other paper"

—see below.

Buchlyvie,
Stirlingshire.

"I have had several advertisements in your paper, and each has been a great success. A short time ago I advertised an F.N. engine, and as a result spent quite a small fortune returning postal orders. It was sold by wire the day 'THE MOTOR CYCLE' was published, and about six weeks afterwards I had an enquiry from India. One advertisement in 'THE MOTOR CYCLE' is worth half-a-dozen in any other paper."

JOHN W. WALKER.

SIDECARS AND FORECARS.

PHŒNIX Sidecars from £4/17/6 to 14 gns.; write for catalogue, fully illustrating the various models.

PHŒNIX Sidecars.—Special models to suit Indian and Douglas motor cycles.

PHŒNIX Sidecars.—See our latest design underslung chassis, coachbuilt sidecar; 10 gns.; easy terms arranged.

PHŒNIX Sidecars.—We are also making a special coachbuilt sidecar; £8/15.

PHŒNIX Sidecars on hire; exchanges made; good prices allowed for other makes in exchange.

Rear Springing.

DURING *The Motor Cycle's* career a number of campaigns have been launched in its pages to give stimulus to the production of some particular article or fitting in connection with the motor cycle, the need of which has been clear to our minds. For instance, the change-speed gear was many years ago seized upon by us as a fitting more likely than anything else to popularise the motor cycle. We therefore expressed our opinion both regularly and persistently, and made it a practice to review from time to time the different types of speed gears as they were evolved. The early gears were of the two-speed variety without exception, but gradually and surely improvements came hand in hand with the experience gained, until the change-speed gear of to-day is as reliable as any other portion of the motor cycle. Similarly *The Motor Cycle* can lay claim to having brought about the standard adoption of spring forks, footrests, stands, and carriers. Nowadays one would never dream of purchasing a machine without a stand and carrier, yet it is not many years ago that buyers had to purchase these articles separately and fit them to their machines. Now it seems to us that we have reached a stage when the comfort (or otherwise) of motor cycles is the point upon which the brains of designers must be concentrated. Obviously we refer to the crying need for the more general adoption of spring frames, or at any rate spring footrests and saddle pillars. Already we have excellent spring forks absorbing shocks produced by road inequalities on the front wheel, but the discomfort to the rider by reason of the absence of springs on the rear portion of the machine is very pronounced. We have urged the desirability of spring frames for some years past, but, strange to say, British manufacturers have taken but a lukewarm interest in them. Our reason for returning to the topic, doubly convinced that the adoption of spring frames is a desirability of the future, is the rapid deterioration of our roads due to military traffic. For some months past we have made it a practice to record the stretches of road which a motor cyclist would be well advised to avoid, and the list has now grown to such an extent that it confirms the suspicions we have had for some months that the roads of this country may not, unless a reformation takes place, be a paradise for motor cyclists. Of course, the military traffic is not wholly to blame: the opening of so many motor 'bus routes and the increase in that juggernaut of the road, the steam lorry, have caused a tremendous destruction of the road surface.

A spring frame on a motor cycle is not perhaps so easy to devise as one may suppose when first considering the subject. The majority of existing devices are very unsightly, but mere unsightliness cannot in itself be considered a real objection. What is required is (1) a springing system allowing easy movement without rebound. (2.) Invariable distances between driving centres. (3.) Lateral rigidity. (4.) A minimum number of joints. (5.) The drive must be unaffected by rise and fall of the wheel. (6.) Not much increase of weight.

The above is a bold specification, but the objections should not be insuperable. There are many designs which have already been evolved, which fail only in one or two particulars, but by a combination of ideas the ideal spring frame should be attainable. We therefore urge manufacturers to devote attention to this pressing problem. Were the leading British makes of motor cycles fitted with a spring frame as standard there is no doubt that there would be few rigid frames sold. Consequently those smaller firms who wish to shine cannot do better than devote their attention to the production of an efficient spring frame.

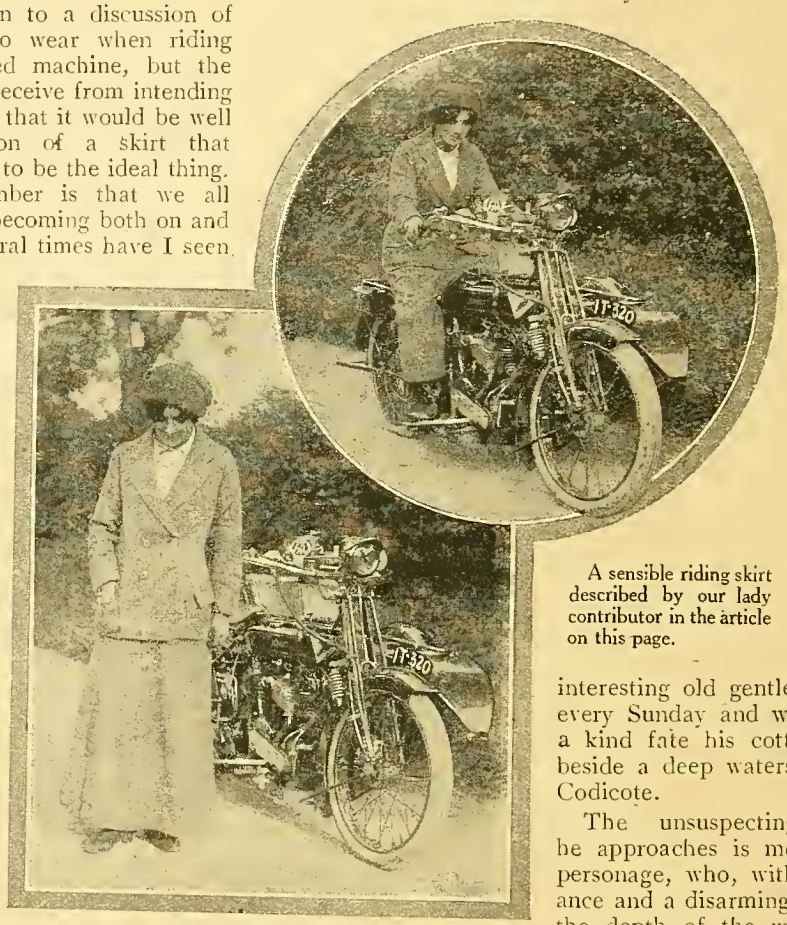
In this issue we publish an article on springing systems in general, reviewing the points to be aimed at, and illustrating some typical designs which should provide food for thought.

An index to the advertisements in this issue will be found on the page facing the back cover.

THROUGH FEMININE GOGGLES.

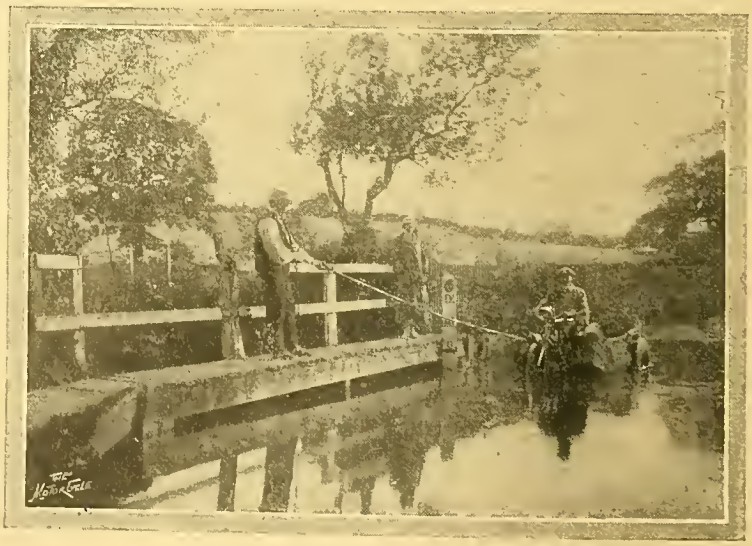
A GOOD RIDING SKIRT.

I AM loth to return to a discussion of the best skirt to wear when riding a diamond-framed machine, but the enquiries I regularly receive from intending riders make me think that it would be well to give a description of a skirt that experience has shown to be the ideal thing. The point to remember is that we all prefer a skirt that is becoming both on and off the machine. Several times have I seen illustrated designs of which complication seems the dominant feature. These only serve to deter prospective lady motor cyclists from taking up the pastime. The accompanying photographs will serve to show the type of skirt I prefer. It is an ordinary hobble skirt of tweed material made with buttons up the centre front. If about a dozen are used, the lower eight should be made to unbutton. Any tailor can supply this garment, or almost anyone handy with the needle can make it without the need of a special paper pattern.



A sensible riding skirt described by our lady contributor in the article on this page.

When the novice is called upon to specify details for her first machine, the various makes of carburetter and other fitments are confusing. However, there are refinements which, in my opinion, are worth the slight extra cost involved. For instance I recently had a pair of Terry spring links fitted to the head of the front forks of my machine, and they have proved a great success. The resiliency given when driving a high-powered outfit is worth the additional outlay. No vibration is carried to the arms from the front wheel.



Towing a sidecar outfit through a deep watersplash.

A few days ago I was searching a motorists' emporium to find the hooter most to my taste and worthy of my 1915 sidecar combination. Many were the weird and awesome sounds emitted from the mechanical contrivances offered. Doubtless they would clear any traffic, but, much as I should appreciate a change from the usual note, I felt it would be more ladylike to run over people!

Towing a Business.

Near Welwyn an interesting old gentleman spreads his web every Sunday and week-day evening. By a kind fate his cottage has been placed beside a deep watersplash on the road to Codicote.

The unsuspecting motor cyclist as he approaches is met by this benevolent personage, who, with a guileless countenance and a disarming sympathy, points out the depth of the water on the roadside measure provided by the A.A., and makes his helpful suggestion in something like the following terms: "Well, now, if you like to wait till I get a bit of rope, I'll tie it on to your sidecar, and you can sit on the motor and steer it across while I pull. The lady in the sidecar can walk across the bridge." Slightly amused, one accepts the proffered help, quite certain, when one sees the thickness of the rope and the ingenious way in which it is attached to the outfit, that it is not the first time that sixpence has been gained by this means.

MAY WALKER.

Finicky Chain Cases.

Here's another grumble. It is not a difficult matter to encase an engine chain by means of a substantial cast aluminium cover attached by half-a-dozen decent sized screws. But many makers continue to fit bendy contraptions made of sheet iron, or a similar flimsy material. I inspected a machine last week which, amongst other defects, was disfigured by a tin chain cover made in three parts. The outer and inner sides of the cover snicked into each other by means of very light-tongued metal projections. The pair when once engaged (no short or easy job!) were secured to the crank case by yet a third shapeless and bendable piece of tin, on to which they fitted by still more bendable grooves and tongues! A worse design it has never been my misfortune to strike. What's the matter with cast aluminium? It ought to be cheaper, and is certainly a thousand times less troublesome. It speaks much for motor cyclists that we are not known as the most profane and irascible class in the community.

British Magnetos.

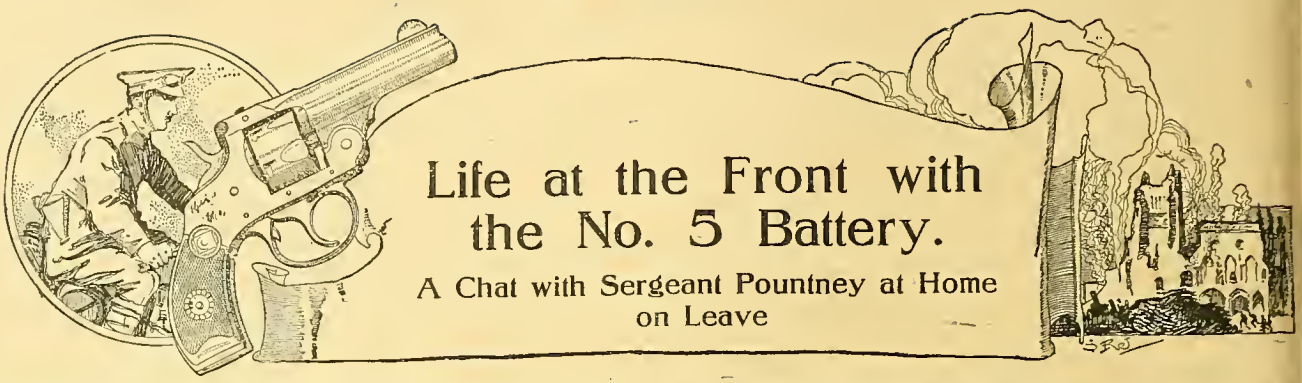
The main impression made on the mind of a patriotic business man, after reading the magneto makers' replies to our Editor's circular (see issue of July 1st), is that too many cooks spoil the broth. Price questions have always been the chief obstacle in our competition with Germany and America in the production of magnetos; and price questions are very intimately connected with output. Now the sum total of the British demand for magnetos is absurdly small; and a manufacturer who is competing with:

(*a*) The American magneto makers
(*b*) The German magneto makers
(*c*) A score of small British magneto makers

can hardly hope to secure annual orders for more than about a fiftieth of the British trade, even if his instrument is as good and as cheap as any rival's; and on this range of output he can hardly hope to keep his prices down to the figures attained by a rival—probably foreign—who has nine-tenths of the trade in his hands. The war may alter matters; but, personally, I do not believe that anti-German prejudice will continue to be a very formidable factor for more than a year after the war ends. If Germany is mulcted in colossal indemnities, taxation will smother her export trade to a large extent; but in that case America will simply replace Bosch as a foreign competitor whose advantage is based on huge outputs. A tariff might level up matters, but there are few signs of tariffs in British politics as yet. The outlook of the British magneto manufacturer is, therefore, far from rosy. In the meantime, there is one obvious step, which could be taken, and should be taken, viz., the association of all British magneto makers into a single large combine, with a united staff, a single factory, and a single policy. At present each of the numerous small concerns is wasting a huge amount of money on establishment charges, and an economy of at least 25% is possible if their factories and offices and staffs are amalgamated. Even then it is a very open question whether they could hold their own against Germany and America after the conclusion of peace, unless they are further aided by Government protection in some form. The marvel to me is that they think it worth while to enter upon a new industry under such conditions. I want to add that I have bought five magnetos this year, three American and two British, and that the British are infinitely the better, so far as workmanship is concerned.

Increasing Weights.

The weight of the average tourist mount is being increased very perceptibly. The last time my eagle eye was concentrated on the scales in a big garage prior to an important trial, the competition 3½ h.p. roadster, ready equipped for six days, scaled from 230 to 280 lb. Bigger tyres, stronger frames, and bulkier fittings are all piling on the load, and the countershaft gear box and combination or all-chain drive are far heavier than the belt and three-speed hub. The other day I weighed four machines, all equipped by sane and normal owners for ordinary use. A 4 h.p. combined drive twin, with countershaft gear, scaled 325 lb., including a lighting dynamo. A 2¾ h.p. T.T. twin tipped the beam at 212 lb. A 3½ h.p. with combined drive and countershaft gears, scaled 298 lb. The most creditable machine of the quartette, judged on this factor at any rate, was my own 3½ h.p. M.A.G.-engined Motosacoche, which, complete with a lighting dynamo set, weighed no more than 197 lb., and is, nevertheless, quite sturdily constructed, its chain case being the only noticeably light element in its make-up. If this tendency continues, it can only have one result; the big singles and small twins will gradually become constricted to sidecar or combination use, and the 2¾ h.p. will slowly replace them for solo work. The tendency is admittedly unconscious. The trade has formed no deliberate intention to disqualify its 3½-4 h.p. patterns for solo work; it is merely strengthening and refining them with an eye to the double-purpose man, who wishes to see them better adapted for occasional sidecar work. In time the tendency may be balanced by another aim, exemplified by the 3½ h.p. 80 m.p.h. A.B.C. which I have on order, and which weighs but 150 lb. all on. Unless the trade wishes to leave the solo market to the smaller engines, it will have to develop two separate 3½ types, one intended for fast solo work, and the other planned for efficient sidecar service.



Life at the Front with the No. 5 Battery.

A Chat with Sergeant Pountney at Home on Leave

SERGT. J. H. POUNTNEY, who enlisted in the M.M.G.S. early in the year, has been home on leave, and one day last week we had a chat with him. Pountney belongs to the No. 5 Battery (the "Coventry Battery"), and crossed over to France early in March. After a short time at the base the battery was moved up to within three and a half miles of the firing line, and within sound of the guns. After further training some of the men became so anxious to taste the experience of trench life that they volunteered for trench duty, and it was arranged for one of the sections, with a couple of machine guns, to take a turn, and Pountney accompanied the section.

En Route to the Trenches.

Two of the quietest cars obtainable were used to run the party to the advance post, about threequarters of a mile from the reserve line of trenches. At this stage the excitement began, as they were under shell fire, but all members of the section crawled safely into the first line trenches. At the time mud was very prevalent, so the experience was not one to be easily forgotten if only on that account.

Serg. Pountney gave us some interesting impressions of trench life.

On hearing the whistle of a bullet or a thud the men automatically "duck," but it is a waste of time, as the bullet has by then long since past. This ducking is a habit which all new-comers have great difficulty in overcoming. It does not do to peep over the sandbags, as the German snipers are always on the watch, and are from time to time sweeping the top of the parapet with machine guns.

One of the many dirty habits of the foe is to reverse the bullets, so transforming them into dum-dums. One poor fellow of the No. 5 Battery, B. Chambers, was hit by one of these bullets and killed instantly. Only one other casualty has occurred to the No. 5, and that was Gunner Clarke, who was hit in the left lung whilst filling a sandbag.

All the sections have had their turn in the trenches, and none suppress the fact that they would prefer to tackle the Germans openly.

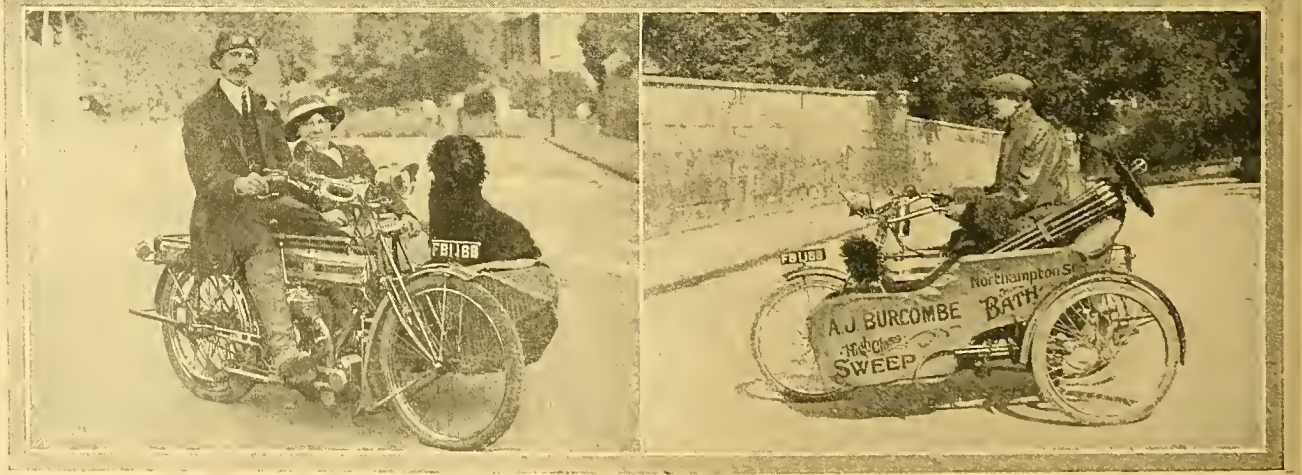
It is interesting to note how religiously the Germans shell the roads behind the British lines on which they believe the transports bring rations and supplies. Pountney's most exciting incident was in fetching rations with a party of the No. 5 Battery. Going *via* the open road for quickness, they were spotted, and a hail of machine gun and rifle fire followed them. One of the Connaughts with the party was shot through the bead; the others crawled back through the thick mud to get a stretcher party.

Members of the No. 5 Battery are very cool under fire, some of the men in particular seeming to enjoy the experience. A grim sight which some of the men will always remember was finding a German and a Gurkha locked in death grips in front of the trenches. Apparently after a hand-to-hand fight the German had clasped the Gurkha's throat in a last grip, and the Gurkha's knife was embedded in the German's stomach.

Sergeant W. A. Davenport has, unfortunately, had two illnesses, and his work has been performed by Ivor Chance (formerly with the Excelsior Co.).

Pountney emphasised the need of more and yet more men at the Front, and anxiously enquired about our recruiting work. He called on an inspection day, and saw sixty raw recruits being sworn in.

Major Alkin is no longer the commanding officer of the "No. 5," Captain Hammond having taken his place. Major Alkin is now in charge of a transport column.



A novel way of converting a sidecar for business use is shown in these pictures of a Triumph outfit belonging to A. J. Burcombe, who carries on a sweep's business at Bath. The same sidecar is used for both pleasure and business; for the latter, the cushion and apron are removed and the sidecar covered with a special waterproof canvas cover made at a cost of a few shillings.

The Increase of Motor Cycles in the London District.

FOR some ten years past it has been the practice of our contemporary, *Motor Traction*, to conduct enumerations of traffic annually at certain points in the Metropolis. The figures obtained are not without interest to our readers. The census of central traffic taken in Fleet Street was naturally not calculated to reveal any great use of motor cycles. Nevertheless, while the average number counted from 1907 to 1910 was only about four in the course of a day, the last census, taken in April of this year, had multiplied that number by ten.

Again, in the Edgware Road, the number of cycles, which averaged about ten a day from 1906 to 1908, has during the past three years averaged over eighty a day, these figures being obtained in the middle of

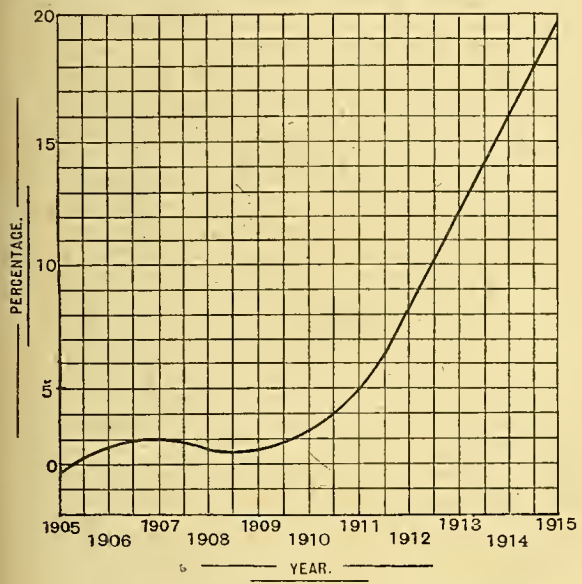


Fig. 1.—Putney Bridge Sunday cycle (pedal and motor) traffic, showing steady decrease of former and increase of latter since 1905. The decrease in the number of motor cycles in 1915 compared with 1914 is only to be expected, and is one of the many evidences of the great part motor cyclists are now playing in the defence of the country.

September of each year. They do not include motor carriers, which hardly figure at all in the results till 1912, when seven were counted. A surprising increase took place in the course of the next twelve months, the figure for 1913 being no less than fifty-one, and this increased to seventy-one during the census of September, 1914.

From our point of view, the Putney Bridge census, taken on a Sunday in summer, is the most interesting. Fig. 1 shows the cycle and motor cycle traffic at this point. It will be seen that the use of pedal cycles has decreased very steadily during the whole period. On the other hand, the use of motor cycles, which did not show much increase from 1905 to 1909, has gone up very rapidly since the latter date. The sudden drop at the end of the curve shows the effect of the war upon the use of motor cycles, and is something in the nature of an answer to those who would maintain that motor cyclists as a class have not borne their share.

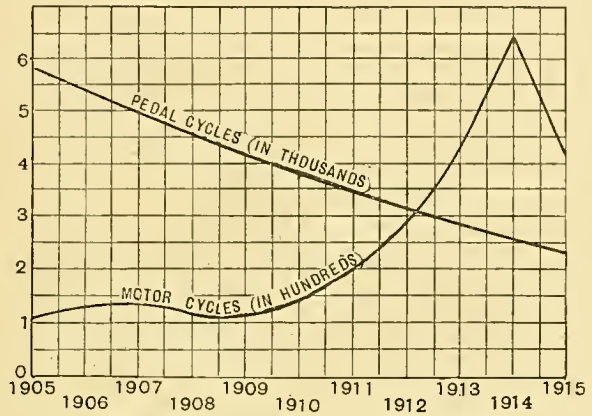

Fig. 2.—The progress of the motor cycle, as illustrated by the percentage of Putney Bridge cycle traffic "motorised."

Fig. 2, which also refers to the Putney Bridge results, shows very clearly how the motor cycle is affecting the use of pedal cycles. In 1905, the motor could only claim something less than two per cent. of the cycle traffic, but by 1915 its share had grown to about twenty per cent., and the shape of the curve indicates no probable diminution in the rate of increase for some years to come, unless it be due to an apparent set-back resulting from the abnormal conditions through which we are now passing.

FROM THREE WELL-KNOWN RIDERS.

WE have received the following letter from the Front: "Just a line or two from three of the boys to let you know that we are still going strong, and being now in our eighth month out here, during which time we have managed to stick together, with the exception of such times when we were sent out to the divisions or corps for a day or two. Although it is ride, ride, ride, from morn till night, we are still anticipating taking part in the next T.T. with as much enthusiasm as ever, provided we do not 'konk' out before, which we sincerely hope we shall not do.—HOWARD R. DAVIES (Sunbeam), GODFREY BOYTON (Triumph), and D. M. BROWN (Rover)."

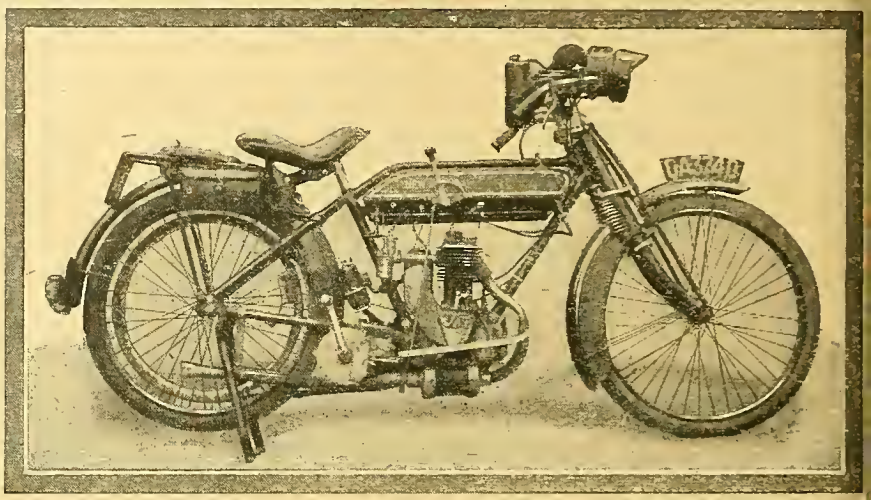
Former well-known competition riders—competitors in the last T.T. Race—who are now despatch riders at the Front. From left to right: D. M. Brown (Rover), H. R. Davies (Sunbeam), and G. Boyton (Triumph).

The Latest 2½ h.p. New Imperial.

THE New Imperial Co. have just produced a modified form of gear box complete with free engine and kick-starting mechanism for use with their light tourist model. This gear has been under test for some little time, and a few days ago we were invited to take a trip on a machine so fitted. The new gear is of the "dog clutch" variety, and provides two speeds. The dry plate clutch on the left side has five plates—two with cork insets. The kick starter mechanism is arranged on the opposite side, the sector and pinion being entirely enclosed.

With the help of the clutch, gear changing by means of the neat gate change lever and quadrant provided is greatly simplified, besides which the clutch is of such proportions that it is well able to move from rest a machine and rider of comparatively heavy weight. The gear is attached to the channel section bottom bracket by two studs and a corresponding plate fitting over the bracket.

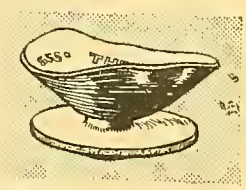
The 2½ h.p. New Imperial-Jap, with its 70 mm. × 76 mm. engine, is a wonderfully handy little mount, especially for traffic use. We were once again able to appreciate the value of such a machine from a business man's point of view by frequent stops and restarts during our trial. The ease of handling was largely contributed to by the controllability of the Zeta carburetter. The latest model New Imperial, we are glad to note, has an E.I.C. magneto, so that the New Imperial is now British in every detail from stem to stern.



Latest edition of the 2½ h.p. New Imperial, which is fitted with a countershaft two-speed gear, clutch and kick-starter. It is driven by chain and belt.

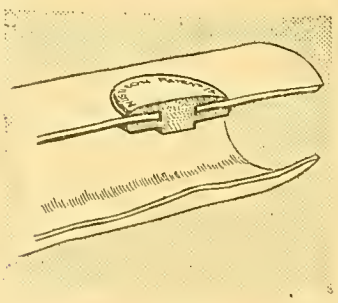
The Mustikon Tyre Repair Outfit.

A NEW and very effective method of dealing with punctures and small gashes has recently been introduced for motor cycles by Mustikon, Ltd., 20, New Street, Cardiff. The chief feature of the Mustikon system lies in the method of repairing a puncture from the inside of the air tube, so that it is practically impossible for the repair to develop faults during the whole lifetime of the tube.

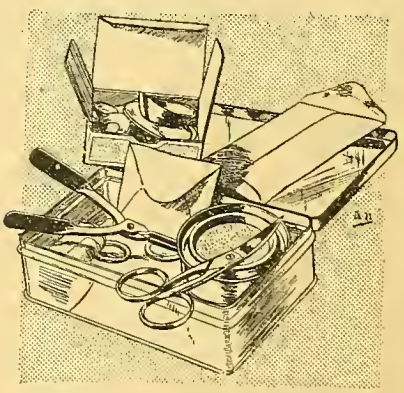


Mustikon repair stud.

The main feature is the stud, which consists of a small cup of rubber, below which is a rubber flange of approximately the same diameter; in starting on a repair the puncture orifice is enlarged to a certain size by a special cutter in order to receive the stud. After this the stud is held by a pair of special pliers, dipped in self-vulcanising solution, and simply pushed into the orifice in the tube. The outer or conical flange of the stud is afterwards given a coating of solution and pressed down on the outer surface of the tube, and the repair is finished.



Inner tube in part section, showing stud in position.

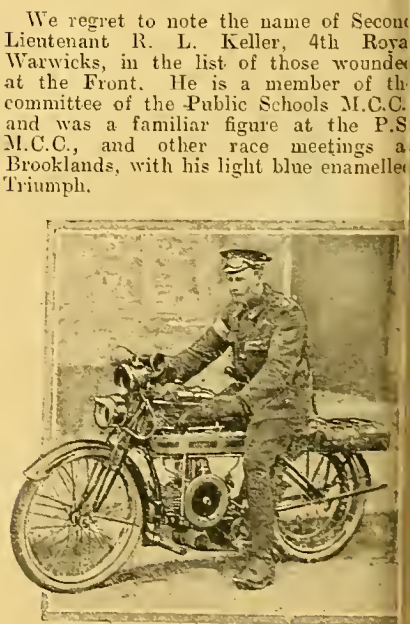


The Mustikon tyre repair outfit.

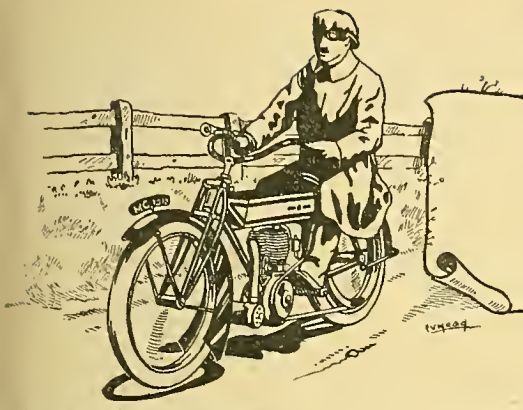
It will readily be seen that the air pressure tends to make the repair all the more effective, as the pressure in the tube keeps the inner flange of the stud up tight against the inner wall of the tube. Furthermore, it is claimed that heat generated by the tyre practically vulcanises the solution fixative, and thereby renders the repair additionally reliable. In an emergency the stud can be inserted without solution, and even so will make a fairly airtight joint.

Various size studs are supplied in the Mustikon outfit, including the necessary tools, solution, etc., and the price complete of the motor cycle outfit is 5s. 9d.

We regret to note the name of Second Lieutenant R. L. Keller, 4th Royal Warwicks, in the list of those wounded at the Front. He is a member of the committee of the Public Schools M.C.C. and was a familiar figure at the P.S. M.C.C., and other race meetings at Brooklands, with his light blue enamelled Triumph.



Despatch rider Corporal H. E. Hyett and his Douglas, on which he has put in some good work with the British Expeditionary Force in France, where the photograph from which our illustration is made was taken.



REAR SPRINGING.

By ERIC W. WALFORD.

IT would appear that the demand for improved springing is becoming a very pressing one, and most British manufacturers are finding that they are compelled to give serious attention to this subject in view of the fact that more than one machine on the market has for some considerable time been provided with rear spring suspension. This shows that it can be done, and that the clamours of the motor cycling community can and must be satisfied.

The problem is by no means an easy one, and considerable care must be exercised before adopting what at first may appear to be a satisfactory solution. The introduction of a spring between an axle, particularly a driving axle, and a frame introduces far more complications than would appear at first sight. I am not sure, therefore, that the best solution is not that of using a rigid frame and providing a spring support for the rider. The best known example of this kind is the Bat frame, which has been before the public for many years. I shall be describing this frame in further detail later, but, briefly, it may be stated that the frame is of the conventional type, but the seat-pillar and footrests are slung on springs.

Points to be aimed at.

An ideal spring suspension should prevent bouncing and be adjustable for load, and the motor car manufacturer is now giving attention to both these points, but possibly it is too early for the motor cycle designer to consider these features when there are many others far more important to be tackled first. It will not be out of place to specify the most important points in rear wheel suspension. These are:

(1.) The suspension must be stiff laterally to prevent rolling. It will be remembered that many of the early tricars were deficient in this respect. I remember breaking many a driving chain through taking a corner so fast that the consequent rolling of the body twisted the chain line.

(2.) There must be a minimum number of pivots, slides, etc., subject to wear. In some cases flexible spring plates can be used in place of pivot pins working in bushes, and later I will show a construction in which this arrangement is embodied.

(3.) The suspension system must not affect the tension of the belt or chain. With a rigid frame the distance between the centre of the engine, or countershaft, belt pulley and the rear wheel is always the same. With some systems of springing this distance varies as the suspension acts, causing variation in the tension of the belt, which should be avoided or made as small as possible. In any case loading of the frame should apparently reduce the tension in the case of a chain and increase it in the case of a belt.

(4.) The suspension should not be affected by the pull of the belt. If the distance between the pulley centres varies as the suspension moves it is obvious that the pull of the belt will tend to shorten the distance between these centres and cause the suspension to yield. The pull of the belt puts a separate load on the suspension, preventing it working properly. Thus the engine pull will tend to compress or release the springs, modifying their action considerably.

(5.) It must permit the use of a rear wheel brake, and some of the suggestions to which I am referring later would apparently prevent a rear wheel brake being used.

(6.) The suspension system must substantially resist driving and braking torque. This is a point very frequently overlooked by designers because the same difficulties do not arise in the case of a rigid frame. When the brakes are applied, there is an obvious tendency for the brake blocks to be carried round with the wheel. This is the braking torque. When the brake blocks are carried by a rigid frame, the support is obviously substantial and no difficulty is experienced. With a spring frame matters are very different, and it is important that designers should bear in mind this most important braking torque and make certain that the brake blocks, or the anchoring of the brake bands, are substantial and do not yield with the springs. Otherwise the braking torque puts a load on the suspension for which it has not been designed. In the case of a shaft-driven machine there is also a driving torque. The casing containing the bevel pinion or driving worm tends to rotate in the opposite direction to the road wheel, and the casing requires anchoring so as to resist this backward torque. In belt and chain drive, the driving torque is taken by the frame and can be ignored.

(7.) It must permit of constant mudguard clearance. It would look very unsightly to have a big clearance between the wheel and mudguard as is usual on motor cars. Such an arrangement necessitates a very wide guard increasing the weight, etc. The suspension must therefore enable the mudguard to be carried close to the wheel and to move with the wheel.

(8.) The attachment of a sidecar must be considered, and, probably, this is one of the most important points, so that manufacturers will be compelled to design their frames in order to take a sidecar; that is, to provide special points of attachment, otherwise users will fit sidecars in various ways, possibly interfering with and spoiling the suspension system.

Rear Springing.—

(9.) No construction is likely to be successful which adds very much to the weight or is very unsightly. Almost anything which is unconventional appears unsightly at first, but the objection on this score soon wears off if there are compensating practical advantages.

I think I have made it quite clear that the path is not easy for the designer, but it is well to point out the chief difficulties so as to show the motor cyclist that the solution of the problem is not a simple one, and this largely accounts for the fact that rear springing is not more general.

In order to find what different arrangements have been invented, I have examined the patent records for the past ten years or so, and I propose to illustrate a few constructions so that designers can see what suggestions have been made and how far these are applicable to modern requirements.

The systems shown are not necessarily very practical ones, but are chosen to illustrate the chief principles followed by inventors.

Some Patented Ideas.

The first construction (fig. 1) was proposed for a pedal cycle, and is of interest, as it shows the simple idea of fitting springs between the rear wheel

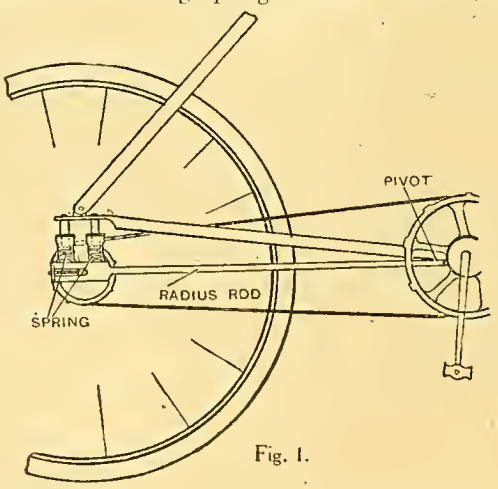


Fig. 1.

spindle and the adjacent part of the frame in conjunction with radius rods. Such an arrangement gives but little lateral stability, although it might be suitable for use on a pedal cycle, where the weights and speeds are low. To prevent roll, the wheel spindle must be supported at points as far as possible (up to 90°) from one another in a vertical plane.

Another simple construction, suggested for use on ordinary bicycles, is shown in fig. 2. The chain

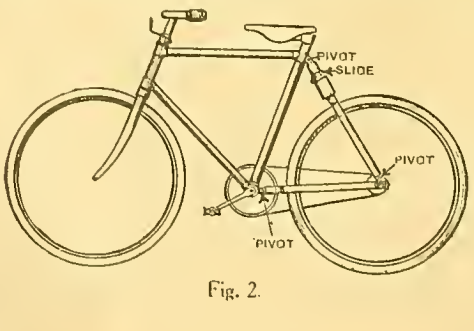

Fig. 2.

stays are pivoted to the bottom bracket, and the compression stays are telescopic just above the wheels, this telescopic part containing a spring. The compression stays are pivoted to the frame at the upper ends and to the chain stays at the lower ends. There are, therefore, six pivots as well as a slide. Similar arrangements have also been used experimentally on motor bicycles.

Another system which can be applied to a frame of the conventional type is shown in fig. 3, which

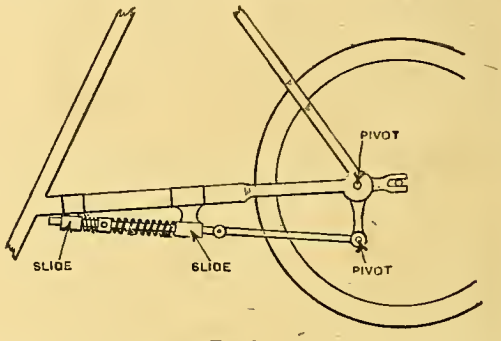

Fig. 3.

is almost self-explanatory. The wheel spindle is carried by a bell crank lever at each side, and these levers are pivoted to the ends of a fork, the left-hand end of which works in a slide on the frame against the action of springs. As soon as the axis of the rear wheel, the pivot of the bell crank lever, and the axis of the engine crankshaft move out of line when the spring yields, the pull of the engine puts a load on the spring and the belt slackens, which are objectionable features. It would appear difficult to fit a rear wheel brake and to arrange the mudguard so as to move with the wheel. Such "attachments" would not appear to be capable of fulfilling the chief requirements.

A particularly interesting system is illustrated in fig. 4. The wheel spindle is carried at each end by a vertical tube, which can slide in relation to the rear of the frame. These two sliding tubes are bridged across at the top and are supported on a leaf spring. This gives good lateral support, and

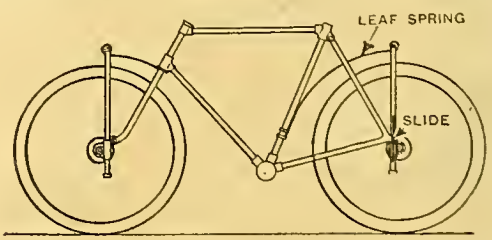

Fig. 4.

the design is simple, but slides are always objectionable, as the surfaces must always be partially and intermittently exposed, and consequently cannot be properly lubricated.

A construction which will be familiar to many is shown in fig. 5. The rear wheel spindle is carried by arms pivoted to the rear of the frame, and these arms are acted upon by springs arranged within a housing just beneath the saddle. This housing is pivoted to the frame at the top, and at the bottom it is connected with the arms by a fork member. The

THE NEW COUNTER-SHAFT

ROVER

Extract from Ireland's "Saturday Night":

RELIABILITY TRIAL IN CONNECTION WITH THE ULSTER CENTRE OF THE MOTOR UNION.

"George Graham (3½ h.p. Rover and Sidecar) was first . . . . . .

"I am sure that all his fellow-competitors will agree no better sport could have won the event than George Graham, whose new Rover covered itself with glory by the way in which it took all the test hills including the terror at Feestown. It was a supreme test of hill-climbing for a passenger mount of such moderate horse-power."

SIDECAR COMBINATION COMPLETE

£80 : 0 : 0

The Rover Co., Ltd., Meteor Works, Coventry.

Established 1897.

BOWDEN WIRE LTD.

LONDON

PRATT ST. N.W.

BOWDEN WIRE MECHANISM.
The only efficient method of controlling all movements from the handle-bar. Made in various streogths and finishes.

BOWDEN CONTROLS.
Levers for use with Bowden Wire for Brakes, Clutch, Air Inlet, Magneto, and other Controls. Straight or Curved, for right or left hand and for one to three movements.

STOPS, PORTABLE CLIPS,
Etc., and all necessary fitments for use with Bowden Wire Mechanism and Controls.

BOWDEN TWO-SPEED GEAR.
A very simple and highly-efficient countershaft gear with kick-starter. Can be fitted to a number of machines without any — to most with slight—alteratioo. Guaranteed for engines up to 6 h.p.

BOWDEN RAPID VALVE GRINDER.
Grinds a valve quickly, and with absolute accuracy, without dismantling the cylinder. Most efficient. Also useful as a Valve Spring Lifter.

Godbolds

JAMES HOWARTH, Proprietor.

Unsolicited Testimonial from the Front.

Base M.T. Depot Rouen, France,
20/6/15.

To the J.H. Motor Works, Oldham.

Sirs,—I am writing to state that for the short time I have ridden your J.H. 3½ h.p. Twin, it is only in justice to you to state that the machine has never given me a moment's anxiety, and really is, in my opinion, the ultimate machine for solo work on all kinds of roads—easy starting, silent running, acceleration, and speed, being but a few of its good points.

You may use this testimonial as you please. I am in no way connected with the firm.

Constad, H.

Rear Springing.—

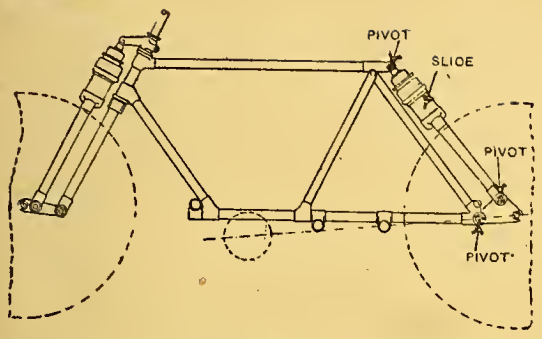

Fig. 5.

rear wheel spindle, engine centre, and the pivot of the arms are shown in line, but directly the springs yield they come out of line and the consequent objections previously referred to arise.

By duplicating the rear frame, a substantial support can be obtained, as will be clear from fig. 6. The wheel is carried by special compression and chain

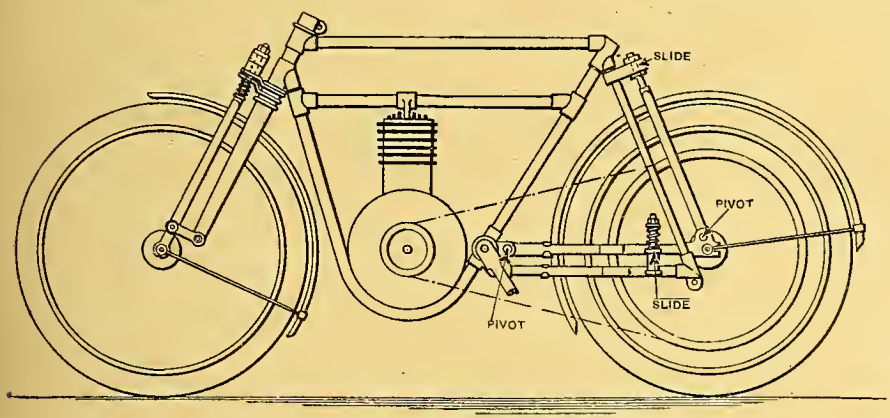

Fig. 6.

stays, which are pivoted at the front to the bottom bracket. This rear frame works in a slide at the top and slides at the bottom, at which point the springs are arranged. There are, therefore, two pivots and two slides at each side, and the increase in weight is considerable. In some respects the design is good.

A construction which has been in use for some years is shown in fig. 7. The wheel spindle is carried

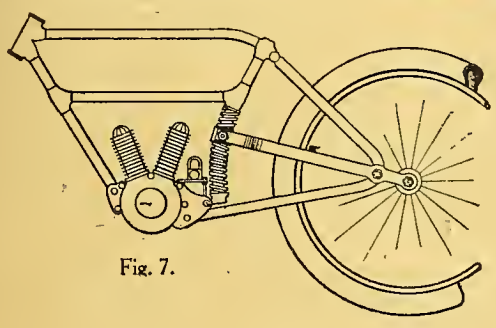

Fig. 7.

at the rear end of a fork pivoted to the rear of the frame and acted upon at its forward end by springs. In this arrangement the engine and wheel centres and the pivot do not always remain in the same straight line. There is only one pivot at each side, and in many other respects this arrangement would appear to have good points.

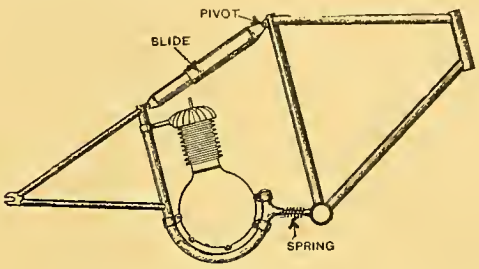

Fig. 8.

In fig. 8 the engine is carried on the rear wheel frame, and is therefore unsprung. Inside the telescopic slide above the engine is arranged a spring, and connecting the engine bracket with the bottom bracket of the frame is a flat steel spring which is worthy of some attention, as it enables a pivot and bearing surfaces to be dispensed with at this point. In this arrangement the belt line remains undisturbed, but it is very unlikely that the necessary engine position would be acceptable nowadays.

In the construction shown in fig. 9, which will be recognised by many, the rear wheel is carried in bearings in a casing which is connected to the top and bottom of

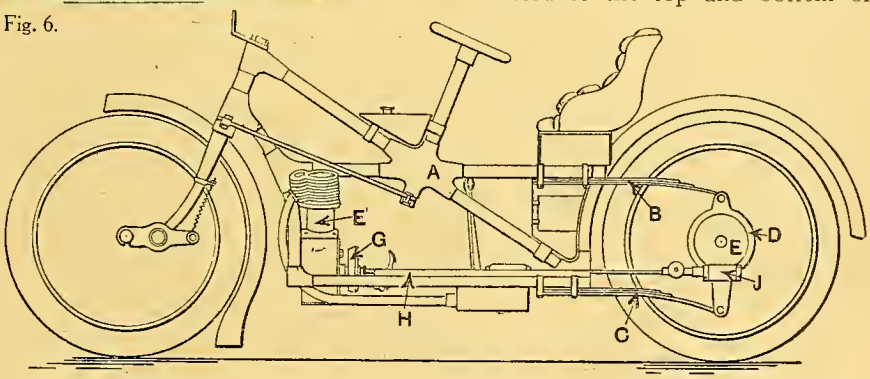

Fig. 9.

the frame by means of two leaf springs at each side, and these springs take the braking and driving torque. The arrangement necessitates the use of a band brake, or its equivalent. As shown, the wheel moves in relation to the mudguard, but this would not appear to be essential. It is possible that this system could be well applied to a frame of the conventional type and to a belt-driven machine.

Half-elliptic springs have been suggested more than once, and the next illustration (fig. 10) shows one scheme. The wheel moves in relation to the mud-

Rear Springing.—

guard, and a frame of very special design is required. A rim brake could not be used, but, of course, this itself is not objectionable. In fact, it is doubtful if the rim brake will survive much longer. The wheel spindle is guided in horn plates, which, being in the nature of slides, are objectionable, as previously mentioned. The wheel would not appear to be well supported laterally, and one would expect the machine to roll a great deal.

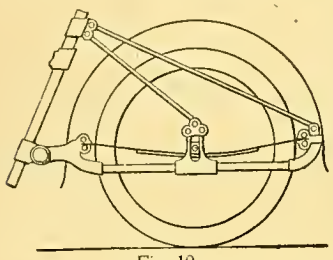

Fig. 10.

In fig. 11 is shown a substantial and simple construction; the rear frame, consisting of the chain stays and compression stays, is pivoted to the bottom bracket and works against springs at the top. At this point a very substantial guide is provided, consisting of curved guide plates carried by the rear frame and bearing against the sides of a guide block on the main

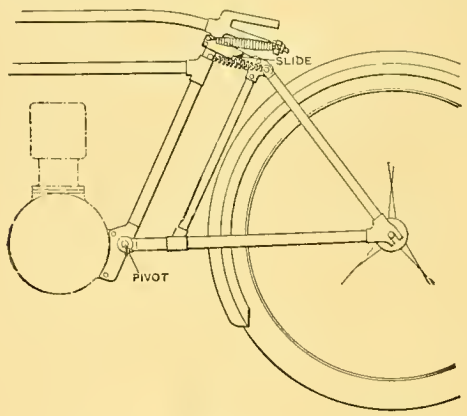

Fig. 11.

frame. Various and ingenious arrangements of springs are suggested, but unfortunately I am not able to go into details of these in the present article. There is only one pivot and one slide. The slide and the springs are practically out of sight, and the frame conforms, to a great extent, to conventional ideas. The pivot is close up to the engine or countershaft, and there is no difficulty about fitting brakes and proper mudguards.

The Bat type of spring frame is shown in fig. 12. Correctly speaking, it is not a spring frame, as the frame is rigidly carried from the rear wheel, and only the rider's seat and the footrests are on springs.

This arrangement overcomes most of the difficulties in the way of the designer, and I think it will be accepted that the frame, which has been in use in varying forms since about 1904, is very practical.

The unsprung weight, however, is large, but it is doubtful whether this is very objectionable in the case of such a light vehicle as the motor bicycle. The objections to "unsprung weight" may not be understood, and it may not be out of place to explain that the weight of the parts not supported on springs should be as low as possible, in order to reduce tyre wear, due to the wheel spinning, and vibration.

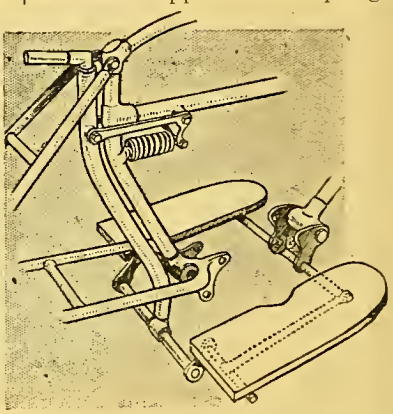

Fig. 12.

Let us consider the case of two wheels, one heavy and the other light, travelling over rough ground. When the heavy wheel strikes a bump it will not rise quickly, but when it does respond it will jump above the top of the bump, and the wheel will leave the ground. The light wheel will lift immediately, and will follow the bump without leaving the ground, so there will be less vibration and less wear on the tyre. Consequently the ideal in this respect is to arrange a spring between the wheel spindle and the frame, so that the wheel alone is unsprung, and is free to follow the contour of bumps and pot-holes without any exaggerated motion.

In the Bat type of frame it will be understood that the saddle moves in relation to the handle-bar. On a very rough road this might be slightly objectionable, but I should doubt it, and it is surprising that this system is not more general, particularly as I believe that with some systems of rear springing engine vibration is very noticeable.

HENRY FORD ON LIGHTWEIGHTS.

I SEE that Mr. Henry Ford has told the American traders that they will never really tap the potential motor cycle market till they perfect lightweight machines, and that they are artificially constricting their output by concentrating so exclusively on the high-powered heavyweight twin. If this is true of America, with its frightful town-to-town tracks and indifferent city roads, how much more is it true of England, with her highly developed roadways! For many a long year I contentedly tooled about on machines scaling between two and three hundredweight. Last winter I hardly ever mounted anything over 150 lb.; and I find that I have almost lost my zest for the heavyweight. I admit that it runs far more smoothly than the best lightweight and that the absence of fuss which characterises its 35 m.p.h. gaits and the greed with which it eats up hills are strong points in its favour. But, nevertheless, my lightweight experiences have inspired me with a marked distaste for hauling a 3 cwt. machine out of its shed, or hoisting it up on to its stand, and, whenever a run is in prospect, I have to fight down an inclination to select the baby two-stroke, and to leave the monsters rusting in their garage. If this applies to a veteran speed merchant like myself, how much stronger must similar inclinations be in the breast of a rider who has but few sporting instincts and few speed memories? IXION.

HUTCHINSON TYRES, 70, Basinghall Street, London, E.C., will send you illustrated lists. Suppliers to British and French Governments. Hutchinson Solid Rubber Tyres for Commercial Vehicles.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Once Used

Always Used

PUNCTURES HAVE NO TERROR
when you use

THE RICH Detachable AIR-TUBES and COVERS.

ADVANTAGES. By carrying a spare tube you can—

Replace tube in five minutes without unscrewing a nut on the machine. Repair at your convenience. Put a patch on the inside with ordinary rubber and solution which never shifts or leaks; no expensive prepared patches required, thereby saving time, trouble, and expense, also prolonging the life of tube and cover. No friction of patch on canvas of cover. Take the valve out and replace from the inside without interfering with valve seating. (All tubes are valve seated on the inside). Turn tube inside out like a stocking by taking the valve out. Take tube to the water for testing without taking machine.

WHY they are the BEST and CHEAPEST

BECAUSE—They are made of the **best** rubber and of substantial thickness. Have free passages of air, and **no** butt-ends to burst. Save you hotel and train expenses. Enable you to keep an appointment. No need to repair by the roadside and keep your friends waiting. Last longer than any other tube. Save your tyre bill.

Don't spoil your Tour by delay with punctures. Carry a Spare.

If you cannot obtain them from the Trade, write direct. Sent per return post.

FIRST IN 1904, FIRST ever since. GUARANTEED AIR-TIGHT.

A User writes:

Bognor.

I have been a motor cyclist for some years, and have owned and ridden six different machines. I had all the usual troubles, tyres, endless and butt-ended, and in course of time got one of your specially jointed tubes. The result was so satisfactory that I never use any other sort, and if I had a puncture I did not mind much, as by carrying a spare tube it was only a matter of a few minutes to change it. When once your system is known, no other sort will ever be used.

Further particulars, write for booklet.

The Thames Rubber & Leather Co., 199, Upper Thames St., London, E.C.

When YOU buy a New Machine invest in the JAMES — The ORIGINAL All-enclosed Chain Driven Type with Countershaft 3-speed Gear.

The JAMES has been styled "The PERFECT Motor Cycle" because of the efficient "No-trouble" service it always yields even under the most adverse conditions, and to-day is offered you in three models as under:—

No. 6. 4¼ h.p. "Big Single" 3-sp. For Sidecar use 60 Gns.
or complete with JAMES Canoelet Sidecar, 13 Gns. extra.

No. 7. 3½ h.p. Twin, 3-sp. with Hand-controlled Clutch, Solo .. .. 60 Gns.

No. 8. 2¼ h.p. 2-stroke, 2-speed, Lightweight .. 35 Gns.

Its recent selection for War purposes by the Allied **English, Belgian, French, and Russian Governments** is conclusive proof of its recognised Strength, Power and general Serviceability, and we ask prospective buyers to note that the JAMES Models may be fully inspected at our Sole Agents in all principal Towns.

Call to-day, or write us for copy of Art Catalogue fully describing all our models.

The JAMES CYCLE Co. Ld.

Greet, BIRMINGHAM.

London Depot: 12, Holborn Via., E.C.
B'ham Depot: 9, Broad Street Corner.

The model here illustrated is the

"JAMES"

No. 8. 2¼ h.p. 2-Stroke, 2-SPEED LIGHTWEIGHT

—an exceedingly attractive machine, easily manipulated and controlled, and allowing of a low riding position which always ensures that feeling of perfect safety. Power unit is wonderfully efficient, enabling all reasonable hills to be climbed on top gear; speed from 4 to 40 m.p.h.

Price: 35 GNS.

"THE MOTOR CYCLE" RECRUITING SECTION.

Good Response to Motor Machine Gun Service. Patriotic Offer to Cyclists by a Motor Cycle Works Manager.

A SPLENDID batch of sixty-five to seventy men attended the inspection of recruits for the Motor Machine Gun Service last week, and the majority were accepted and attested forthwith. The men had come from all over England as the list published below of accepted recruits shows. The recruiting list cannot remain open very much longer, that is, if men continue to come forward as readily as they have done of late. Last week's new recruits were:

Alcock, C. A., Bootle.
Atkinson, R. H., Scarborough.
Bainbridge, W., Blackhill, Co. Durham.
Barkus, H., Loughborough.
Bauerstock, W. H., Tenbury.
Binks, S., Leeds.
Bird, C. J., Newark.
Blay, G. H.
Burgum, J., Moses Gate, near Bolton.
Crole, H. I. N., Ramsgate.
Crowther, H., Dewsbury.
Cunliffe, B., Rochdale.
Davenport, H. A., New Southgate, N.
Douglas, T.
Fowler, S.
Green, R. C. C., Leamington.
Gunn, W.
Hart, F., Bolton.
Hearn, G. S., Camberwell, S.E.
Hill, A., Liverpool.
Hudson, C., Leeds.
Hunter, W.
Jones, T. H., Cannock.
Keating, V. L., Aintree.
Lane, W. H., Manchester.
Lowe, C. F.
Lyle, Victor.
Macdonald, W. L., Manchester.
Massey, W., Leicester.
Melines, G. W.
Molle, G. W.
Moseley, K. M., Walthamstow.
Owen, A., Liverpool.
Penny, C. G., Ulverston.
Philipson, A. M., Retford.
Roberts, F. S., Sydney, N.S.W.
Russell, W. H., Higham.
Saunders, A., Taunton.
Shaw, A. J., Sheffield.
Shone, W., Chester.
Short, Wm., Coventry.
Smith, J. A., London.
Stevens, H., Gainsborough.
Stevenson, L. E., Newport Pagnell.
Stubbs, W. G., Ipswich.
Sykes, G. M., Bradford.
Thornett, C. A.
Tippett, F. H., Blackheath.
Tyldesley, E. C., Bolton.
Tyler, J. G. W., London, E.
Unthank, G. D., Yatton.
Walther, K. A., Newcastle-on-Tyne.
Walton, Frederick, Manchester.
Windridge, C. H.
Wolstenholme, John, Manchester.
Young, H., Hyde.

Of the above a number had had previous military training—a real advantage. A few pedal cyclists were included in the batch, but only men of good physique with some engineering knowledge were accepted. Any good cyclists with a knowledge of machine guns should mention the fact when applying.

The case of F. S. Roberts is worthy of special mention. This patriotic motor cyclist left a successful business in Sydney, N.S.W., to his partner and paid his own expenses to England to enlist. Though qualified for an artificer's position at 6s. per day, he preferred the ranks at 1s. 2½d. Having done eighteen months military training and been in the motor cycle trade since 1901, Roberts should be useful to the M.M.G.S., which section now boasts a large number of men of exceptional skill.

Another recruit just home from Sydney and accepted last week as a car driver is Wm. Short. Others came from Siam and Canada.

It shows the spirit with which some men enlist when we state that one man who was rejected by the doctor sobbed on being told of the fact.

A copy of a special poster giving terms of service in the M.M.G.S. will be gladly sent to any applicant who can exhibit it prominently.

A number of readers have applied stating that they will be free in three or four weeks' time. As it is not known how soon the requisite number of men may be obtained, motor cyclists should not apply until they are free to enlist.

THE DESPATCH RIDER IN TRAINING. He gets there and back with his message before the telephone wire is laid.

"The Motor Cycle" Recruiting Section.—

Friday morning's post brought eighty-two letters of application.

It is likely that there will be a call for despatch riders in the Royal Engineers ere long, as a large batch left for the Front last week. Only experienced motor cyclists able to perform all ordinary running repairs are accepted for the R.E.

A patriotic offer has been made by Mr. W. H. Carson, of Messrs. Fayliss, Thomas and Co., makers of Excelsior machines. Noticing that a limited number of well-developed cyclists will be accepted and taught to handle the sidecars used by the M.M.G.S., Mr. Carson has written to Mr. G. Smith offering to place his services at the Government's disposal in training possible recruits either mechanically in the Excelsior works or in driving motor cycles and sidecars. Mr. Carson is to be heartily thanked for his patriotic offer.

We repeat below the chief terms of service, and recommend those ready to enlist to fill in the form on this page and post it to Mr. Geoffrey Smith, Editor of *The Motor Cycle*.

The next inspection is on Wednesday, August 4th, 2.30 to 4 p.m., at the Recruiting Office, Masonic Hall, Coventry. Candidates may attend without necessarily writing beforehand.

General Particulars.

AGE.—19 to 38.

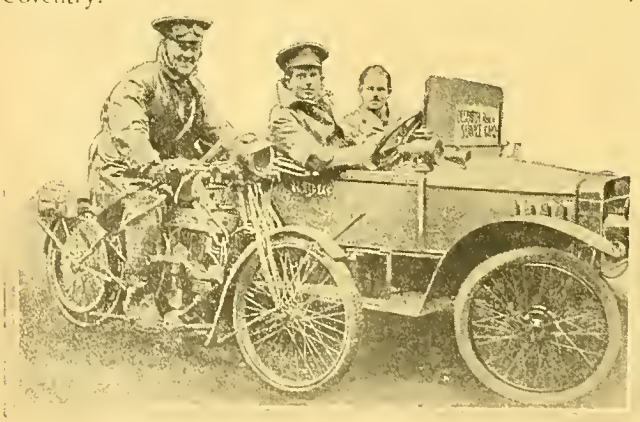
HEIGHT.—Not important so long as applicant is physically sound and well developed.

ENLISTMENT.—For duration of war.

EYESIGHT.—Glasses do not necessarily debar men from service, provided they can see quite well with them.

PAY.—1s. 2½d. per day; all found; usual separation allowance.

Readers who cut out and fill in the form referred to will, provided that the particulars are in order, receive a free railway warrant to attend the next inspection in Coventry.



A Douglas and a G.W.K. in France. At the wheel of the latter is Sergt. R. Gore, who gained a D.C.M. when riding a Douglas. The despatch rider on the Douglas in the picture is Corpl. E. Hooper.

After filling in the above particulars return to:

MR. GEOFFREY SMITH,
Inspecting Officer, R.E.,
South Midland Divisional Area,
19, Hertford Street,
COVENTRY.

The Editor has received a number of letters from men comfortably settled in the service, and others from men who found sleeping on the floor rather rough, but who took to the change good-naturedly!

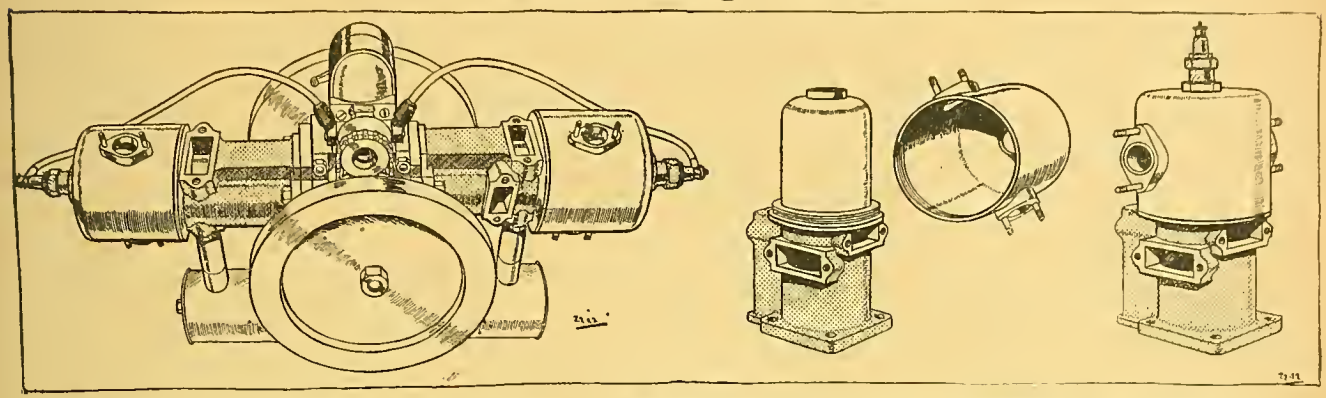
One of our contributors, Mr. H. W. Fortune, of Harrogate, offered himself for enlistment a few weeks ago, but was rejected on medical grounds and recommended to undergo an operation. This Mr. Fortune has done, and he is now well on the way to recovery, and hopes soon to be well enough to be passed by the doctor.

R. C. C. Green, before enlisting in the M.M.G.S., was works manager of the Coventry works of Waygood-Otis, Ltd., the big lift people, who have 400 employees serving with the Colours. Although engaged on important Government work, Green was anxious to serve in a more combatant way, and he obtained a man above the military age to take over his duties. He was the owner of a luxuriously equipped 1915 6 h.p. A.J.S. sidecar outfit.

Since we were authorised to recruit motor cyclists we have had many requests for transfers from various regiments to the M.M.G.S. and R.E. It has always been a difficult matter, and the difficulty has increased instead of decreasing. A few months ago transfers from the New Armies were forbidden, and now an Army Order, issued a few days ago, notifies that no enlistments from the Territorial Force into the Navy, Regular Army, Special Reserve, or Royal Marines will be considered unless on urgent public grounds

A Water-cooled Levis Horizontally-opposed Engine.

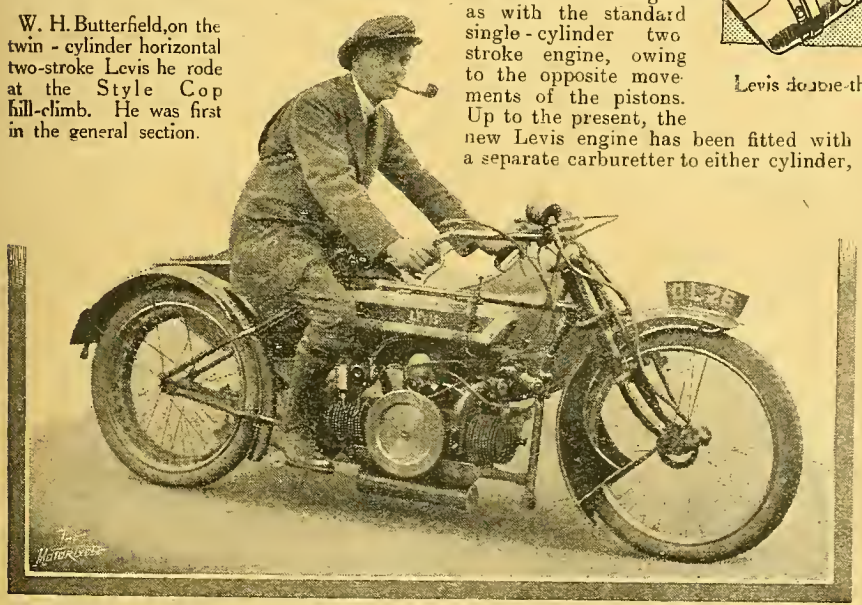
Novel Method of Making Water Jackets.



The Levis two-stroke two-cylinder water-cooled engine. The left-hand sketch shows the general arrangement of the engine, and in particular the two outside flywheels. On the right will be observed a cylinder with and without the novel aluminium water-jacket shell.

SINCE the short description of the Levis horizontally-opposed twin-cylinder two-stroke engine appeared in our issue of May 6th, some further improvements have been made in its design, more particularly in fitting water-cooled cylinders, in order to render this power unit thoroughly suitable for sidecar work. The chief features of this engine lie in the arrangement of the crankshaft, cylinders, and the two outside flywheels. Each cylinder is of the three-port type, being identical as regards bore and stroke, with the standard Levis cylinders of 2¾ h.p., but with the difference that the cylinders are fitted with water jackets, the ingenious construction of which is shown in one of the sketches. These cylinders are opposed to each other horizontally, being bolted to a small compact crank case which houses a double throw crank, having crank pins arranged at 180° to each other. The flywheels are arranged one on either side of the crank case, and the magneto is placed in a position directly on top of the crank case and chain driven from the crankshaft.

W. H. Butterfield, on the twin-cylinder horizontal two-stroke Levis he rode at the Style Cop hill-climb. He was first in the general section.

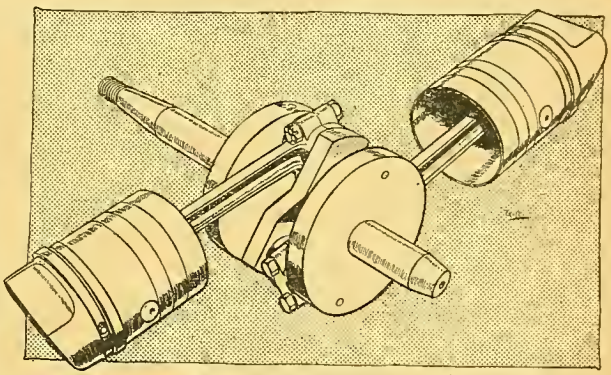


The Principle of Working.

As the engine works on the two-stroke principle, it will be seen that the firing in both cylinders occurs simultaneously at each revolution of the crankshaft, therefore the impulses are no more frequent than in the ordinary two-stroke single-cylinder engine. The great feature, however, of this engine is the practically perfect balance accruing from the arrangement of the crank pins and pistons. The flywheel on either side of the crank case also assists towards smooth running. The compression of petrol vapour in the crank case is also the same in this engine as with the standard single-cylinder two stroke engine, owing to the opposite movements of the pistons. Up to the present, the new Levis engine has been fitted with a separate carburetter to either cylinder, but a single instrument, in conjunction with a special induction pipe, will be fitted in future. It should be noted that the crankshaft is cut from a solid bar of steel, and drilled for lubrication on the Levis system.

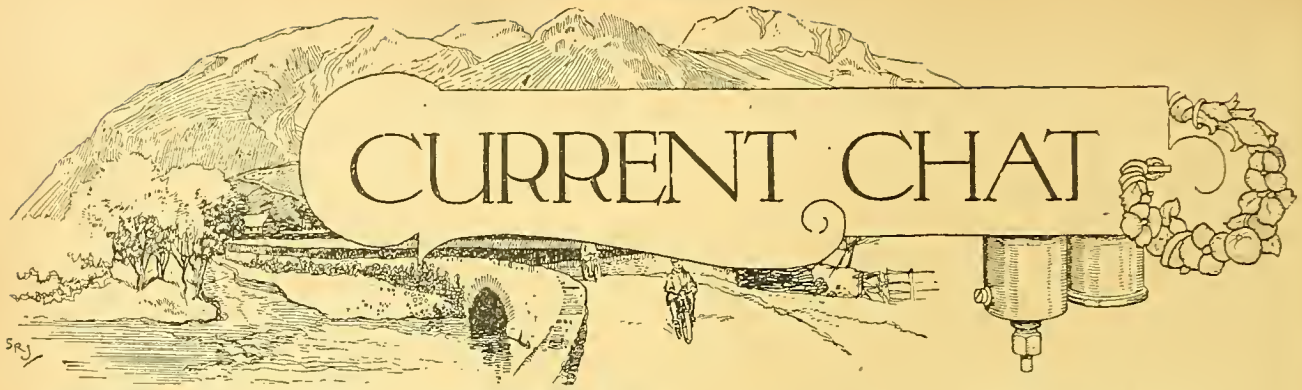
The Water Jacket.

The new Levis water jacket is a very ingenious piece of work. The jacket is cast separately in aluminium and machined all over, and attached by a threaded flange on the cylinder and also by a screw plug in the cylinder head. As the cylinders are also machined outside down to the flange, the weight can obviously be kept very low, whilst the aluminium jackets render the appearance of the engine very neat. The joints of the jacket are made watertight by the introduction of copper-asbestos washers.



Levis double-throw crankshaft with connecting rods and pistons.

It is the intention of Messrs. Butterfields, Ltd., to incorporate this engine in a luxurious sidecar outfit in combination with an Enfield two-speed countershaft gear. Although the engine is rated at 5-6 h.p., and possesses a cubical capacity of only 698 c.c., it develops over 12 h.p. on the brake test, and this constitutes a fine reserve of power. During all its tests on the road it has had a single gear of 5 to 1 in conjunction with chain and belt drive, and hills like Ankerdine it will ascend with the greatest ease.



TIMES TO LIGHT LAMPS.

July 29	...	...	8.53 p.m.
,, 31	...	...	8.50 ,,
Aug. 2	...	...	8.47 ,,
,, 4	...	...	8.43 ,,

Two Carburetters.

It is an interesting fact that W. H. Butterfield's twin horizontal Levis, which performed well in the Style Cop hill-climb, had one carburetter for each cylinder.

The Sale of Petrol.

We are often asked what licences are necessary as regards the sale of petrol. First of all, to store petrol a licence must be obtained from the local inspector under the Petroleums Act, and in order to sell the spirit a further licence is necessary, which costs 5s., and is obtainable from the Excise Authority.

Pillion Riding.

We have repeatedly drawn attention to the danger of pillion riding, and only last week we read of a fatal accident from this cause. There may be but little risk on dry roads with careful driving, so long as nothing unforeseen takes place. But in a sudden emergency, which may occur at any time, the extra weight of a passenger on the carrier may make all the difference between success in getting out of a tight corner and failure to do so. Certain of our readers will, we suppose, continue the practice in spite of all warnings. We only hope that they may not have cause to regret it.

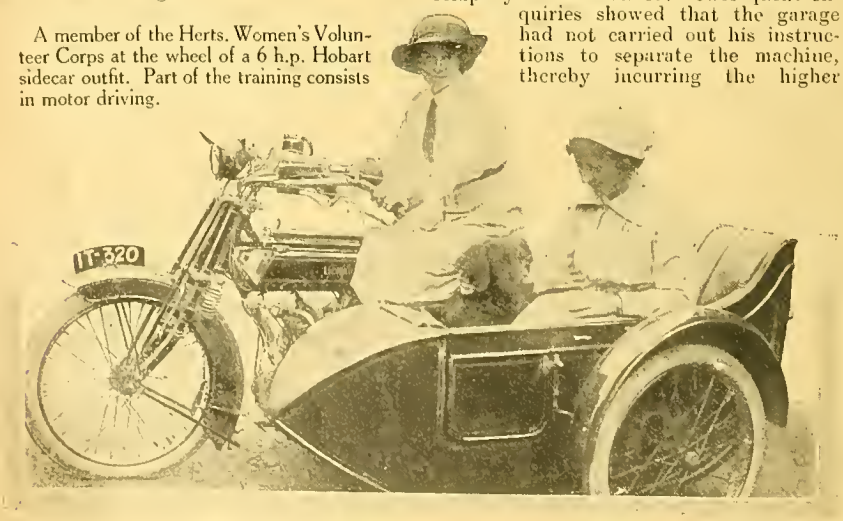
A.A. and M.U. Notes.

High Hedges at Corners.—In making his report concerning an accident which occurred recently on the Worthing Road, an A.A. patrol urged that the danger at the corner which was the scene of the accident would be greatly lessened if a thick hedge could be cut down to a reasonable height. The Association subsequently had the spot inspected and decided to approach the owners of the land. Instructions have since been given for the necessary cutting down to be done.

On the Leatherhead Road a similar danger existed at a bad corner, and the owner, upon receiving a communication from the Automobile Association, has kindly consented to cut the hedge down.

How to Send Motor Cycles with Sidecars by Rail.—Motor cyclists desirous of sending their machines with sidecars by rail should note that, if the sidecar is detached before despatching, a considerably reduced rate is charged by the railway companies. A case recently dealt with by the Automobile Association shows the importance of observing the regulations for the transport of such vehicles. An A.A. member enquired the cost of sending his cycle and sidecar from London to Inverkeithing. He was quoted 30s. if the sidecar were separated from the cycle. He therefore gave the necessary instructions to a garage where the machine was being stored, and subsequently received a bill from the railway company for £13 8s. 6d. Subsequent enquiries showed that the garage had not carried out his instructions to separate the machine, thereby incurring the higher charge. The member was reluctant to hold the garage proprietor financially liable for the larger amount he was asked to pay, and decided to place all the facts before the Automobile Association. The Association communicated with the two railway companies concerned, who generously reduced the charge from £13 8s. 6d. to £3 7s. 3d.

A member of the Herts. Women's Volunteer Corps at the wheel of a 6 h.p. Hobart sidecar outfit. Part of the training consists in motor driving.



SPECIAL FEATURES.

THE REAR SPRINGING QUESTION
Illustrations.
"THE MOTOR CYCLE" RECRUITING SECTION.
THROUGH FEMININE GOGGLES.

Clubs and the War Loan.

We have already mentioned several clubs whose committees have invested money in the War Loan. Mention must also be made of the Bradford M.C.C., which has put £200 in the Loan. The Bradford Club, by the way, has a quarter of its members serving in various capacities in H.M. Forces, and of the remainder a large number have joined the local volunteer corps. Quite a good record!

Spare Parts and the Holiday.

Motor cyclists in want of spare parts would be well advised to apply for them to-day, as a number of manufacturers will, after strenuous efforts in the works, be closing for a day or so for the August Bank Holiday. Strange as it may seem, some owners with machines temporarily held up by repairs make a practice of wiring to the makers of their machines during the holiday period, and expect their request to have prompt attention. A little forethought at this moment may save much inconvenience on the road next week.

The King's Visit to the Midlands.

Among those presented to His Majesty during his flying visit last Thursday to some of the Coventry factories engaged on Government work were Mr. A. H. Niblett (Humber), Mr. C. W. Hathaway (Triumph), and Mr. Alfred Bednell (secretary Motor Cycle Traders' Union), as members of the Armaments Output Committee. In the course of his rapid tour through the Rover works His Majesty the King saw motor cycles in course of construction, though at the present moment the greater part of the Rover Co.'s energies are concentrated upon work of a more important and pressing nature.

During his tour of the Birmingham factories His Majesty visited the B.S.A. works, and among those presented to him was Mr. C. A. Hyde, general manager of the cycle and motor cycle departments.

The "Khaki" Meeting.

The Motor Cycle's efforts to arrange an all-khaki meeting at Brooklands, as suggested to the Editor by a motor cyclist officer, have proved successful. The event will take place on August 7th.

Second-hand Prices.

We give below the average prices of the various second-hand models offered for sale in the last issue of *The Motor Cycle*, and also the average prices for the last eight weeks :

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.
A.J.S.	1914	6 3-sp. sidecar	£70	£72
Bat	1913	6 3-sp. sidecar	£51	£51
Bradbury	1913	4 2-sp. sidecar	£29	—

IRISH "END-TO-END" WINNER.

R. Jones (B.S.A.), winner of the principal award, the Palmer trophy, in the Irish End-to-end trial. The full results will be found on page 116 of this issue.

The A.C.U. Official Touring Guide.

THE OFFICIAL TOURING GUIDE OF THE AUTO CYCLE UNION, 1915-16; 3s. 6d. post free from the Auto Cycle Union, 83, Pall Mall, S.W. This year's edition of the A.C.U. handbook, while remaining of a size suitable for the pocket, has been revised and much new matter added. The annual report gives some particulars as to how the Union has been of international service up to March last, and since that date the work in connection with recruiting, supplies, and assistance to the various Government departments has continued. The most valuable information of all is contained in that section devoted to touring. A number of favourite tours have been drawn up, and particulars can be instantly sent to members on application. A circular and comprehensive tour in England, Wales, and Scotland has been compiled, covering a total distance of 3,212 miles. Quite a novel feature is a distance table, giving the approximate number of miles between the important towns in England and Wales. Further useful information is a list of notable test hills, giving their approximate gradient and length. The list of ferries has been revised and brought up to date, and is of great use to the tourist, including, as it does, not only those in England and Wales, but in Scotland also. The list of officially appointed hotels and repairers has been completely modernised and rearranged in a clear and lucid manner. The legal section has also been revised, and the principal headings have been placed alphabetically. The Touring Guide, although sold to the general public at 3s. 6d., is free to members.

Swivelling Lamps.

There has been a lot of unnecessary fuss made concerning swivelling lamps on motor cycles. As we recorded last week, one magistrate advised the police to withdraw a summons. In any case, all that is needed is simply to solder the swivelling device, or to fit a pin right through, as described by a reader in our Letters page this week.

Racing in the Argentine.

A race meeting, in which British-built machines won the principal awards, was held at Buenos Ayres on May 23rd. The timing was over a kilometre of a straight road of good surface. Results :

LIGHTWEIGHTS :	1. N.U.T.	...	50 m.p.h.
	2. Singer	...	48 „
3½ H.P. CLASS :	1. Matchless	...	62 „
	2. Bat	...	55½ „
UNLIMITED :	1. Indian	...	75½ „
	2. Matchless	...	73½ „
SIDECARS :	1. Matchless	...	60 „
	2. Pope	...	53 „

These are high speeds, and our correspondent tells us that the timing was electrically controlled. The Indian lowered the previous record of 70 m.p.h. made on a machine of the same make.

A meet of the Burnley Motor Gipsy Club. The membership totals about seventy, the great majority of the members being possessors of sidecar outfits.

Where Spring Fr

AMES are NEEDED.

WHEREAS the state of British roads has in the past been the pride of motor cyclists, the deterioration of road surfaces, due collectively to the exceptional military traffic, the extension of motor 'bus routes, and the growing use of petrol and steam tractors, is very noticeable. Undoubtedly there is more pressing need for spring frames on motor cycles at the present time than ever before in their history, and "The Motor Cycle" this week devotes special attention to a study of the problem. The upper pictures show typical trials routes, the lower views depicting main roads cut up by heavy traffic.

THE ALL-KHAKI RACE MEETING.

Brooklands, Saturday, August 7th, at 2 p.m.

ENTRIES for this event are coming in quite well, and there is every prospect of its being an unqualified success. The original idea was that of Lieut. F. M. C. Houghton, 25th Divisional Cyclist Company, Aldershot, who suggested it in a letter to the Editor of *The Motor Cycle*, who immediately took steps to see how much of the track was available, and found, on investigation, that quite a sporting afternoon's racing might quite easily be arranged. The B.M.C.R.C. was approached, and this body, which has done more than any other to encourage motor cycle racing in the United Kingdom, has undertaken the organisation.

There are no fewer than eleven events on the programme, the first beginning at 2 p.m. At present the most popular events are Nos. 3, 4, 9, and 10, being respectively the medium-weight half-mile sprint race for touring machines not exceeding 500 c.c., the medium-weight half-mile sprint for racing motor cycles not exceeding 550 c.c., the serpentine slow race for machines of any description (in which competitors will ride about five hundred yards between posts without putting their feet down), and the medium-weight hill-climb for machines not exceeding 500 c.c. Another interesting item in the programme will be the quick change plug race for solo machines of any description. Competitors are to ride a quarter of a mile, change the sparking plug, ride a further quarter of a mile, dismount, turn round, return a quarter of a mile, again change the plug, and ride a quarter of a mile to the finish. Entrants should arrive provided with a spare plug.

Events are provided for all types of machines, and the meeting is one which will especially appeal to a competitor who has never entered a race meeting before. Any officer or man in the British Navy or Army, and the Allied Forces, wearing uniform, may compete.

Actual entries have been received fr

Captain G. L. Andrew	Lieut G. H. Walker
Lieut. J. H. C. Lindsay	Lieut F. M. C. Hough
Captain J. H. Storey	Pte. A. C. S. Irwin
Lt. V. Spencer Daniell	Pte. R. A. Waddy
Lance-Cpl. Collard	Lieut W. E. Collins
Lieut. H. W Tait	

Entries are also expected from following :

Asst. Paymaster Marcel, R.N.R.	Cpl. H. R. Whitmore
Lieut. J. Healy	Capt. A. H. Mawer
Br. C. C. Dixon	Lieut. R. G. Collingw
Lieut. F. Sowrey	Lieut. C. D. Siddeley

ROADS TO AVOID.

Bad Stretches Notified by Readers.

OUR appeal to readers to send us accounts of roads which have suffered unduly from the passage of heavy motor vehicles since the outbreak of war has brought some useful information for which we are indeed grateful. The roads in the south and south-west seem to have suffered to the greatest extent. Round Oxford we learn that there are some exceedingly bad stretches, while in the north also certain roads have been severely cut up. Information is very hard to obtain, and it is quite possible that some of the roads which we are reporting as in bad condition have now been repaired. It is impossible to prevent such a contingency, as some of the county councils are doing their utmost to remedy the damage the roads in their districts have undergone.

The Winchester District.

We will begin at Winchester, which is an important centre where an exceedingly bad state of affairs exists. The fine old Roman road from Alresford has now ceased to be. It is a road no longer, being inches, if not feet, deep in dust in dry weather, and the same in mud in wet. The avoiding route is by Itchen Abbas and Kingsworthy, which is fairly good. It is perhaps better to go to Winchester from London through Basingstoke, but there is a very pot-holey stretch of about two miles east of Basingstoke. From Winchester, in the direction of Bishop's Waltham, there is a bad stretch of road in the direction of Twyford, while the road from Winchester to Romsey is in an appalling state, and travellers journeying west should proceed as far as Bassett, near Southampton, and then turn off and go through Shirley and Totton. The road from Totton to Lyndhurst is now in first-class condition.

As regards Salisbury, the road from Upavon through Amesbury to Salisbury was marked on the A.A. map as being bad. The road from Salisbury to Devizes *viâ* Shrewton and Lavington is bad between the two last-named places. Ludgershall should be avoided, as the roads are not only in very poor condition, but there has been lately a good deal of loose metal lying about. The road between Wilton and Shaftesbury is marked as being in bad condition, also a stretch between Warminster and Wylie.

Bristol and the West.

Farther west, between Chippenham and Bristol, the road is very bad by Warmley and Wick, while Pewsey to Devizes is rough going at the present time. The road from Bristol to Gloucester is very bad as far as Berkeley Road. All exits from Bristol are in poor condition. The road from Exeter to Bodmin *viâ* Okehampton is bad.

From Guildford to the foot of Hindhead is in bad condition (but this can be avoided by going through Farnham, Alton, and Petersfield), and so is the road between Merton and Sutton. In Kent the road between Farningham and Wrotham is in a shocking state, also between Farningham and Sevenoaks, while we have reports of a bad stretch between Ashford and Folkestone.

Sundry parts of Sussex have also suffered; for instance, between Lewes and Pevensey and each side of the coast road with Newhaven as a centre. There are also bad stretches in the neighbourhood of Shoreham.

The Midlands.

Approaching the Midlands, the Oxford-Woodstock road is in poor condition as far as Wolverton, and the Oxford-Banbury road is also in poor condition. All roads and streets in Oxford are in very bad order. The Coventry-Birmingham road is in a shocking condition at Meriden, near Coventry, and nearly by-roads should be avoided in the B mingham district. There are numer pot-holes on the Holyhead road betw Daventry and Fenny Stratford.

The worst road in the Nor apparently, is from Newcastle, *via* Ott burn and Carterbar, to Edinburgh, shortest route between Newcastle and Scottish capital. One of our reade reports says that the summit "is a loose, but not very rough, an irregu roughness which is much more comfo able than waves at high speeds. It quite good enough at fifty miles an h except on the bends." Another of our formants, however, gives a rather wo account than this.

In Wales, certainly the worst road which we have heard is between Corw and Cerrig-y-Druidion on the Holyh road. This is in very bad order, ow partly to a motor omnibus service a partly to traction engine traffic.

Eastern Counties.

The east coast main roads are, on whole, in very good condition. Howev an enthusiastic reader has sent us following reports: The road from Ca bridge to Bedford has a tarred surf to Eltisley, broken or loose at interv with good stretches, part of this r is being retarred, and is bad through town of St. Neots. Cambridge to E the first quarter of a mile is bad, t good to Milton village. There is a lo portion between the seventh milest and the bridge over the river Ely. road from Cambridge to Norwich very good on the whole, but rather lo in places. From Barton Mills, howev this is being repaired.

We would heartily welcome any s gestions, additions, or corrections to above, as well as further news conce ing bad roads not mentioned here.

Midland Motor Cyclists' Volunteer Corps.

HOW AN INGENIOUS SCHEME WENT WRONG.

ON the 25th inst. the corps paraded at Hodge Hill Common for a route march and manœuvres at Great Alne and Aston Cantlow. *En route* the men encountered floods owing to the recent rain. They were sent intentionally by this route to exercise the men in crossing country covered with water.

On reaching Henley, the boundary, the troop commanders took over their troops, Blues proceeding to their headquarters at Aston Cantlow Reds to their headquarters at Great Alne. Unfortunately rain commenced and continued through the whole of the operations, but the troops, although drenched, finished the day's work.

Members of the Midland Motor Cyclists' Volunteer Corps at a ford.

Troop Commander Butterfield commenced operations by sending out flanking patrols, who quickly returned, reporting a clear road. Leaving a portion of his troop to guard his headquarters, he made an advance on to the River Alne. This had to be crossed before an attack could be made on Blues.

The River Alne just now is in a state of flood. The bridges being out of bounds at Henley and Alcester, there were left only the fords and the bridge at Great Alne. The Reds got over by planks, and crossing the railway line got into Blues' territory.

Blues' Troop Officer Randolph put out his scouts, and these returned with the information that the fords were impassable and that Reds were in force at the bridge; therefore he decided to entrench and act on the defensive.

The section of Reds, after considerable difficulties, had advanced over the country and approached Blues' headquarters. Not suspecting an ambush, they went on and were captured.

At this period an interesting incident occurred. Trooper Richards, unseen by the Blues, slipped a note in the hand of a country lad with instructions to take it over the river and give it to the Reds. The country lad took the note, got to the river, saw some other inhabitants, and asked them if they had seen any volunteers about. No sooner had he asked the question than a head appeared out of a ditch, exclaiming "Yes, I am one." The lad gave him the note. Unfortunately for Reds, the owner of the head was a Blue scout.

Blues' officer now decided to rush the bridge and make an attack in force on Great Alne. This, after overcoming obstacles, he succeeded in doing, capturing the remainder of Reds.

ACETYLENE LAMP TUBING.

THE Leicester Rubber Co. have a good article in their acetylene lamp tubing, having devoted considerable thought and time to the evolution of satisfactory rubber tubing.

Two troubles to be avoided in acetylene lamp tubing are splitting at the end and kinking in some part (so causing the lamp to go out), and the Leicester Rubber Co. claim to have overcome them. It is common practice nowadays for front and rear lights to be fed by the same generator, and this necessitates a long length of tubing. This calls for all the more care in the making of the tubing and quality of rubber used.

The sample we have received is undoubtedly of fine quality, and should give excellent service.

NEW RACING TRACK FOR SYDNEY.

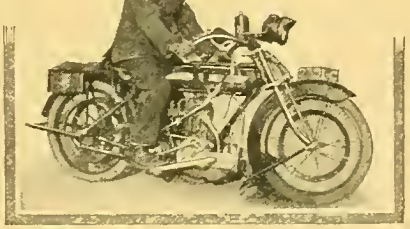
A QUARTER-MILE motordrome, built at an angle of 50°, the track proper being 30ft. wide, independent of an 8ft. runway, is in course of construction at Sydney, New South Wales. Previously several unsuccessful attempts have been made to erect a motordrome in or near Sydney, but a competent authority states that they have failed in every respect due to lack of experience in such matters. It is thought that the new motordrome will soon gain a big name, as motor cycling is at present in its infancy, though very popular in New South Wales, but it is generally recognised that there are tremendous possibilities for the motor cycle. As soon as the track is finished and available for racing it is proposed to match one or two of the leading British riders against the local cracks, and the promoter of the track is now endeavouring to fix up contracts with leading home riders. In this respect he may have some difficulty, as the best men, if not in the firing line, are engaged at home on Government work.

LIVERPOOL MECHANICAL TRANSPORT CORPS.

THIS corps continues to make progress in its training, and it has been very busy during the past few weeks. Drills are held every Tuesday and Thursday evenings at the North Haymarket, St. Anne Street. The heavy car and light car sections have operations every Saturday and Sunday, and the motor cycle and signal sections have been equally active.

A week-end camp has been arranged for the August Bank Holiday, and it will be held at Helsby, Cheshire.

Those wishing to join the corps (motor cyclists especially are wanted) should apply to the O.C. at the North Haymarket any Tuesday or Wednesday evening. Needless to say, they must have a good reason for not enlisting.



Sergt. T. Hubbard, whose name will be familiar to many of our readers as a competition rider in the days before the war. His mount is a B.S.A., and he is now at one of the R.E. despatch riders' training centres

Irish End-to-end Trial Results.

The Palmer Trophy Awarded to R. Jones (4¼ h.p. B.S.A.)

THE committee of the Ulster centre of the Motor Cycle Union of Ireland did not meet to consider the awards in the end-to-end of Ireland reliability trial until Wednesday of last week, and, after lengthy consideration of a number of points that were raised, they issued the following list of awards:

PALMER TROPHY FOR BEST PERFORMANCE.—1, R. Jones (4¼ h.p. B.S.A.); 2, W. H. Freeman (7-9 h.p. Indian); 3, J. Doleman (3½ h.p. Rover); 4, R. S. Russell (2¾ h.p. Douglas).

TEAM PRIZE. — Douglas riders: J. Stewart, R. S. Russell, and "Sou-wester."

SIDECAR PRIZE.—C. B. Franklin (7-9 h.p. Indian sc.).

GOLD MEDALS.—J. Stewart (2¾ h.p. Douglas), "Sou-wester" (2¾ h.p. Douglas), J. Browne (3½ h.p. Rover), T. Toole (4¼ h.p. B.S.A.), C. B. Franklin (7-9 h.p. Indian sc.), J. Dwyer (4 h.p. Triumph), A. W. Mooney (6 h.p. Bradbury sc.), and F. L. Dooly (4¼ h.p. B.S.A.).

SILVER MEDALS.—J. Farren (5 h.p. Indian), W. J. Henderson (7-9 h.p. Harley-Davidson sc.), J. Chambers (4¼ h.p. B.S.A. sc.), T. W. Ladd (6 h.p. Bradbury sc.), J. T. Woods (4¼ h.p. B.S.A.), and E. G. Jack (3½ h.p. Rover).

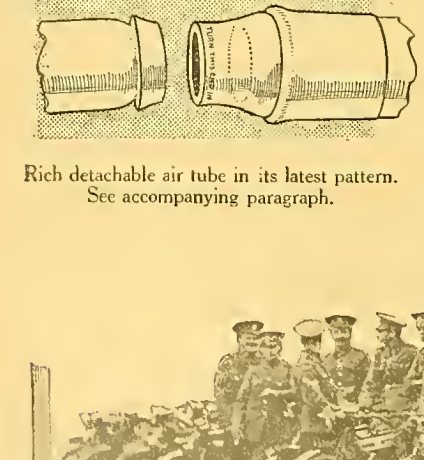
It was understood that the awards published prior to the meeting of the committee merely awaited the arrival of some of the checking sheets from the South to see that no marks were lost at the open and secret controls. These awards gave the first prize and the Palmer trophy to W. H. Freeman, on the assumption that Jones would be penalised for repairing his tyre while officially stopped at the foot of Iscar Hill while in a non-stop section. The committee decided that the repair was permissible, and as Jones's performance in the flexibility test was adjudged to have been the best of the twelve riders who secured full marks at the open and secret controls, he was awarded the first prize. As this put Franklin into fifth place, he was awarded the sidecar prize for the best unplaced sidecar performance, which would otherwise have gone to Mooney, who was the only other sidecar rider to qualify for a gold medal. As Browne's stop on the last series of hills was not officially reported although admitted by the rider, he was given his gold medal. Doleman was incorrectly reported as having failed on these hills. He was apparently mistaken for Browne, who was mounted on a similar machine.

THE LATEST PATTERN RICH DETACHABLE AIR TUBE.

THE accompanying sketch shows the latest pattern Rich detachable inner tube, the handling of which has been recently taken over by the Thames Rubber Co., 199, Upper Thames Street, E.C.

The lower one shows the tube as delivered by the manufacturers, ready to be joined up. The method of procedure is as follows: the left-hand portion is smeared with a special lubricant sold in a tin and supplied with these tubes, which allow easy manipulation and facilitate the rendering of the joint air-tight. The right-hand portion is then turned in to the position shown in the dotted lines. Instructions to this effect will be seen in the illustration. The object of it being delivered in the position shown is to ensure the rubber being preserved when the tube is kept in stock for a long time. The already lubricated portion is pushed into place and pulled up, so that the contact faces are close together. The outer sleeve is then pulled over, adequately protecting the joint of the tube in the manner shown in the upper of the two sketches. The tube is now ready to be placed inside the cover and pumped up.

The manufacturers of the tube have had eleven years' experience, and the tube has now reached a high state of perfection. It, of course, possesses an advantage over other butt-ended tubes, in that there is always a free passage of air round the whole tube.



Rich detachable air tube in its latest pattern. See accompanying paragraph.

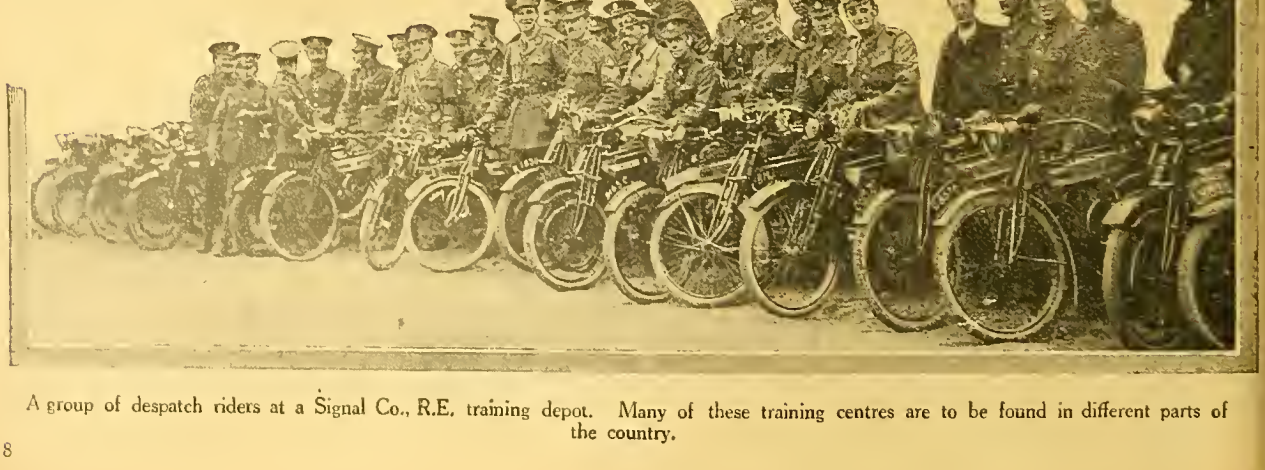
SEARLE UNBURSTABLE TUBES.

WE are informed by the Searle Unburstable Inner Tube Co., Ltd., Great Western Buildings, 6, Livery Street, Birmingham, that, in consequence of the large number of motor cycle tubes the War Office has been taking over from the firm, the output of Searle unburstable motor cycle inner tubes has been greatly extended, with the result that the cost has now been reduced by 25 %.

Searle tubes were used in the recent Irish twenty-four hours open trial by T. Toole (4¼ h.p. B.S.A.) and J. Doleman (3½ h.p. Rover), who gained gold medals, Toole also tying for the Rudge-Whitworth cup, and J. Browne (3½ h.p. Rover), who won a silver medal. None of these riders suffered from tyre troubles.

Repairs of Armstrong Three-speed Gears.

We hear that Messrs. Percival Bros. and Webb, Ltd., of 72, Moor Street, Birmingham, have decided to undertake repairs to Armstrong three-speed gears.



A group of despatch riders at a Signal Co., R.E. training depot. Many of these training centres are to be found in different parts of the country.

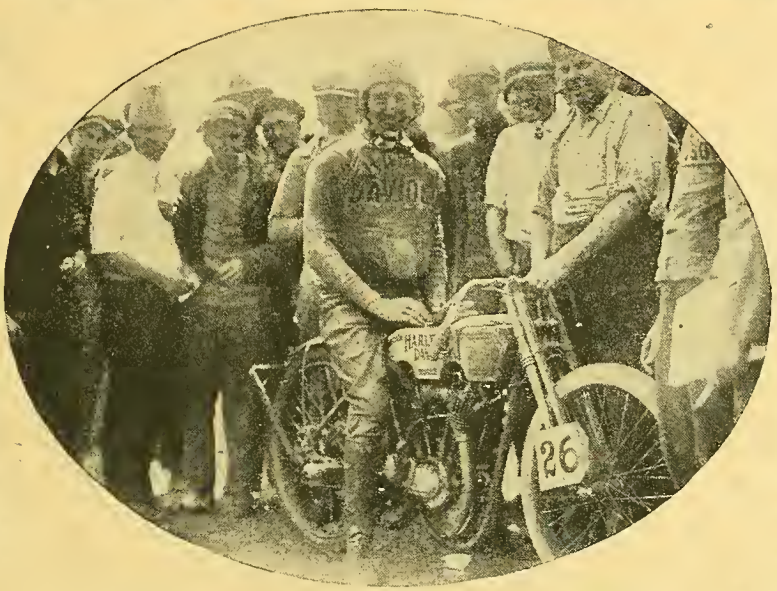
The heavy Military Traffic has simply played the "Cat and Banjo with the roads," writes E. N. Duffield in "Sporting Life"—quite so, and roads like that require

HARLEY-DAVIDSON

Stamina, Speed, and Power, in short—Harley-Davidson design, engineering, and workmanship

Finishes on Time and wins Medal in IRISH END-TO-END July 13th and 14th

In this two days' 500 miles Reliability Trial—The Harley-Davidson Model 11F. and sidecar (rider W. J. Henderson) proved superiors to the roads, correctly described "desperately bad" and a trial that was "considerably severe." The machine which can show such remarkable powers of endurance has substantiated its claim to Strength and Stamina beyond the normal



The man who broke all previous World's Records in International 300 Miles Grand Prize Championship Race, July 3rd.—Otto Walker—Time: 3 hours, 55 minutes 45 seconds—average 76 3/10 m.p.h. 6 Harley-Davidsons finished in first 7 places; 8 started. ALL BROKE WORLD'S RECORD

Wins 2 Gold Medals in Glasgow 12 hrs. Reliability Trial, July 3rd

Two Harley-Davidsons with sidecars were entered for this gruelling test. Both won Gold Medals. F. E. Martin rode 11F. Model with sidecar. Daniel M. Brash (Manager of The Harley-Davidson Scottish Agency, 98, Great Western Road, Glasgow), rode a 11J. (electrically equipped model) with sidecar. To quote from press comments, 'The Harley-Davidsons were most highly commended and did well'

On road and track, has put up an unapproachable reputation for RELIABILITY

The Road's the Test.—You may select the roughest and longest roads, hairpin bends and elbow corners, but—you will never be able to "take it out of" the Harley-Davidson.—For solo or sidecar work, in town or country—put it to the most strenuous test, the hardest possible "going," give it a real good "doing" and even then you will find no visible signs of wear in the vital parts of the machine. All parts of generous proportions, and built to limit gauge

Our Model No. 11J, for £76 13s., 7-9 h.p., 3-speed countershaft gear, chain drive, 28x3 tyres, electric pilot, head and tail light, electric horn, Brooks saddle, Renolds chain, together with full tool kit complete. Will do 60 miles to the gallon, and general maintenance cost is proportionately low. Built for strenuous work, having previously unheard-of speed and power, robust construction, free from faults and frailties, finished in Harley-Davidson grey, with nickel-plated parts on double coat of copper-plate—this is the machine of superlative excellence

We are here to give you all information possible about the Harley-Davidson Motor Cycle. Call, write, or 'phone—your enquiry will receive courteous and prompt attention

In answering this advertisement it is desirable to mention "The Motor Cycle." B21

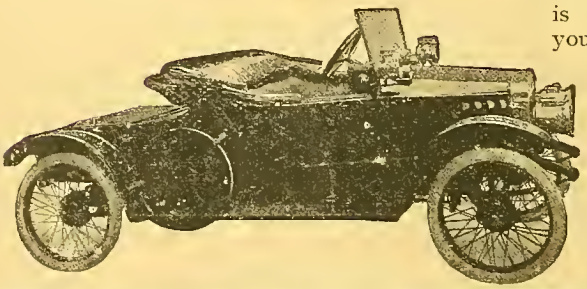
"Low running cost is one of the strongest points . . . in favour of the light car."

"The Light Car," July 7th.

ECONOMY

is one of the features of the

G.W.K.



light car which have made it so popular with owners. G.W.K. economy is not found in low price and inferior materials, but in simplicity of design, high-class workmanship, reliability and durability of operating parts, minimum oil and petrol consumption, long life of tyres, and immunity from repair expenses. Compared with a high-powered sidecar combination the cost of running is practically the same. The difference is that you get all the comfort and protection of a car. The need for economy is being urged by prominent statesmen. With a G.W.K. you can economise *without* curtailing your motoring pleasure.

Standard Model - - 175 gns.

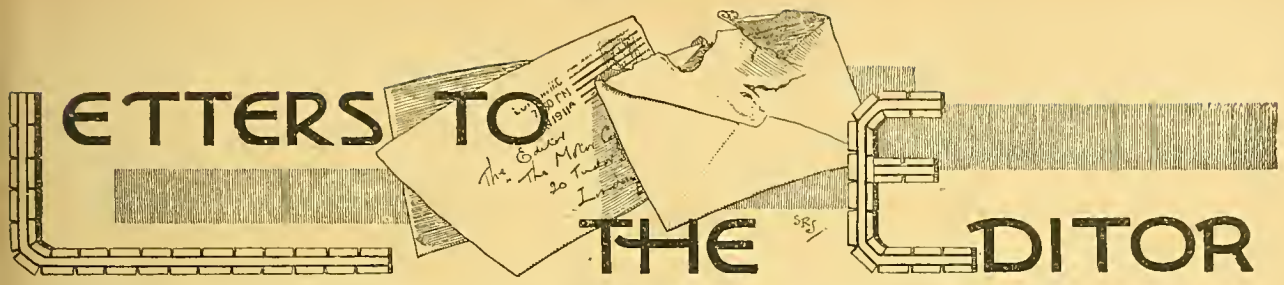
JOHN PIGGOTT, LTD.,
117 & 118, CHEAPSIDE, AND MILK STREET BUILDINGS,
LONDON, E.C.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

How to get to the Front.

Sir,—I have read in your last issue a letter from "Oilcan," and write to give him some information on the first question in his letter.

Applications for commissions (A.S.C.) will only be considered from men who have been right through the "shops," and have a thorough practical knowledge of all petrol engines.

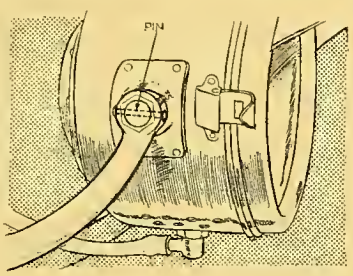
I may add I was unsuccessful owing to never having been in an engineering shop, although I have had seven years' experience with all makes of cars and motor cycles, and am no novice with the lathe.

The time taken from date of application to date of interview is roughly eight weeks.

I would point out to "Oilcan" that no difference, as regards qualifications, exists between the motor cyclist section and car section A.S.C. F.J.W.

Swivelling Lamps.

Sir,—I saw in last week's *Motor Cycle* a note *re* the soldering of a swivelling lamp. I do not consider this satisfactory, as the vibration is likely to shake it loose; and, unless done very neatly, it is bound to spoil the lamp. I have overcome the trouble by drilling with a $\frac{3}{32}$in. or $\frac{1}{8}$in. drill right through the bracket and nut, and riveting it, being careful to burr over the ends. This does not spoil the appearance of the lamp, and the rivet can be removed when things become normal.



T. CHICK.

Carbonisation of Two-stroke Engines.

Sir,—As a regular reader of your valued paper, I have seen from time to time numerous accounts of two-stroke engine behaviour, and also complaints of the rapid carbonisation of the cylinder heads and pistons. In this connection I think my experience will certainly prove a record. My New Hudson two-stroke, purchased in October last, has up to the present done over 7,000 miles without the engine being taken down once. The machine has been used solely for business purposes in the Black Country, and has had very heavy usage, and the carbon deposit is very slight from the amount one would expect after such a lapse of time, although the exhaust port is practically choked up. The engine has given every satisfaction, and is exceptionally powerful even in this condition, and I consider the reason for such splendid running is due to the amount of oil which I use. My oil consumption works out at fifty or sixty miles to the pint, which may seem on the heavy side, but when one takes into consideration the state of the engine and bearings it certainly seems most profitable to over-lubricate in this manner. My petrol consumption works out at 90 to 100 miles per gallon over very heavy country.

I beg to add the usual disclaimer.

E. VICTOR ABEL.

Improving the Consumption on a Two-stroke.

Sir,—In the issue of your paper dated July 15th there is, among other "Letters to the Editor," one from "N.B." thanking you for publishing an article on "improving the consumption of a two-stroke."

He refers with some enthusiasm to an arrangement which can be made to fit on the jet, made out of a valve from an inner tube and a needle.

I would be much obliged if you could give me particulars of the "tip" mentioned. I run a two-stroke myself, and anything in the nature of a petrol saving device interests me, but, as I missed your publication referring to the device, perhaps you will let me know when this was published.

FRANK LATIMER (Lieutenant).

[We have received many letters on this subject. The article was published on April 15th, page 377.—ED.]

Does an Engine Run Better at Dusk?

Sir,—I should like to suggest to "G.P.G.K." that the real reason for this well-known phenomenon is the rotation of the earth on its axis. Owing to this a road, which at noon lies quite level, will at dusk slope downwards at an angle of about 45°. This enables the machine to travel at a tremendous speed. At daybreak, on the contrary, the slope will be upwards, and it is this that makes it so hard to get up in the morning.

Of course I may be wrong. It may be CO_2 after all. If so, let us plug up our exhaust pipes to prevent the escape of any burnt gas, thus keeping the cylinder constantly full of undiluted carbonic acid gas. It will be found that the engine will then pull as well uphill as on the level.

By the way, talking about woodchucks, can anyone say:
While the "Two-stroke" *versus* "Four-stroke" controversy's to the fore,
When a "two-stroke" engine "four strokes" too, what does it "four-stroke" for? Y 2895.

Motor Cyclist Volunteers.

Sir,—I think it is about time someone entered a mild protest against the childish futility of the Motor Cycle Volunteer movement. At a recent hill-climb we had a beautiful picture of exquisitely garbed, athletic, young men playing themselves on their motor cycles the whole afternoon. A glance at a contemporary of yours shows some of this redoubtable force advancing to the attack. The picture bears far more resemblance to a party of exuberant Bank-holidayers on Hampstead Heath. Doubtless it was all very exciting, recalling as it would do memories of their not far distant days of hide and seek. They will learn considerably more of matters military by responding to Lord Kitchener's last appeal, and, in addition, will have opportunities for enjoying the finest of sports. One small group of irresponsibles took a great delight in exploding some toy pistol every time a certain competitor passed. Such conduct might have been the cause of an accident, by misleading the driver into thinking something had gone wrong with his machine. Their conduct struck me as being just on a level with the whole organisation—to wit, childish. M.B.

[As so many criticisms of others have appeared in the press from writers who themselves are not in the Service, we think it only fair to state that "M.B." writes from Aldershot, and holds a commission in the Army.—ED.]

Automatic Carburetters.

Sir,—I was much interested in reading "Ixion's" report on petrol consumption, and gratified to find he got much greater mileage when my carburetter was used; but, speaking of multi-jet carburetters generally, I notice he says that the small jets are liable to get choked up. This may be so on some; but on my latest carburetters the petrol is filtered after it leaves the float chamber, and has to go through copper muslin which will stop water passing; consequently, if your filter is in place it is an absolute impossibility for the jets to get choked up.

Regarding the enormous differences shown in the petrol consumption on a motor cycle and a motor car, as far as weight is concerned, this is easily accounted for in the design of the engine. If motor cycle engines were made with a smaller bore and a much longer stroke, and each connecting rod was on a separate bearing of adequate proportions, and had a proper flywheel, which it has not got at present, different results altogether would be got. The length of stroke I regard of extreme importance. The flywheel, of course, is a difficulty, as a flywheel 16in. diameter would be awkward to enclose, and would add a very considerable amount of weight to the motor cycle, which would be an objection, whereas it is not a great objection on a cycle car.

Referring to the long stroke question again, it is not surprising that the Norton 3½ h.p. single-cylinder with its long stroke should do such an enormous mileage per gallon.

I have dozens of letters from gentlemen who have this particular machine and who use my carburetter, and from which they say they get from 150 to 170 m.p.g.

C. BINKS, LTD.

Sir,—"Ixion" asks for experiences with the Claudel-Hobson carburetter. I have been using one of these carburetters on my 1909 3½ h.p. Triumph for nearly three years; in fact, I believe it was almost one of the first made for motor cycles. My machine weighs about 220 lb. in touring trim, and my weight is 12 st. The petrol consumption on a straightaway run usually is about 150 m.p.g. The controllability is greater than with any motor cycle carburetter I have ever used. There is no lack of power, as my machine will do about 67 m.p.h. The carburetter is of the 20 mm. size. Slightly better petrol consumption and acceleration at slow speeds could be obtained with a 17 or 18 mm. carburetter, which would be more suitable for ordinary use, but I wanted the maximum power outfit at extra high engine speeds. I should add that I have considerably altered my engine with this end in view.

As sent out the petrol damping screw at the top of the jet was adjusted for a four-cylinder engine, with the result that the mixture tended to get richer at high speeds. I overcame this by making a slightly longer hollow tipped screw to increase the damping factor. As I sent full particulars of this screw to Messrs. Hobson at the time, it is possible that they could supply the jets so fitted if they are to be used for a single-cylinder engine. The size of jet fitted in my carburetter is 95. This figure, of course, refers to the diameter of the jet in hundredths of millimetres and not in thousandths of an inch as is usual with English motor cycle carburetters.

The chief disadvantage of this carburetter is that it is not supplied complete and ready to fit; also it is expensive. I had to fit my own controls, for which I used a Bowden magneto control. I bought an elbow pipe from Messrs. Hobson for an induction pipe, and made a flange with a contracting ring and nut to attach to the inlet nipple. To this the induction pipe and carburetter are bolted. The flange nut supplied with the carburetter I reduced to a plain nut of half the thickness, and use it as a lock nut for the induction pipe, which screws on to the carburetter. For cold weather I have a hot air pipe, which collects hot air from round the exhaust pipe. Without some form of heating I do not think any carburetter can give satisfactory results in cold weather.

The only trouble I have had was that on one occasion the flat spring holding the float chamber lid slipped off, with the result that I lost the lid. To guard against this I got Messrs. Hobson to supply me with a spring having a knob on the top and a projection underneath as fitted to their car carburetters. The projection underneath engages with the lettering on the float chamber lid, thus preventing the spring from slipping off.

J. REED.

Overseas Prices.

Sir,—We notice in your issue of April 15th last a letter from "Interested" of this city, below which you append the local prices of several of the best known makes of motor cycles, extracted from "catalogues" sent to you by him. We are at a loss to understand how the prices of "Indian motor cycles" as published in your paper can be shown in any catalogue. We enclose our 1915 list, from which you will see that the prices here are altogether lower than those you published, namely, Indian 7 h.p., two-speed (South African cash price), £85 (not £91 17s. 6d.); Hendee Special (South African cash price), £100 (not £115 10s.)

The prices last year were the same as for this year's similar models, with the exceptions of the 7 h.p. single-speed and the Hendee Special, which were £2 10s. and £7 10s. higher respectively.

We trust in fairness to us you will give this letter the same prominence you gave to that from "Interested," whom, by the way, we should be very pleased to interview at our depot to discover the cause of these curious errors.

WILLIAMS, HUNT AND CO.

Johannesburg, S.A.

The Business Man's Sidecarrier.

Sir,—Reading between the lines of your leader on this subject, one can see that the writer regrets the conservatism of the average Britisher, and also, perhaps, regrets that the efforts of *The Motor Cycle* to popularise the use of the side-carrier have met with rather poor results. I am only a working farmer, but I can assure you that I, at any rate, appreciate your efforts, and, in the hope that I may be of some use to the "movement," I purpose telling my own experiences in the use of a motor cycle and sidecar.

Towards the end of 1913 I purchased a 3¾ h.p. 1911 Kerry-Abingdon two-speed and sidecar. This outfit was geared 4½ and 8 to 1—too high for sidecaring in Cornwall! However, I made this do for some time, serving my novitiate. Then I sold it. Up to this time (March, 1914) I had used a pony and trap for taking goods to market and for the usual light work connected with a farm. I now, however, made up my mind to sell out and invest in a motor cycle and sidecar, making it do *all* my work previously done by the pony, etc. To this end, I purchased a 4¼ h.p. Sun-Precision S.A. three-speeder, new. I attached a roomy wicker sidecar to this. My gear ratios are 4½, 6½, 10½ to 1 (approximately). This outfit has, since April, 1914, done the whole of my light carrying. This includes delivery of feeding stuffs, sporting ammunition, parts of agricultural machinery, etc. Every Saturday morning, without once failing, I take my wife with her dairy and farm produce to catch the 7.35 train to Plymouth. Frequently my load has been nearly 4 cwt.; distance to station, two and a half miles. Recently I brought back from the station 2¼ cwt. of sporting cartridges. Distance run to date over 3,000 miles. As yet I have had no punctures. The same tyres are still in use. The outfit has been used in all weathers, and through the winter I have had many a bitter drive. Up to date, I have had the following stops: (1.) Slipped timing magneto; fifteen minutes delay, torrents of rain and nearly dark. (2.) Sparking plug shorted owing to central electrode working loose. I frequently take my wife and two little girls, age six years and four years, for a spin. The engine takes the hills splendidly. I have only once met my Waterloo, and then I think it was my own fault and not the engine's. I have had more solid enjoyment out of the machine in a year than I should have got from a horse in twenty years. Apart from this, the saving of time is very great. I can truly say that I am more than satisfied. I find the motor cycle much more economical than a pony outfit. I have done seventy miles with a 200 lb. passenger (I weigh 150 lb.) on one gallon of benzole.

You probably know what our Cornish roads are like. Hills all the time, and, taking this into consideration, if a motor outfit succeeds here surely it should be an unqualified success in the more level parts of the country. I find I can do most of my repairs myself, although the little I know of mechanics I have picked up gradually.

I always do what I can in advising my farmer friends to invest in a motor as I have done, but they all seem afraid that "the bally thing might bust!"

The .. Harcourt Radiators

THE PERFECTION OF AIR-COOLING.

The Harcourt Radiators maintain the full efficiency of engine under the worst conditions: OIL CONSUMPTION HALVED, OVERHEATING ABOLISHED.

WHAT USERS SAY.

The Rev. T. Walton, Hoddesdon, Herts., September 5th, 1914.

(1911 T.T. Triumph with sidecar.) "I have now given your radiators a thorough trial during the summer, and find them thoroughly efficient, and doing all that you claim: less lubricating oil, more power, cooler running. I took my exhaust valve out yesterday after the summer's run, and it scarcely needed grinding in."

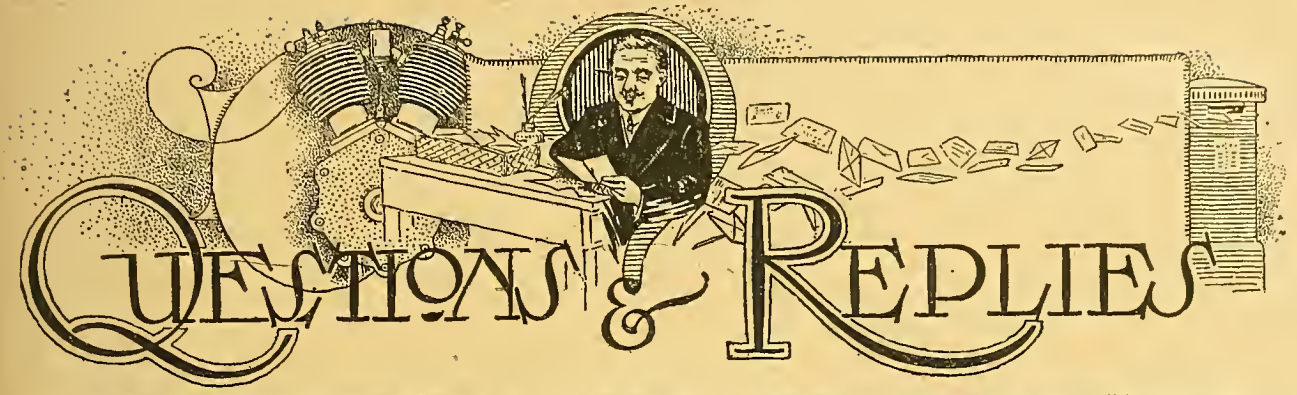
THE BIG TWIN

THE POPE MOTOR CYCLE AGENCY,

Telephone—London Wall 1137. **55, BANNER ST., E.C.** Telegrams—"Acarobox, London."



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Speedometer Readings.

I shall be much obliged for your help in the following matters: I have removed my speedometer from my old machine, which had 26in. × 2¼in. tyres, to my new Williamson, which has 26in. × 3in. tyres. Will you please tell me precisely how much per cent. it now reads slow?—W.G.

There should be no difference in the reading of your speedometer, but owing to the fact that tyres do vary occasionally, if there is a difference the speed shown will be in inverse proportion to the diameter of the wheel.

Slipping Clutch.

I have a 1914 6 h.p. machine with a two-speed Roc gear. I have ridden several thousand miles, and had no trouble with the gears, merely adjusting them when necessary, but now the top gear slips on the slightest gradients. Does it require a new pin or washing out with petrol? If the latter, will you please inform me how? I might say the adjusting pin is not quite at the end of the thread—about two threads left.—H.C.

We should advise you to wash out your gear with paraffin. To do this the paraffin must be run through the gear at every available opening, until it runs out practically clean, after which the gear should be oiled. You can then decide if a new plunger is necessary.

Oil Leakage.

I have a 3½ h.p. machine. Oil leaks out behind the pulley through the ball bearing, and is thrown over the belt, etc. The spindle is not quite true, so that a tight fit with the crank case cannot be made. I have tried a leather washer on the outside without effect. I have at present got the crank case apart, and am thinking of putting a felt washer between the bearing and the crank case. Can you suggest any other method? Is there any belt which is not harmed by oil?—F.W.I.

We should strongly advise you to have the mainshaft carefully trued up and an extra relief valve fitted. We do not advise a felt washer between the bearing and the crank case. See page 61 (July 15th), where you will find a tip to prevent oil splashing. A leather belt is not harmed by oil.

Valve Lift.

My present 3½ h.p. engine has a maximum valve lift of ⅛in. Is this correct? I am rather doubtful on this point, since the machine will not take me up steep hills without knocking, and in many instances stopping. In all other respects the engine appears to be in perfect order.—W.S.

The valve should lift about ¼in. Carefully examine your tappet clearance, and also see that the cams are not worn. If these points are looked to we think you will find a great improvement in the running of the engine.

Faulty Lubrication.

I have been troubled with unequal oiling in the crank cases of a 1914 Scott fitted with the usual sight feed lubrication, and I should very much like to know if you or any of your readers have experienced the same thing and have found a way to remedy it. After seeing that the levels in the crank cases were the same, I rode sixty miles, and then found that the level in the right-hand crank case was about half an inch below the door, and in the other had fallen nearly to the bottom of the sump, the big end was hot, being almost dry. I find there is considerable wear in the small end bushing, and the engine is inclined to knock at high speed. The lubricator is adjusted to take one pumpful every five miles.—GREASER.

The trouble you have with unequal lubrication in the cylinders of your engine is, in all probability, due to a choked oil feed pipe. We advise you to unship the left-hand feed pipe from the sight feed to the crank chamber, and clean out with petrol any dirt deposit that may exist in the pipe. At the same time, also, squirt out with petrol or paraffin any dirt that may exist in the oil channel leading directly to the left-hand crankshaft bearing. We have known of cases in which insufficient lubrication has developed through a leak in the union on the oil feed pipe. Perhaps the union on your engine has slackened off. The wear in the connecting rod small end bush is directly due to insufficient lubrication, as, owing to the piston always being under compression on the connecting rods in this engine, the small end bushes are normally free from knock for long periods, if the lubrication is correct.

The International Pass.

I hold a motor licence here in Havre, but desire to spend a month in England and to bring my motor bicycle over with me. What should I have to do with reference to licences, etc., as, naturally, I do not want to pay in full for just one month?—F.G.

Your best plan would be to apply for an International Pass from the Touring Club de France, 4, Avenue de Villiers, Paris, or from the Automobile Club de France, 8, Place de la Concorde, Paris. They will supply you with an F *plaque* and the necessary papers for about 10 fr., which will exempt you from taking out licences for one year in England.

Compression Ratio.

Will you kindly inform me of the amount of compression space, which should be allowed in a small four-stroke engine, with overhead valves (a.o.i.) 57 × 70 mm., with outside flywheel, and which I intend to use for a light-weight motor cycle? The inside of the cylinder head is flat, and the head, together with the cylinder, is held in position by two long bolts to crank case. What would be the approximate h.p.?—J.T.W.

A 2¼in. × 2¾in. engine = 57 mm. × 70 mm. = 219 c.c., which should approximately equal 2 h.p. The compression space should be about 50 to 70 c.c. The former will give a fairly high compression, the latter a medium one.

The Local Taxation Licence.

I hold a £1 revenue licence for a motor cycle, and having sold mine and bought a 9 h.p. Swift car, I should like some advice as to how I should proceed for having the £3 3s. reduced by the £1 paid for the motor cycle.—W.R.J.

Inform the licensing authorities that you hold a £1 local taxation licence for your motor cycle, that you have bought a car, for which the tax is £3 3s., and that you presume you are in order in sending a cheque for £2 3s. We think they will accept this without trouble. Perhaps you had better enquire at your local P.O., and if any reluctance is shown to conform with this suggestion, write direct to the London County Council, Local Taxation Licences Branch, 40, Craven Street, Strand, London, W.C.

A Question of Age.

I am fifteen years and three months old. Does the law allow me to drive: (1) An 8 h.p. three-wheeled Morgan Runabout, (2) an A.C. Sociable, (3) a 6 h.p. motor cycle and sidecar?—M.S.

The law would allow you to drive any one of the machines referred to in your letter provided it is registered as a motor cycle. You are not entitled to drive a vehicle bearing car numbers, which is legally a motor car and not a motor cycle, until you are seventeen years of age.

Decarbonising.

(1.) Would you recommend me to use scrapers for removing the carbon from my Douglas through the holes above the valves? If so, what are these instruments called, and where could I get them? (2.) I have two spare inner tubes. How should they be kept so as to preserve them—flat or blown up?—R.D.H.

(1.) There are numerous scrapers on the market, obtainable from the large accessory firms. In ordering, however, it should be distinctly stated that they should pass through the valve ports of a Douglas motor cycle. As a matter of fact, a suitable scraper can be made from a worn hacksaw blade, which may be softened by heating and bent to the required shape. They may be a little difficult to use owing to the narrow space in which you have to work. (2.) For carrying on the machine an inner tube should be kept flat by folding the tube in half, removing the inner part of the valve and rolling it up. When you have rolled it up as far as the valve, and all the air has been excluded, replace the inner portion, and the tube may then be folded flat, or else wrapped round the handle-bars and tied into position with a tape or strap. For storing at home we prefer to inflate slightly, and keep the tube wrapped up in a spare cover.

Increasing the Speed.

I have often read that drilling the piston and connecting rod greatly increases the speed of a machine, but surely this must upset the engine balance. I have never noticed this matter mentioned. Could you let me know how to re-balance the engine if drilling the piston, etc., upsets it? I also presume that placing thin copper tubes through the radiating fins of the cylinder would tend to keep the engine much cooler.—G.H.

Any steps taken to lighten the reciprocating parts of the engine will increase the speed thereof. It is quite possible by this means to upset the balance, but those who undertake the lightening of the reciprocating parts are careful to re-balance the engine correctly. We publish a special pamphlet on balancing, entitled "The Balancing of Motor Cycle Engines," which may be obtained from these offices, price 7d. post free. Placing thin copper tubes through the radiating fins would be of some assistance to cooling.

Inner Tubes.

I have a 1914 3½ h.p. machine, and have had trouble with the inner tubes in the back wheel splitting. The outer cover is a 26in. × 2⅝in. to fit a 2¼in. rim, and the inner tube a 26in. × 2¼in. I was recommended to try a larger inner tube, but was unable to procure a 26in. × 2⅜in., and was therefore persuaded to purchase the next size, a 26in. × 2½in. to fit a 2¼in. rim, which I was informed would answer my purpose. Would you kindly advise me if there is any danger in running with a tube a size larger than the outer cover?—R.M.

There is no harm in fitting a tube which is slightly too big provided that it is not creased when put into the cover. The splitting seems to indicate that the tube has been kept too long and that the rubber was inclined to become perished.

EXPERIENCES WANTED.

"C.D.R." (Ramsey).—Omega, O.K. two-stroke, Mark V. two-speed. Reliability, hill-climbing, frequency of cleaning, and general cleanliness of engine.

"A.E.S." (Nottingham).—Experience of speedometers fitted to two-stroke Triumphs. Vibration of needle.

"W.H.S." (Edinburgh) and "H.W." (Hounslow).—We regret that we cannot recommend the pulley you name, so we refrain from publishing your request.

ROUTES.

BRISTOL TO DONCASTER, avoiding heavy traffic, and mileage.—C.E.B.

Bristol, Tormarton, Acton Turville, Malmesbury, Cricklade, Faringdon, Oxford, Kidlington, Brackley, Towcester, Northampton, Kettering, Stamford, Grantham, Newark, Tuxford, Retford, Doncaster. Approximately 212 miles.

CARDIFF TO COLWYN BAY.—O.W.N.C.

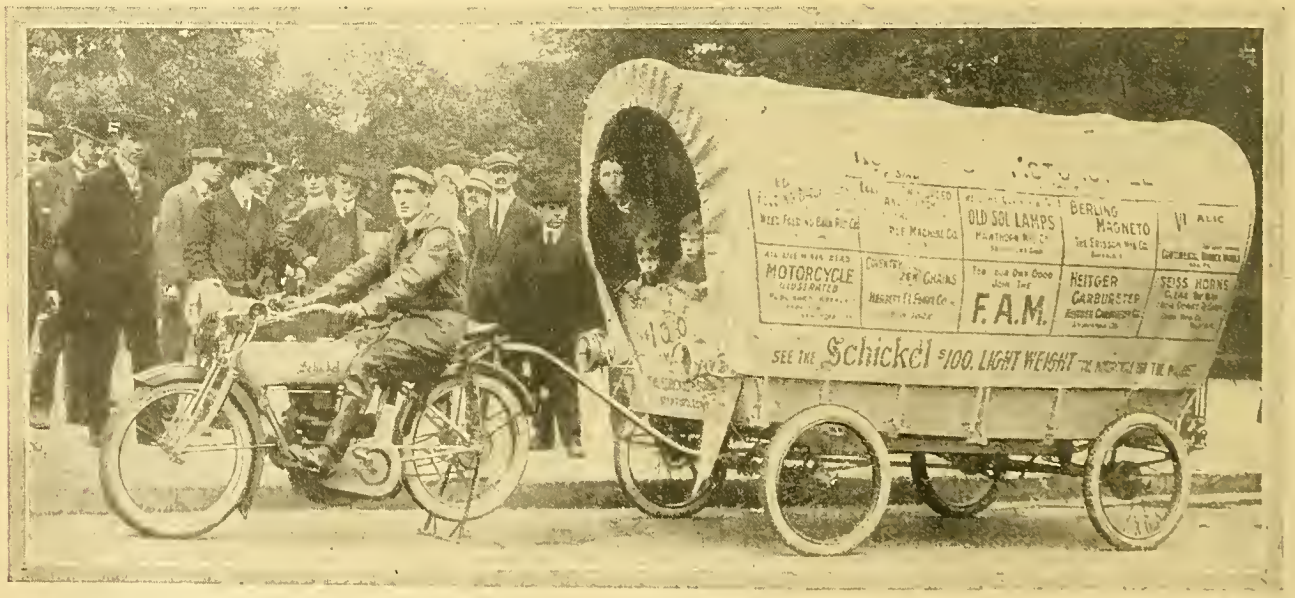
Cardiff, Newport, Pontypool, Abergavenny, Hereford, Leominster, Craven Arms, Shrewsbury, Ellesmere, Overton, Wrexham, Mold, St. Asaph, Abergele, Colwyn Bay.

WALSALL TO SOUTHAMPTON, avoiding roads cut up by military traffic.—G.H.H.

Walsall, Birmingham, Henley-in-Arden, Stratford-on-Avon, Shipston-on-Stour, Enstone, Oxford, East Ilsley, Newbury, Whitchurch, Winchester, Southampton.

CHATHAM TO READING AND CIRENCESTER, avoiding London, and approximate distances.—R.T.D.

Chatham, Malling, Brasted, Westerham, Redhill, Reigate, Dorking, Guildford, Farnham, Odiham. Reading, Goring, Wantage, Faringdon, Lechlade, Fairford, Cirencester; 94 miles to Reading, and 150 to Cirencester.



A remarkable motor cycling outfit on which an American rider and his family recently set out to cross the continent to the San Francisco Exposition. The four-wheeled trailer, which provides accommodation for the family, is hauled by a 6 h.p. single-cylinder motor bicycle.

MISCELLANEOUS ADVERTISEMENTS.

IMPORTANT NOTICE.

Owing to the August Holidays, the issue of "The Motor Cycle" for August 5th must be closed for press earlier than usual. All copy and instructions for Miscellaneous Advertisements in that issue must therefore be in our hands not later than first post on Thursday, July 29th.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Triumph, or 7h.p. Indian in part payment.—Letters only, B. H. Davies, 15, Royal Terrace, Northampton. [X2466

TRUMBULL Light Cars, the most economical, quietest, fastest, most powerful light car on the market. Complete with 3-speed gear, hood, screen, electric lamps, 4 detachable wheels, £110; spare wheel extra £5.—Apply for trial run (distance no object) to George Clark, Motor and Carriage Works, Arrow, Alcester; or Frank Heath, Rushford Garage, Salford Priors, Evesham. [X2597

CARS FOR SALE.

FORD 1913 Touring Car; £75; any trial here.—21, Tindal St., Chlemsford. [9170

PALMER'S Garage, Tooting.—14-16h.p. Singer touring car, 4 cyls., gate change; £85.

PALMER'S Garage, Tooting.—12-14h.p. F.I.A.T. landaulets, three immediately available; prices £175, £200, £225.

PALMER'S Garage, Tooting.—12-14h.p. F.I.A.T. chassis, suitable for 2-seat., 4-seat., delivery van, etc.; £125.

PALMER'S Garage, Tooting.—Four 12-14h.p. F.I.A.T modern 15 cwt. delivery vans, immediately available; £150, £175 each.

PALMER'S Garage, Tooting.—14-16h.p. Gladiator cab-landaulet, 4 cyls., gate change; £65.

PALMER'S Garage, Tooting.—24-36h.p. S.P.A. chassis, gate change, powerful lot, £85; also 28-36 h.p. Daimler chassis, £65.

PALMER'S Garage, Tooting.—10h.p. De Dion, modern type, 4-seat., bargain £50; 12h.p. Sizaire sporting 2-seat., fast; £35.

PALMER'S Garage, Tooting.—14-16h.p. light Argyll 4-seat., runs like new; £85.

PALMER'S Garage, Tooting.—15h.p. K.R.I.T. touring car, £110; 12-16h.p. Star 2-seat., £55.

PALMER'S Garage, Tooting.—10-12h.p. Darracq 2-seat., £27/10; 10-12h.p. Opel Darracq cab landaulet, £27/10.

PALMER'S Garage, Tooting.—15-20h.p. Flanders 4-seat., nice order, accessories; £85. [9352

HUMBER, 10-12h.p., 4-cyl., 1906, 2-seat.; £32/10.—Marshall, Castle St., Cambridge. [X2493

1914 Singer Light Car, dynamo set, complete lamps, speedometer, etc.; £165.—Cross, Agent, Rotherham. [X2569

PHŒNIX 2 or 3-seat. Car, 8-10h.p., mag., Stepney, lamps, all complete; £40.—Buckingham, Tindal St., Chelmsford. [9171

DARRACQ, 10-12h.p., 1908, 2-seater, dickey, lamps, Stepney, head lamp, just been thoroughly overhauled and re-painted; £30, or exchange.—Below.

ARGYLL, 10-12h.p., mag., 2-seater, dickey seat, quiet running, gate change, painted yellow, lamps, Stepney, all tyres splendid; £27/10.—Butterworth, Garage, Mill Lane, Brixton Hill. [X2454

8-10h.p. J.A.P., Multi gear, new tyres and tubes, 2-seat, and dickey, fine condition; £70, or exchange.—Dawson, 60, Regent St., Cambridge. [X2659

ALLDAYS, 10-12h.p., smart side entrance, mag., hood, screen, lamps, etc., good order; £30, bargain; part exchange modern lightweight.—96, Crown St., Ipswich. [X2622

10h.p. Hurtu Light Car, small 4-seat, torpedo body, hood, screen, side curtains, Stepney, 5 lamps, this is a grand little car, in perfect order, 35 miles per gallon guaranteed, and a real bargain at £110.—Leavis, Downham. [9157

SAXON and Ritz Light Cars at motor cycle prices. 4-cyl., water-cooled, 2 speeds, reverse, hood, screen, all on, 100 gns. and £120 respectively; motor cycles in part exchange; deferred payments; promptest delivery.—Lamb's, 151, High St., Walthamstow. [0533

THE

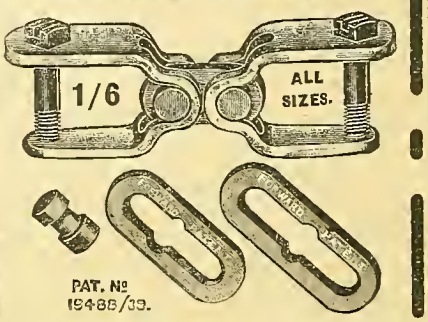
BEST of EVERYTHING

has to be fitted to Motor Cycles

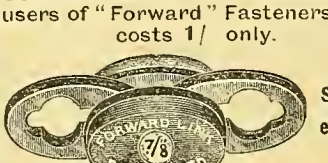
for the WAR.

That is why all the leading machines are being fitted with reliable

'FORWARD' Fasteners

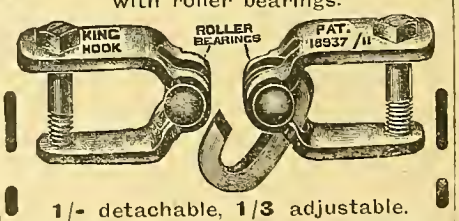


THE "FORWARD" Leather-covered Link is invaluable to users of "Forward" Fasteners, and costs **1/** only.



ALL SIZES, except

A Reliable Hook Fastener is the "KING HOOK" with roller bearings.

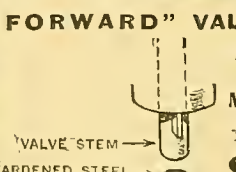


1/- detachable, **1/3** adjustable.

"KING HOOK" Leather-covered Link, the only make that will fit all our hook fasteners.

10d. each.

"FORWARD" VALVE STEM ADJUSTERS.



Made in 3 sizes. 5/16" 3/8" and 7/16"

6d. the set of four.

1/- the set of eight.

SIMPLE YET PERFECT.

FORWARD MOTOR CO.,
SUMMER ROW, BIRMINGHAM.
Makers of "Forward" British Plugs.

CARS FOR SALE.

1914 R.M.C. 2-seat., double dickey, Brolt starter, Rushmore lighting set, detachable rims, spare, 3,000 miles only, been well kept; any trial; £185.—Leavis, Downham. [9159

1913 5-seat. Ford, just re-painted and overhauled, Stepney, Master vibrator, best electric head lamps, 2 new covers and tubes just fitted, speedometer, etc.; £85.—Leavis, Downham. [9158

BARGAIN.—28h.p. Daimler brake, mag. ignition, 4-speed forward, chain drive, detachable rims, in perfect order; £80; would take cheap sound landaulet part.—Ward, Stoke Ferry, Norfolk. [9117

EXTENDED PAYMENTS.

EXTENDED Payments.—All makes supplied; lowest terms.—Service Co., 292, High Holborn, London. [0618

PAYMENTS by Instalments, any make of motor cycle or car. Details arranged to suit customer.—Colmore Depot, 49, John Bright St., Birmingham. [8105

ENGINES.

F.N. Engine, 5-6h.p., complete with clutch.—Roberts, Lisvane, Ebbw Vale. [9059

PRECISION Spares.—Sole London stockists, Grandex, 83, Gray's Inn Rd., W.C. [3235

6h.p. Rex Engine, mag., and back wheel; £9, or offers.—Dinnage, Amberley, Sussex. [X2023

3½h.p. Ariel Engine only, splendid condition, £5; B100 saddle, as new, 10/-; 7ft. 6in.×2½in. Whittle belt, 7/6.—J.B., 12, Albion Place, Winchfield, Hants. [9204

6h.p. Twin Brown Engine, complete with inlet and exhaust pipes, new bearings throughout, perfect condition; £8/10.—Boyle, 75, Osborne Rd., Forest Gate, E. [9255

8h.p. J.A.P. Engine, 1912, perfect, re-bushed, Bosch waterproof mag., Binks carburetter, £17; new 500 cc. Spack engine, single-cyl., Bosch mag., £13.—1a, Bloomfield Rd., Plumstead. [X2436

8h.p. New J.A.P. Twin, air-cooled, £18/10; new Premier 4h.p. twin, mag., carburetter, silencer, £12; 4½h.p. Stevens, single-cyl., splendid condition, £6/10; 3½h.p. Minerva, m.o.v., £4; 3h.p. N.S.U., £3; 3½h.p. Rex, £3/10; new J.A.P. cylinders, 70 mm., 76 mm., 90 mm., 20/- each.—Murray's, 37a, Charles St., Hatton Garden, Holborn. [X2637

IGNITION APPLIANCES.

U.H. Magneto, single; £2/10.—Cliff and Son, Eltham. [9196

PARKER and Rice, Magneto Specialists.—Experts on all magnetos, Bosch, Eisemann, etc.

PARKER and Rice.—Re-winding, re-magoetising, overhauling, etc.; repairs executed with expedition and unapproachable workmanship; low quotations.

IMPORTANT.—Parker and Rice give 12 months' written guarantee with each repair.

PARKER and Rice, John's Place, Kieg St., Acton, London.—State your trouble. Let us quote you. [4292

SEND Your Magneto Repairs to the Runbaken Magneto Co., Ltd., Camp Street Works, Deansgate, Manchester. 'Phone: 8266 City (3 lines) T.A.: Runmag, Manchester.

REPAIRS.—The Runbaken Magneto Co., Ltd., have the largest and best equipped works in this country for dealing with this class of work. Moderate charges. Can return within 24 hours.

SPARES Department.—We can supply from stock all spare parts for Bosch, Eisemann, Mea, U.H., etc. Send for illustrated booklet.

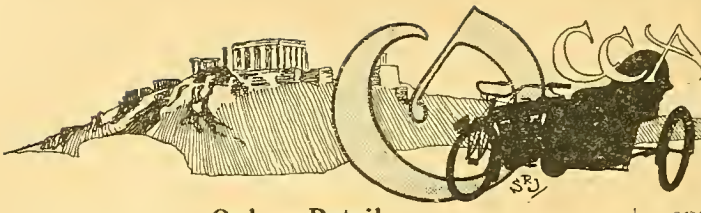
Single-geared Machines and Hill Climbing.

MOTOR cyclists may be divided into two classes, those who search for hills, and those who seek to avoid them. It is a curious statement to make in these days of the motor cycle industry, now, roughly speaking, twelve years old, but there seems to be a distinct increase in the number of readers who ask us for routes and who specially mention that they wish to avoid hills. It is inconceivable to the owners of the most perfected high-class machines that motor bicycles should exist which will not climb any main road hill in the kingdom. The average rider has every right to expect any machine of well-known make he purchases not only to take every main road hill in the country, but to enable him to do a little mountain climbing off the beaten track, where he may get "far from the madding crowd" and enjoy the beauteous views which cannot be reached otherwise.

The state of the roads at the present time, damaged as many of them are by military traffic, often entails the traversing of avoiding routes which are exceedingly hilly. Take, for instance, the road from London to Exeter. The roads through Salisbury, Amesbury, and suchlike military centres are in places unrideable, but, apart from this, the scenery on these roads is poor in comparison with that by the coast road through Bridport and Lyme Regis. From Dorchester onwards there are numerous steep ascents, none of which, however, should cause the least anxiety to the rider of a 1915 model. This particular road happens to be the only one we can recommend to the west country, and we do not doubt for a moment that eventually complaints will come in that we have recommended a certain road the hills on which are unclimbable by modern single-geared lightweights. Again, the Exeter-Okehampton-Launceston-Bodmin road, never very good as far as Okehampton, is reported to be in bad condition, and the alternative route over Dartmoor, *via* Moretonhampstead and Tavistock, is one succession of long and steep hills, or if a detour is made *via* Plymouth the road is by no means level, and the Hamoaze has to be crossed by the Torpoint ferry. Such instances could be increased if necessary.

The Motor Cycle has done so much to introduce the necessary change-speed gear to motor cycles, and its efforts have been crowned with so much success, that, for the last two years or so, very few single-geared heavyweights were made. Yet now, in 1915, it is with considerable surprise that we have to record that makers are actually listing low-powered single-geared machines which should have at least three speeds, and the public buy them, thinking that they will go anywhere and climb any hill that may be encountered. It is up to the prospective motor cyclist to bear in mind that the lower powered the machine, the greater the necessity for a change-speed gear, and, further, the smaller the engine the more gears are necessary. If it is found desirable that the 3½ h.p. machine should have three speeds, it is all the more desirable that the 2¼ h.p. should have four speeds. Four speeds are perhaps too many to expect in the case of a cheap lightweight, but three at least are required, while, of course, two are immeasurably better than one. The prospective purchaser should therefore remember that his new mount should be capable of taking him anywhere within reason. He will often buy with the object of travelling not more than sixteen miles an hour, and never taking a journey longer than twenty miles in length, but such are the fascinations of the pastime that it is not many weeks before the tyro is touring far afield and driving his machine within a very little of its maximum power. It is the duty of the buying public, therefore, to see that they get machines which will enable them to enjoy, to the fullest extent, touring in this beautiful country of ours.

An index to the advertisements in this issue will be found on the page facing the back cover.



OCCASIONAL COMMENTS

BY "IXION"

Only a Detail.

In the dim pre-historic past of the motor cycling era you could always identify a motor cyclist by the abrasions on his hands. Every machine on the market was made of assembled bits, and such items as the valve lifter and brake handles were bought by the hundred and screwed into place with spiky brackets, sharp-edged nuts and bolts, and not infrequently miniature little bayonets and *chevaux des frises* in the form of spring catches. The rigid forks and unbalanced engines kept the driver's hands in a state of violent and perpetual vibration, until at last his hands became so calloused and scarred that further wounds could not be inflicted by any smaller tool than a steam hammer. We pioneers were a sturdy and long-suffering race; we had undergone similar tortures on the earlier push-bicycles, and we knew that as each manufacturer settled down to construct his own machine from stem to stern, he eliminated these petty worries, and gave us smooth handle-bars with rotund fittings. The same process, we fondly imagined, would be followed with motor cycles, as they developed. We were fools. After nearly twenty years, many motor cycle manufacturers still bolt on the spikiest fittings imaginable. I know I can wrap the offending protuberances in insulating tape, and so rob them of their marked resemblance to barbed wire entanglements; but I cherish a deep and sullen resentment against the fool designer who is responsible; and there is more than one of him.

The Haunting Misgiving.

I am nothing if not frank, so let me confess that dynamo lighting reminds me to some extent of the early days of motor cycling, when every ride was tempered with the cynical expectation that ere long one's timing gear would shear, or one's contact breaker drop off. I was once driving an electrically lighted car by night over strange roads, when the capricious dynamo seized on a blind corner in its spite, and plunged the world into darkness without a moment's warning. Never did two human feet descend on clutch and brake pedals with more weight or abruptness; and this is surely the main weakness of electricity as an illuminant. Acetylene gas usually heralds a fit of misconduct by evincing a fit of the jumps, unless, of course, you have been fool enough to mount your rubber pipe where a knee-twitch may pinch it, or a swing tangle it in the front wheel. But electricity always acts with the mobility of a jerboa. At 11h. 57m. 43s. the road is bathed in brilliant light for half a mile ahead; at 11h. 57m. 43.5s. you find the world has disappeared into Stygian darkness; and your safety may depend on whether the surroundings are wide and straight, or whether your mental retina retains sufficient impression of what lies ahead to give space for a safe stoppage; or on the happy chances that protect us poor fools of motor cyclists in hours of peril. Such appalling incidents are, of course, few and far between. I can only recall one instance of a smash due to this ever-present possibility; and in my own experience of the kind I emerged scathless.

Electric Outfits on Test.

So far I have experienced no trouble whatever with my electric lighting sets, apart from the batteries, which, being new, run down extremely fast—faster, indeed, than I am able to repair by dynamo charging. Each of them has been removed from the machine on two or three occasions to be charged up at a garage. When the cells settle down, I hope that the dynamos will be able to keep the voltage up to the proper level, though, judging by present experiences, I rather think it may be necessary to keep them on charge during the bulk of my day work whenever the lamps are in regular use. A neighbour of mine, who is using a Lucas outfit on a big sidecar combination, has not yet experienced this difficulty, owing to the fact that his battery, being stored in the sidecar, is altogether more substantial and capacious and the dynamo is able to keep it up to the mark. His sole trouble has been a broken head lamp lead, due to the fact that he did not bind the wire to his top tube at a point near the lamp socket, and the long sag he left in it caused a fracture through excessive sway. He has now taped this up and is happy.

A Trade Innovation.

I notice with some irritation that the trade—or a large section of it—has suddenly ceased to supply tyre repair outfits as part of the standard kit. I have taken delivery of four new machines during 1915, comprising three different makes, and in no single case has a tyre repair outfit figured in the equipment. Of course, these details are conventional. Nobody expects to discover spare valves, sparking plugs, and belts or chain bits—[Spare links are supplied on at least one chain-driven, two-speed machine.—ED.]—in the panniers of a new machine. But the practice of supplying sundry essential fitments—for example, a few tools, a tyre inflator, and a tyre repair kit—has stereotyped into little short of actual law; and I wonder much what secret cabal has suddenly deprived us of goods to the value of half a crown or so? I suppose the guilty firms will be able to justify their innovation; but they ought at least to make it public property, and so I supply their omission; for have I not twice in this year of grace been overtaken by the puncture fiend on my first trip with a new mount, and has there not been a loud crescendo in my curses, as to the knowledge of a flat tyre was slowly added the far more disquieting information that my kit contained neither patches nor solution? Perhaps the Government has bought up the whole supply for repairing aeroplane tyres! It might seem so, for the solution in the last two repair kits which I procured from local agents to complete my panniers contained a caricature of solution resembling ancient ink eraser, which had evidently mouldered in stock and dried up completely.

A TRIP INTO KASHMIR
on a motor cycle.

By G. R. H. Talbot.

I HAD long meditated making a trip into Kashmir, but, owing to its great distance from the eastern side of India, it was some time before I had an opportunity of doing so. However, at last I was able to get away for eleven days, and accordingly I set forth from Calcutta by the East Indian Railway Punjab mail train.

April is one of the hottest months of the year in Calcutta, and I was greatly looking forward to the prospect of being shortly in a climate comparable to that of England. The journey was a long and hot one, and beyond passing through some of the most important towns in India, *e.g.*, Allahabad, Cawnpore, Umballa, and Lahore, there was little of interest to be seen.

The Delights of a Cool Climate.

Umballa, a large military station, was reached at about six o'clock in the morning, and it was necessary here to transfer to the North-Western Railway train, which left about an hour later. Thenceforward to Lahore the journey was, if anything, of even less interest than the previous portion, the country traversed consisting mainly of dried-up rice fields. A somewhat protracted stop was made at Lahore for luncheon, or "tiffin" as it is called in India, but eventually the train got going again. Towards evening there was a marked drop in the temperature, and this continued as the train rolled on its way through deep cuttings and tunnels, gradually getting into much higher country until Rawalpindi, 2,000 feet above sea level, the base from which my journey was to be made, was reached at about eight o'clock on Monday night. It was, indeed, a relief to find that here there was at present no need for the punkah or electric fan. In Calcutta one has to start using fans about the middle of February, but in Rawalpindi the hand-pulled punkah is not brought into use until June. I was glad to get out of the train, as I had been travelling almost continuously for two days and nights, and had come almost 1,400 miles, and after seeing my luggage and machine, a free engine Triumph, safely on to the platform, I managed to get dinner of a sort at the station. After this I went to search for an hotel, and found one near the station.

A Long and Tricky Climb.

The distance from Rawalpindi to Srinagar, the capital of Kashmir, is, roughly, 200 miles, and I hoped to be able to accomplish this within the day, as I had previously sent on my luggage by mail tonga (a curious sort of two-wheeled conveyance drawn by two horses, the usual vehicle for passengers and mails between the two places), and although there are rest houses at intervals along the road where meals, etc., can be obtained, no bedding is available, and if one wishes to stop the night, it is necessary to take one's bedding with one. Bearing this in mind, I got up at about 5.30 the following (Tuesday) morning, but it was nearly eight o'clock before I started.

The road for the first fifteen miles is more or less level, but after the twenty-third mile there is a stiff climb of about 4,500 feet to Murree, which is 7,000 feet above sea level. The road on this occasion was very greasy and slippery owing to recent rain, and with sharp hairpin bends and a heavy traffic of bullock carts, troops, and camels, it was at times a difficult matter to keep the machine upright, though the actual surface of the road was not bad on the hill portion. When within two miles of Murree the road to Kashmir continues to the left, and that to Murree branches off to the right, and is a stiff gradient from about 1 in 10 to 1 in 5 right into the town. I decided to go there before proceeding on my way, firstly to get breakfast, and, secondly, because an awful thought had just struck me, namely, that the tin of petrol that I had had sent on previously had been sent to the wrong place. I had intended to have it sent to a place about 100 miles from Rawalpindi, roughly half way to Srinagar, but I then realised that I had made a stupid mistake and had had it sent to Uri, 100 miles from Murree instead of from Rawalpindi.

A Quest for Petrol.

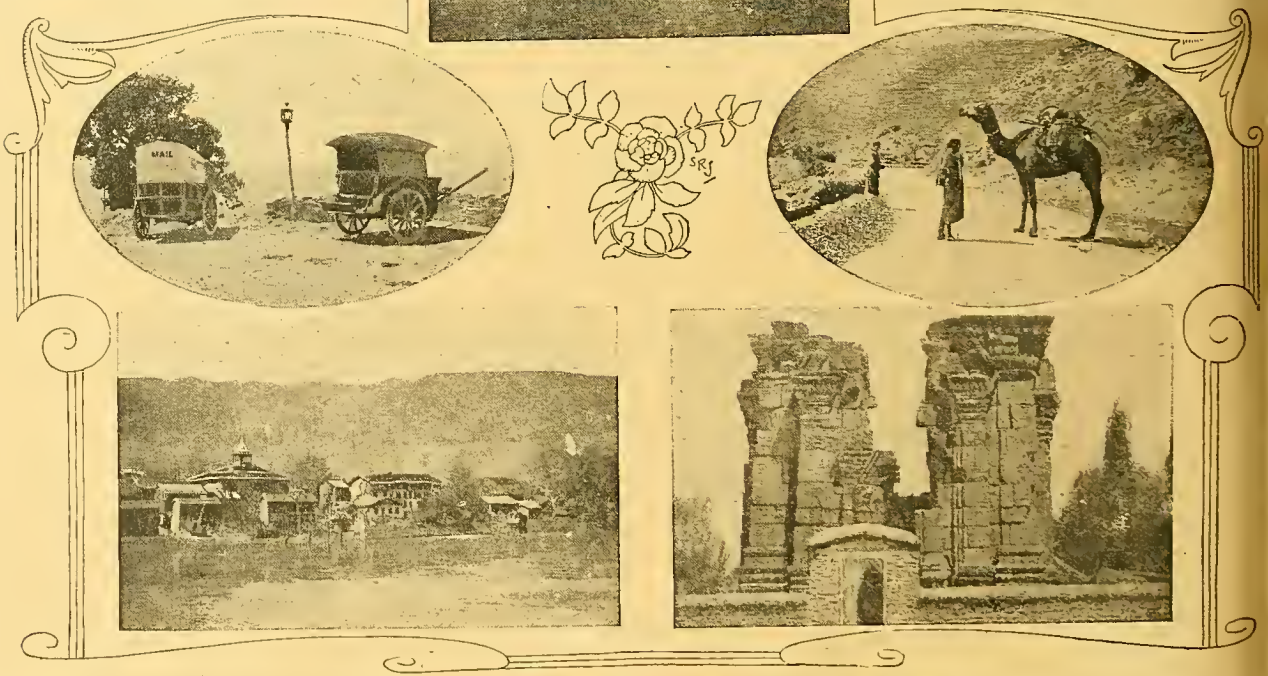
While having breakfast at a comfortable little hotel perched on the side of the hill, I made enquiries as to whether there was any possibility of my getting any petrol in the town. At first I was told that it probably could be obtained at the chemist's, and a messenger was accordingly sent off to get some, but before long he came back and said that there was none to be got either there or at any of the other shops. This was cheerful news, as my petrol was 100 miles ahead, and I only had about two-thirds of a tankful left! I thought it might be just as well to go up to the town (about half a mile above the hotel at which I was) and make quite certain that none was to be had, so with a vigorous push I got going up the gradient, which must have been about 1 in 5, rather too stiff for a free engine start, and made for the chemist's shop. After much hunting a quart bottle of the precious fluid was found—the whole available stock in Murree. I carefully poured

A Trip into Kashmir on a Motor Cycle.—

it into the tank, but was still very doubtful as to whether I should have enough to carry me the hundred miles; however, it was no good waiting any longer, and, as it was now nearly one o'clock, I made a start.

A Glorious Bit of Coasting.

In some ways the bit that now followed was perhaps the most enjoyable of the whole journey. It was one long continuous coast of 31½ miles with the exception of about a mile or two of almost level ground shortly after getting clear of Murree. In this distance one drops 4,950 feet, and it was possible to go almost the whole way with the clutch out—a most delightful experience. Shortly before reaching Kohala one can see the River Jhelum winding its way about between the mountains on either side, and it is at Kohala that one crosses the river and finds oneself in Kashmir territory. From here forward the road continues on the left-hand bank of the river, sometimes being only about fifty feet above the water, but at times 100 feet or so with an almost sheer drop down. It is an interesting bit of road, as it is cut out of the side of the precipitous bank, and, in one or two places, passes through tunnels cut in the solid rock. After I had gone some four or five miles from Kohala it began to thunder, and in a few minutes it was pouring with rain in a way that it only does in the tropics. It soon became too bad to go on, as, apart from the rain, the road was so slippery that it was almost impossible to keep the machine upright, so I took shelter in a roadmender's hut which I found a little further on until the worst was over. When it had cleared up a bit I started again, but the road was still terribly slippery, and it was only possible to proceed at about five miles an hour, and even at this pace I was continually skidding, and on one occasion found myself facing in the direction from which I had come. However I got along as best I could to Dulai, where there is a charming little dâk bungalow by the side of the river. This was named "Honeymoon Cottage" by Lady Dufferin. Here I had tea while my clothes were being dried in the sun. It had now got so late that reaching Srinagar that night was out of the question, and I decided that the best thing to do would be to stop at the dâk bungalow at Domel for the night. This I did, and it was rather an uncomfortable experience, as I had no spare clothes with me and no bedding.



(1) Reservoir near Srinagar. The mountains are always snow-capped.

(2) "Tongas," in which mails and passengers are carried in certain parts of India.

(3) On the way up to Simla.

(4) Grass-topped houses on the way to Srinagar.

(5) Ruins on the Kashmir road.

A Pleasant Evening.

The first thing I did was to have a bath. The khansamah (man in charge of the bungalow) produced some soap, but said he had no towel, so I had to dry myself with a series of dinner napkins! He lent me a most gorgeous pair of Indian shoes and also a blanket—about the latter the less said the better. There were some other European travellers staying in the bungalow on their way up to Srinagar and also the road engineer, and we had quite a cheery

A Trip into Kashmir on a Motor Cycle.—

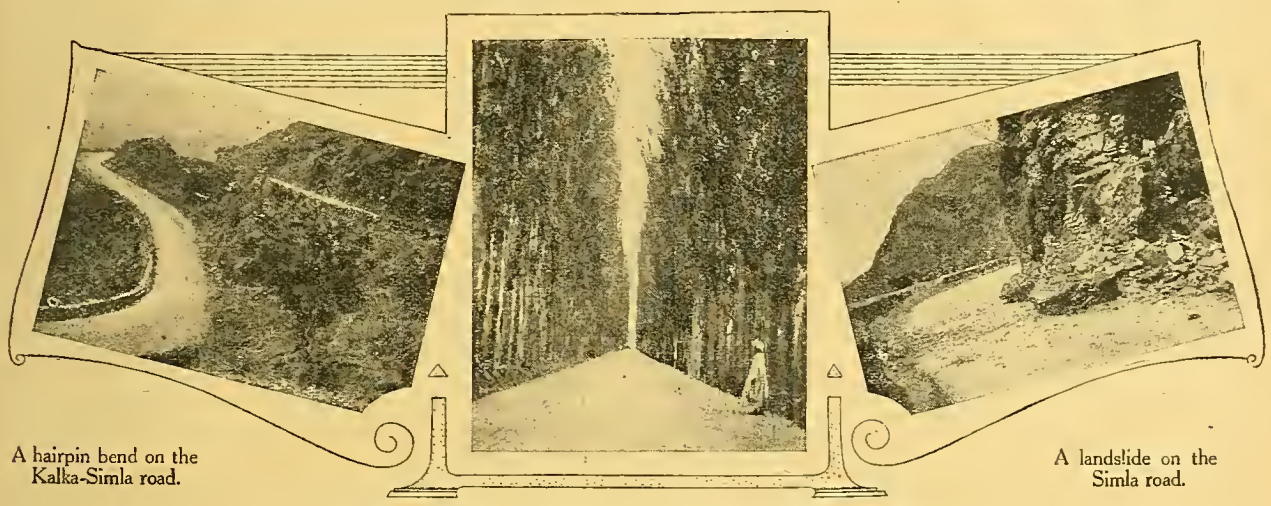
dinner on the verandah. I slept in my waistcoat and overcoat, with my waterproof overalls as a pillow. In spite of my improvised bedding, I slept soundly and awoke quite fresh and fit the next morning, and, after a bath and breakfast, I started off again, my machine having in the meantime been cleaned. But I was very doubtful whether the petrol still left in my tank would carry me on to Uri.

Getting Along by Slow Stages.

When I got to Chakoti, thirty-five miles from Domel, I looked to see how much petrol I had left and saw there was only a very little in the bottom of the tank, but, as it was only fourteen miles on to Uri, I decided to risk it, as the only alternative was to buy some kerosene oil in a bottle from the khansamah of the dâk bungalow, and I was anxious to avoid doing this if it could be avoided, owing to the difficulty of carrying it. All went well for about five miles, when the machine began to slacken and finally stopped owing to the petrol having given out! As it happened there was a horse changing stage a few yards further on, where I eventually succeeded in getting the syces (native grooms) to produce about half a bottle of very dirty kerosene oil. They were quite ready to sell me the oil, but could not be induced to part with the bottle in which they kept it, and which they apparently regarded as a most valuable possession, saying that in order to get another one they would have to go to the nearest village. I had hoped by tipping up the bicycle to use every drop of petrol and to postpone putting in the kerosene as long as possible, taking it with me in the bottle, but as this could not be managed, I had to pour the filthy stuff into the tank. The engine started quite easily and off I went, but my luck was not to last for long, as, after going two or three miles, I again came to a standstill, having used up the kerosene.

I was still some six miles from my petrol, and I started pushing and pedalling alternately, but soon got tired of this. I then espied a native rider coming towards me, and I endeavoured to induce him to let me harness his horse to my machine and tow me, but he would not agree to this, saying that his pony would jump over the precipice. However, he volunteered to go on to the next village and get coolies to push the bicycle. Meanwhile some men came along and I got them to push me into the village, some two miles away. Here at a native shop I got some more kerosene, but, as the engine was by now quite cold, I could not induce it to fire. As being pushed by coolies was a somewhat slow and monotonous procedure, I chartered an ekka (a weird sort of two-wheeled conveyance with a canopy over it drawn by a pony), fixed a long rope to it, and, taking one end in each hand, was towed the last four miles or so of the twisting mountain road into Uri, a pretty village surrounded on all sides by hills. Hurrying to the dâk bungalow, my first question to the khansamah was whether my petrol had arrived, and it is putting it mildly to say that I was glad when he answered that it had

The next stage was to Rampur, thirteen miles from Uri. The road here makes a long *détour* up the valley, and then continues along the side of some rocks. Near this point one sees the large electric works—rather a blot on this lovely country—which are worked by the concentrated energy of the Jhelum river, the water being conveyed some six miles in a large flume and falling some 400 feet. The generated current is conveyed from the power house to Srinagar, about fifty-five miles, by means of overhead wires.



A hairpin bend on the Kalka-Simla road.

A landslide on the Simla road.

View of the Avenue which, with the exception of a few breaks, extends to a distance of thirty miles into Srinagar.

An Interesting and Beautiful Road.

From Rampur to Baramulla the road is comparatively level, but by no means uninteresting on that account. About half way through this stage one gets a view of the Nanga Parbut peak, some 26,900 feet high. Apple blossom and any number of varieties of wild flowers are much in evidence, and the atmosphere is as different from the humid climate of Calcutta as chalk is from cheese.

Near Baramulla the river becomes navigable, and many people join their houseboats there and finish the thirty-five odd miles to Srinagar in them. After having had tea at a charming dâk bungalow by the side of the river, on which were to be seen many house-boats and dungas (a smaller and less elaborate type of

A Trip into Kashmir on a Motor Cycle.—

boat), I resumed my journey. It was now about 6 p.m., and I soon had to light my lamp. From here to Srinagar—34½ miles—the road runs through an almost continuous avenue of chenar and poplar trees. Being dark it was very difficult to discern anything ahead owing to the shadows cast by the trees, and I very nearly ran into a horse which had strayed into the road.

At last I reached my goal—Srinagar—at about 9.30 p.m., and although the actual distance from Rawalpindi—over 200 miles *via* Murree—is not a particularly arduous journey on an ordinary road, it is distinctly trying when one is riding continuously along the edges of precipices and turning hairpin corners.

Motor Boating at Srinagar.

Srinagar is a delightful place, and in some ways resembles Venice. The river is really part of the town and flows right through the centre of it, and in the distance are the snow-capped mountains. Many people spend several months in and around Srinagar in houseboats, shooting and fishing. Unfortunately I had no time for this, as I was only there about two and a half days. The first day was wet, and it was not possible to do more than have a look round the place. On Friday I went to the Dal Lake by motor boat, starting from my friend's house. The only difficulty we had was keeping the propeller clear of the large quantities of weed to be found in the lake. Just at the entrance to the lake from the river backwater is a bridge underneath which one passes, and on coming back one is literally shot through owing to the narrowness of the opening. In the evening I went on my motor cycle to see the Nishat and Shali Baghs—old Mahomedan gardens a few miles outside Srinagar. They are formed in terraces, and although not very bright in the way of flowers, they are well supplied with trees, and having mountains as a background, a lake in front, and clumps of lavender and lilac in between, the effect is very beautiful.

A Narrow Escape.

The next day I had to start on the return journey, and decided to take it rather more easily than I did on the way up, and so stopped the first night at Uri. As usual, there were no bed-clothes, so I had again to sleep in my overcoat, and very chilly it was in spite of a wood fire burning in the room. As a result of my scanty covering I succeeded in getting a stiff neck.

After putting into the tank the remainder of the petrol that I had left at the bungalow on the way up, I started off in the morning and very nearly annihilated a landau which I met somewhat unexpectedly round one of the numerous turns in the road. However, we just managed to escape each other without damage.

I stopped for lunch at Domel dâk bungalow, and then went on to Dulai, where I found the petrol that I had telegraphed for on the way up. Nothing of particular interest happened between here and Kohala, where I had tea at the dâk bungalow, which is situated in a most awkward position some fifty or sixty feet above the road, and reached by a steep path.

A Visit from the Police.

Leaving Kohala, I started on the long climb to Murree. The difference in temperature is very marked after one has ridden for about an hour, and by the time I got to Rowbury's hotel, over 7,000 feet above sea level, where I stayed the night, it was quite cold. Shortly after my arrival I had a visit from the inspector of police, who came to warn me for having ridden my motor bicycle within the town on my way to Kashmir and again that day. It appeared that this was against the regulations. I had an inkling that this was so on the way up, as a native constable had waved a notice at me, but, as I did not wish to walk up the hill, I thought it best not to examine the said notice too closely. After a night's rest I left Murree on the last portion of my road journey. For the first twenty-five miles it was mainly coasting and then more or less level road. The journey was completed without incident, except for a tyre bursting about three miles outside Rawalpindi. This I temporarily repaired by means of a loose bit of canvas, and this was the only tyre trouble I had throughout the trip. I carried a spare cover and two or three spare tubes with me in case of necessity.

The next morning I left Rawalpindi by the mail train at six o'clock, eventually arriving in Calcutta forty-eight hours later, after what was the most strenuous eleven and a half days' leave I have ever had. The latter part of the journey in the train was stiflingly hot—in fact, we were delayed in the middle of the day on account of a rail having buckled owing to the extreme heat.

NEWS FROM THE No. 3 BATTERY, M.M.G.S.

THE letter from A. G. C. Wheeler, of the No. 10 Battery M.M.G.S., published in our issue of July 15th, has produced another equally interesting epistle from a member of the No. 3 Battery, also on active service. The writer is Art.-Sergt. C. G. Turner, and we give extracts herewith:

"In *The Motor Cycle* of July 15th, page 59, I note reproduction of a letter from A. G. C. Wheeler, of No. 10 Battery M.M.G.S., and I think that perhaps you would care to have some news regarding the No. 3 Battery to which I belong. We have been in the firing line since March 6th, with very few rests in between, and we are still going into the trenches in sections and also as a battery. I would like to say that our machines have often gone up to within 100 yards of the fire trenches, as an inspection of the machines will show. Another way in which we have been used is in anti-aircraft work, and *very* successfully too.

"The neighbourhood we operate in is noted for its shell fire, but in several attacks in which we have been used, we have wiped out many a score, I am pleased to say. Our last trenches and the ones we are using now are not more than thirty yards from those of the enemy, and we see plenty of Huns. We are, in fact, so near that trench mortars are used, also hand bombs. Artillery certainly does dominate in this war.

"Our Daimler car drivers are real heroes. Going up to within a few hundred yards of the enemy with rations, etc., for our boys is very trying, especially at night. Bullets, shells, and gas galore, and the roads (?) a succession of shell holes."

ROAD TESTS OF NEW MODELS.

THE 4 h.p. DOUGLAS.

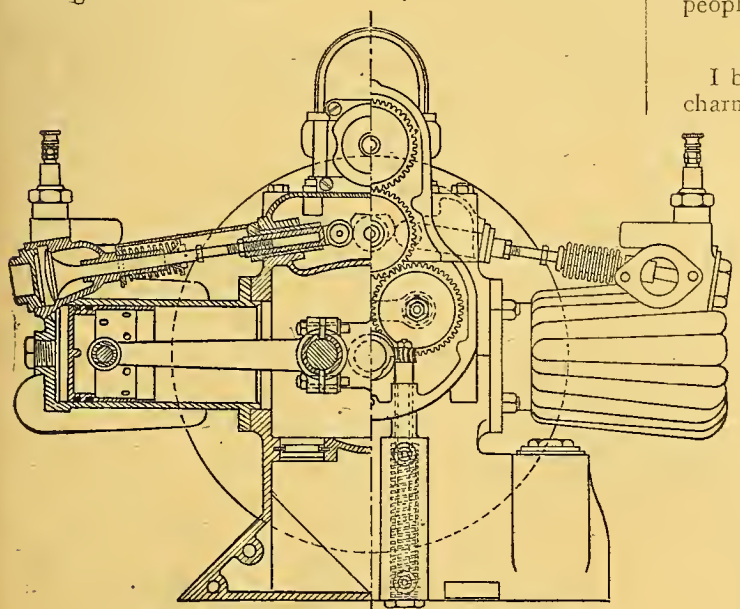
Engine 74·5 x 68 mm. bore and stroke (594 c.c.) Horizontally opposed cylinders. Three-speed gear, ratios 5¼, 8¼, and 12½ to 1. Cork insert clutch, chain and belt drive.

THE engine of the 4 h.p. Douglas must not be considered to be a copy of the better known 2¾ h.p. of the same make. There are many points of similarity, it is true—horizontally opposed cylinders, excellent balance, even firing, and outside flywheel; but there are also many points of difference—the valves are placed side by side above the cylinders and operated by a single camshaft, the stems and springs being enclosed, the silencer is low down in front of the engine instead of being underneath, and the oil is carried in a sump which is an extension of the crank case, no oil being carried in the tank, which is reserved for petrol only.

The Lubrication System.

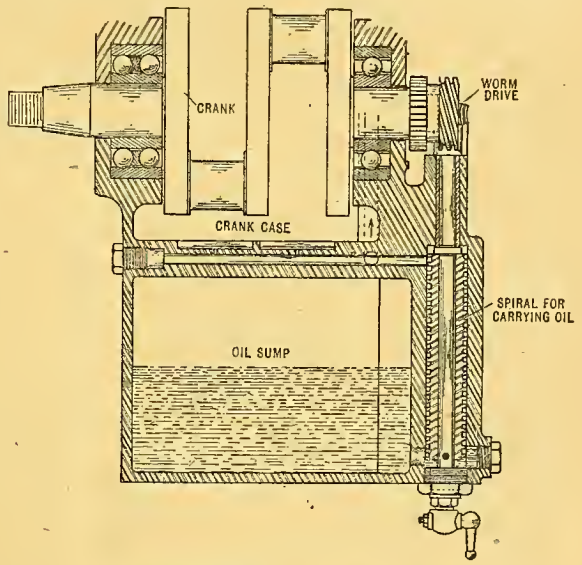
The method of lubrication to which we have just referred is very simple and effective, as well as being practically foolproof. When the oil is placed in the sump beneath the crank case the rider can dismiss the question of lubrication from his mind until he has travelled 500 miles or so, but it is better to add a little oil at more frequent intervals. Reference to the accompanying drawings will clearly show the method of working at a glance. The oil is raised from the sump by an elevator on the Archimedean screw principle to troughs into which the big ends dip. These throw the oil into the cylinders, whence channels convey it to the other bearings. The surplus drains back through a filter composed of two gauzes into the reservoir for future use. The elevator is driven by a worm on the crankshaft at one-third engine speed. That this works well in practice will be seen later.

Both crank and camshafts are carried on ball bearings, but the big end is fitted with a plain bearing.



Part sectional side elevation of the 4 h.p. Douglas engine.

The 4 h.p. Douglas sidecar outfit, selling at £77 complete, ranks as a cheap, low-powered combination in these days of three-figure 8 h.p. sets. As such, it has perhaps a better chance of ultimate survival than most, for the costlier types are bound to be hit rather hard in time by the competition of light cars in general, and particularly by the second-hand British



The Douglas lubrication. Oil sump and elevator.

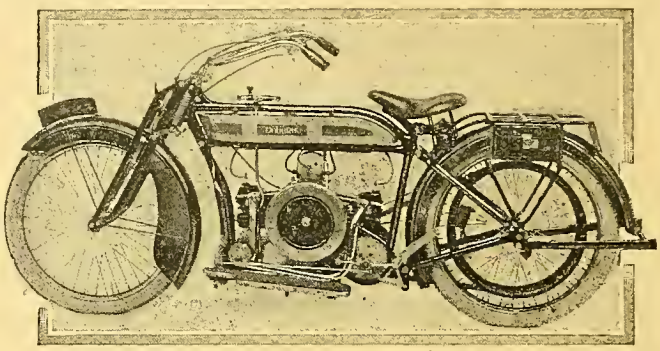
light cars and the new-imported Yankees, like the Trumbull, the Saxon, and the Scripps-Booth. Consequently the future of sidecars may depend more on the low-priced 4 h.p. combinations than many people are ready to admit.

Practical Tests by "Ixion."

I bought my machine for solo work, and have been charmed by the ease with which it responds to its kick-starter, in which respect—taking one month with another—it easily excels any single-cylinder I have owned. The clutch is exceedingly sweet, and the normal speed of the engine on the top ratio of 5¼ (sidecar gear) is 35 m.p.h.; express train speeds are possible on full throttle, and the engine will turn over smoothly in traffic on the merest whiff of gas. The indirect gears are unusually silent, and on the bottom gear of 12½ anything can be climbed. Acceleration is quite a unique feature: the engine is much better silenced than the 2¾ h.p. of the same make, whilst retaining all its balance—in fact, I think its balance is better, and, excluding very low rates of revolution, for which I have not yet tuned it up to my satisfaction, the running is more reminiscent of a steam turbine than any motor cycle engine I have yet handled. Increasing wind pressure on the cheeks is the

Road Tests of New Models.

most pronounced sensation as the throttle is opened. The lubrication arrangement is very satisfactory, in that distances up to 500 miles can be covered on a single filling of the crank case sump, and the circulation is such that there is no doubt about every bush getting its supply; in fact, the pressure is so good that a little oil escapes from some joint of my crank case, and I have yet to trace the point. The only defect in design seems to be that the carburetter protrudes rather inconveniently on the right side of the machine, and one has to execute a distinct flanking movement with the calf to get at the brake pedal; but this handicap is common to most horizontal twins of large capacity, and at present can only be countered by setting the brake pedal further out than most designers consider wise.



Flywheel side of the 1915 model 4 h.p. Douglas, the road experiences with which are described in the accompanying article.

I was so smitten with the paces of the machine that I went out of my way to test it with a sidecar, though, somehow or other, I have never been an enthusiastic sidecarist. After driving a sidecar-burdened "choggy" single-cylinder, the horizontal twin is a revelation. The engine seems to ignore the extra load, and is very perceptibly faster and smoother at its work than any single of similar capacity can hope to be. One is not perpetually trying to avoid a knock, or to get the engine to pick up; it is literally made for the job, and thinks nothing of plugging away for mile after mile when occasion requires.

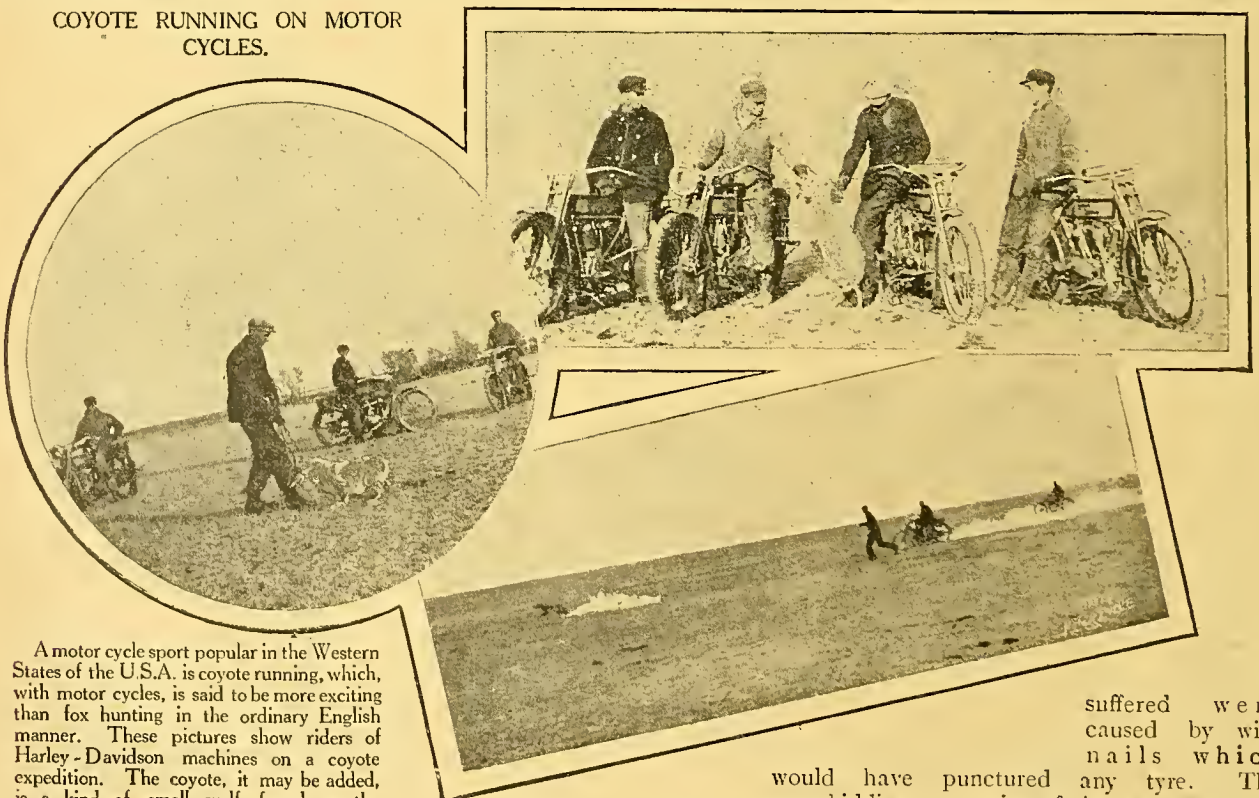
IXION.

A GOOD TYRE COVER.

FOR some little time I have been testing a John Bull Rib-Stud motor cycle tyre. This tyre began its work on the rear wheel of a chain-driven 3 h.p. machine. At the end of 2,730 miles it was removed to the front wheel, not because it was incapable of further work on the driving wheel, but because I wished to make a trial of another cover in the rear position. The total mileage is now 5,700, and careful measurement of the rib-studs shows the thickness to be approximately $\frac{1}{16}$in. in centre and $\frac{1}{8}$in. at the sides, the original depth of the studs being $\frac{5}{32}$in., and the thickness of the rubber below the studs about the same. The cover is 2$\frac{3}{8}$in. in section, and has given no trouble. The two punctures suffered were caused by wire nails which would have punctured any tyre. The non-skidding properties of the tyre are excellent.

AURIGA.

COYOTE RUNNING ON MOTOR CYCLES.

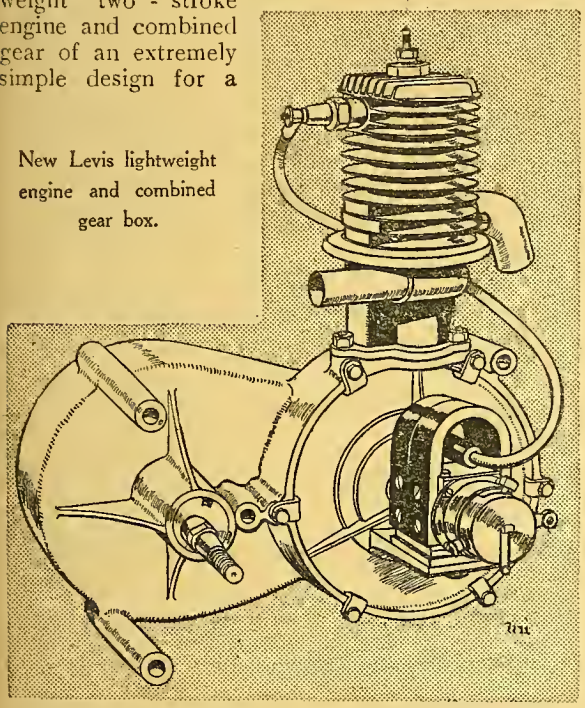


A motor cycle sport popular in the Western States of the U.S.A. is coyote running, which, with motor cycles, is said to be more exciting than fox hunting in the ordinary English manner. These pictures show riders of Harley-Davidson machines on a coyote expedition. The coyote, it may be added, is a kind of small wolf found on the Western prairies of North America.

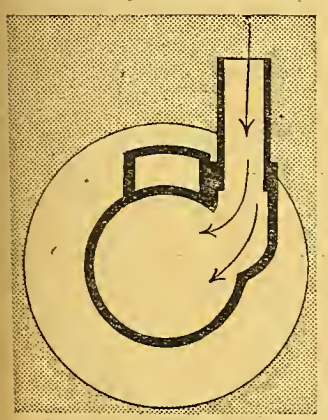
Simplicity in Motor Cycle Design.

A Two-stroke Two-speed Power Unit for a 1916 Model.

THE two-stroke engine, with its absence of valves and valve gear, offers great opportunities to designers of producing extraordinarily simple power units, and not a few have shown themselves capable of grasping such opportunities. In this connection it is interesting to note that Messrs. Butterfields, Ltd., are producing a newly-designed lightweight two-stroke engine and combined gear of an extremely simple design for a new Levis lightweight machine, which is to be placed upon the market at a future date. Several patents have been taken out in reference to this new power unit, and many of the features are of a highly novel character. The cylinder is of the three-port type, with a bore of 60 mm., and a stroke of 70 mm., the nominal horse-power being approximately 2-3, and the cubical capacity 198 c.c. The cylinder is bolted to a very narrow crank case, housing a plain single flywheel which takes the place of the ordinary type crankshaft by having a pin attached to its outer face carrying the connecting rod big end. Both the spindle carrying the flywheel and the connecting rod big end are fitted with Hoffmann roller bearings, and from inspection of a specimen engine at the Levis works we were agreeably impressed by the first-class workmanship put into these parts of the engine. The two-speed gear and clutch incorporated in this unit is the Enfield twin clutch and chain type, and it is carried in a casing cast in one with the crank case, means being provided to allow of the complete gear and chains being adjusted or withdrawn from the casing by simply removing a few screws and a cover plate. The clutch spindle is, as usual, held in an eccentric mounting in order to provide adjustment for the chains. The gear ratios employed are 5¾ and 9½ to 1, and both gears are, of course, direct.



New Levis lightweight engine and combined gear box.

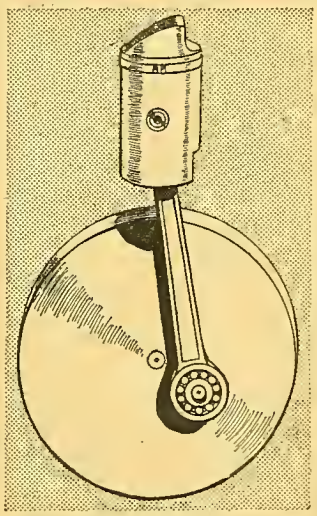


Sectional diagram of cylinder showing streamline entry port.

One of the patents relating to the new Levis engine concerns the simple and direct method of mounting the magneto on a small platform at the side of the engine, and driving it by means of a small dog lever connected to the crank pin inside the crank case. This eliminates the chain and sprocket drive necessary with the usual form of magneto drive on two-stroke engines, whilst the magneto itself is in an infinitely more accessible position and can be more easily removed when required.

The Lubrication System.

The cylinder itself has several interesting features, the chief of which is the new streamline entry port cast with the cylinder and leading from the carburetter. By this arrangement the mixture enters the crank case at a considerably higher speed than with the ordinary type port, thus increasing the general efficiency of the engine. The lubrication of the cylinder is effected by oil being led to an annular chamber which leads the oil to the piston *via* a series of small holes drilled in the cylinder wall, whilst any excess oil is prevented from being thrown into the cylinder from the crank case by base plates as in the ordinary four-stroke type of motor cycle engine. With this arrangement one should therefore have very little trouble from excess lubrication. The piston is a very light and neat piece of work, and only one ring is fitted.



Piston, connecting rod and flywheel of the Levis lightweight engine. Roller bearings are fitted to the big end of the connecting rod.

We should imagine that this engine should do very well in a lightweight machine, as the internal friction of the power unit has been reduced to a minimum, consistent with good wearing qualities, and although of only 198 c.c., the engine should have no difficulty in taking a rider of average size and weight over almost every road and hill in this country with the assistance of the efficient two-speed gear incorporated in the power unit.

"THE MOTOR CYCLE" RECRUITING SECTION.

A fine batch of men recruited last week by the Editor of *The Motor Cycle* for the M.M.G.S.—enough for a complete battery.

LAST week's list of enlistments of motor cyclists and car drivers in Coventry for the Motor Machine Gun Service are given hereunder:

Avison, Arthur D., Rainhill
Britcliffe, C. H., Mansfield
Bower, Harold, Huddersfield
Beckett, J. E., Rochdale
Baker, E. W. C., King's Lynn
Black, A., Sunderland
Bradshaw, W., Manchester (A.S.C.)
Clarke, P. O., Colchester
Dent, J., Ulverston
Darling, W. J., Catford, S.E.
Fuggle, W. H., Slough
Gore, W., Manchester
Hatcher, A. S., Ipswich
Harrison, F., Sheffield
Hall, S., Beckenham, S.E.
Hingeley, C. R., Stourbridge
Hartley, W., Sunderland
Johns, J. E., Devonport
Johnson, A. W., London, S.W.
Lewis, T. A., Aberaman
Langworthy, H. R., Plymouth
Lyon, W. I., London, S.E. (A.S.C.)
Mehew, O. G., Huntingdon
McKenzie, V., Haverfordwest
Merrett, T., Winchfield
Mongiardino, L., London (A.S.C.)
Moffatt, R., Harrogate
Morgan, L. H., Market Harborough (A.S.C.)
Mellor, Norman, Huddersfield
May, W. E. Southcomb, London
McKenzie, C., Coventry
Nelson, E. R., Grimsby
North, P. E., Loughborough
Peel, J. A., London, W.
Phillips, T., Cardiff
Price, T. J. E., Stourbridge
Peacock, W. B. (A.S.C.)
Rawden, T., Grimsby
Rawling, T. J., Cleator
Reynolds, F. J. B., Coventry
Richards, H. (A.S.C.)
Rainbow, J., Letchworth
Simpson, P., Hammersmith, W.
Smith, J. S., Eltham
Scruton, S., Middlesbrough
Stubbs, W., New Balderton
Spalding, A. (A.S.C.)
Taylor, H., Brighouse
Tarry, A. J. W., Northampton
Townley, D., Ashton-under-Lyne
Vitali, J. C., Manchester (A.S.C.)
Walton, A. S., London, S.W.
Woodland, A., Liverpool
Wood, H. M., Bridlington (A.S.C.)
Weight, F. A., Newport, Mon.

The men were examined on Wednesday afternoon, were sworn in, and received their day's pay, billeted out in Coventry that evening, and marched down to the station on Thursday morning.

The number of applications received continues to be most satisfactory. Only a small percentage of the pedal cyclists who apply for admission have been accepted. Men of good physique who have either had previous military training or engineering experience are the type usually selected.

Among the list of recruits will be noticed the name of Mr. Southcomb May, hon. sec. of the Motor Cycling Club (London), who queried us as to a M.C.C. member who might like to take up his secretarial duties.

L. Mongiardino is the third or fourth Britisher who has come over from South America specially to enlist.

A solicitor who attended the inspection, though qualified for a position as car driver at 6s. per day, preferred the motor cyclist's work at 1s. 2½d.—a sporting decision which greatly pleased the other recruits.

One or two despatch riders were examined and passed for the Royal Engineers' waiting list last week.

Still more men are wanted for the new batteries. The form below should be filled in and forwarded to Mr. Geoffrey Smith, Editor, *The Motor Cycle*, Coventry, when a free railway warrant to attend an inspection at the Recruiting Office, Coventry, on Wednesday afternoon next, will be issued to suitable candidates.

A few experienced motor cycle workshop mechanics are wanted. These are A.S.C. men attached to the M.M.G.S.

HARLEY-DAVIDSON

We have actually in Stock for IMMEDIATE DELIVERY every model—prices from £52 to £76 13s. Also special "GLORIA" and "CANOELET" Sidecars, painted and enamelled H-D Grey, with 28in. x 3in. tyres. We can make a good allowance for your present machine, or arrange payment by instalments.

SOLE DISTRIBUTORS
(Wholesale and Retail) for the Counties of Warwickshire, Worcestershire, Staffordshire, Shropshire, and Herefordshire:

THE PREMIER MOTOR COMPANY,

ASTON ROAD, BIRMINGHAM.

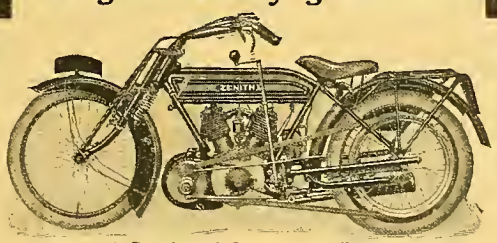
THE

ZENITH

WITH THE GRADUA GEAR

de-grades any gradient.

An intelligent use of the Gradua gear enables ZENITH riders to climb any hill faster than with any other gear. Take the above example: the Gradua Gear is lowered a step at a time till A is reached, when it can at once be raised until before B is reached the machine is travelling as fast as if no hill were there. Hills melt away from the ZENITH.



A "Clutch and Countershaft" type.

Model W., 3½ h.p., 85½ x 85 mm. single-cylinder, has been introduced at the request of H.M. War Office, to which a large number has been supplied. We can execute orders for a limited number of private users.

Let us send you our Catalogue, fully detailing these models.

STANDARD.
TWIN-CYLINDER.

A. 3½ h.p. 70 x 64½ mm.
C. 4-5 h.p. 70 x 85 mm.
E. 6 h.p. 76 x 85 mm.
G. 8 h.p. 85½ x 85 mm.

COUNTERSHAFT.

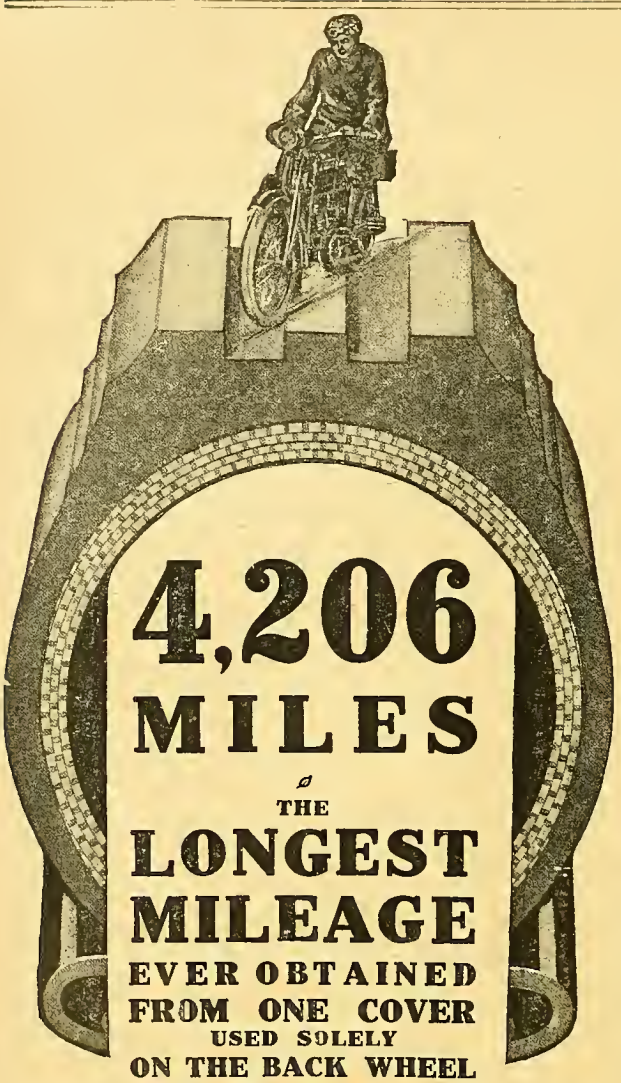
ZENITH MOTORS, LIMITED, HAMPTON COURT, ENGLAND.



4,206 MILES

THE

LONGEST MILEAGE

EVER OBTAINED FROM ONE COVER USED SOLELY ON THE BACK WHEEL

This result was obtained with a Pedley Tyre by "Magnet" on a big Clyno Sidecar Outfit, who gave his experiences with different makes of Tyres in *Motor Cycling* of May 18th.

Several makes were tested, and Pedley gave the best results and greatest mileage.

Another Pedley Tyre tested by "Magnet" gave 4,762 miles (3,792 back, 970 front) and still running.

These two instances prove once again that the Pedley is the tyre of Highest Quality, Greatest Reliability, Biggest Mileage.

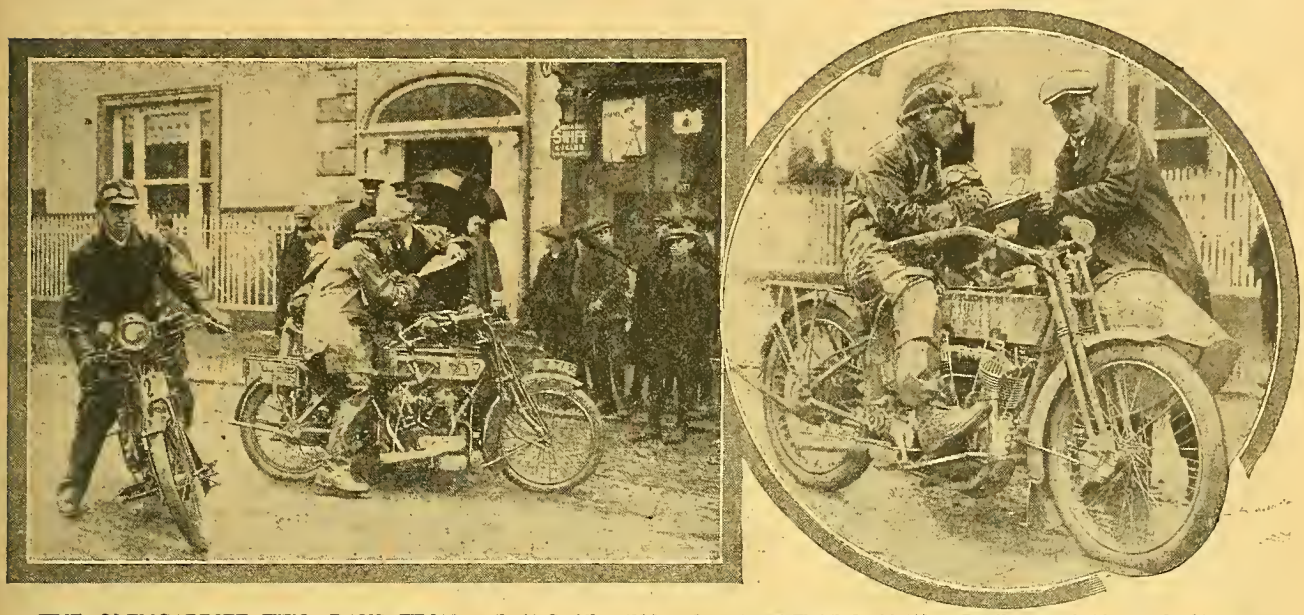
Open Two Days Trial in Ireland.

Weather Interferes with the Pleasure of the Glengarriff and Back Run.



THE GLENGARRIFF TWO DAYS TRIAL. (Left) S. Allen (3½ h.p. James) and T. W. Ladd (6 h.p. Bradbury and sidecar) checking in. (Right) W. J. Henderson (Harley-Davidson) signing the sheet at Cashel.

THE open two days trial of the Dublin and District Motor Cycle Club was held on Saturday and Monday last. As usual, the event was to Glengarriff and back, and as the off day enabled the competitors to spend a very pleasant time amid the delightful surroundings of that favoured spot, the entry was very fair.

The conditions were of the customary character, but the fact that there were no secret checks, save in the first sixteen miles on the first day and the last sixteen miles on the second, made the event of a holiday nature. The allowance of grace at the secret controls was two minutes either side of schedule time, a similar allowance being made at all the open controls and an extra eight minutes at Limerick on the second day. Although the distances were long—225 miles on the first day and 222 on the second—the route was a relatively easy one. Such hills as were likely to cause trouble were covered by the non-stop sections, these including the crossing of the Knockmealdown mountains in Tipperary from Clogheen to Lismore, and the ascent of the Pass of Keimaneigh from the Inchigeela side on the first day and Gowlane Hill, outside Kenmare, on Monday. None of these hills are of the impossible class, Gowlane being the severest, but as it has been ascended by a high-powered single on top gear it will be seen it has little terrors for the modern variably-geared machine.

The competitors were sent away from Inchicore Bridge at one-minute intervals from six o'clock on Saturday morning.

Two secret checks were taken before Naas was reached, and with these disturbing influences out of the way there was nothing but the weather to interfere with the pleasure of the southern journey, and that it did to a considerable extent. The route lay along the main road to Cork by Newbridge, Kildare, Monasterevan, Maryborough, and Abbeyleix, to Cashel, where an interval of an hour gave an opportunity for a second breakfast while the machines were in control at Harringan's. Three of the thirty-five starters were missing at Cashel, Culhane (Crouch cycle car), Grimes (5 h.p. Indian), and J. J. White (2¼ h.p. Sun) having retired, the first-named as a result of a sideslip. All were on time, with the exception of Summerfield, who was twenty-five minutes late owing to tyre and plug troubles.

The journey was resumed by the first of the competitors at 11.40, and, continuing on the Cork road to Clogheen, the riders turned into the mountains to cross to Lismore by the Gap. The long ascent did not give any trouble, but the sharp hairpin corner half way up the hill was faced with a certain amount of trepidation. The rain continued to descend in a most persistent manner, and the wind was so fierce on the descent that the downward run to Lismore was as hard as the ascent from Clogheen. Freeman (7-9 h.p. Indian) was compelled to drop out near Fermoy owing to his speedometer getting mixed up with his front wheel, but he went on after repairing, and returned to Dublin on Monday with the competitors.

The check at Cork found another five missing. Sullivan (5 h.p. Indian) retired with a waterlogged magneto. Kelly (6 h.p. New Hudson sc.) and O'Flaherty had tyre troubles. Wallen (6 h.p. A.J.S. sc.) had to put right an air lock, but he, as well as Freeman, went on to Glengarriff for the week-end, although officially out.

A fine road out to Macroom and Inchingeela left the engines in nice tune for the ascent of the Pass of Keimaneigh.

The Return Journey.

There were twenty-seven eligible to start on Monday morning out of the thirty-five who left Dublin, but Day (2¼ h.p. Sun), having met with a slight accident on Sunday, did not continue, and Cruise (6 h.p. A.J.S. sc.), who was very late in arriving at Glengarriff on Saturday, also retired. The return journey was by Limerick. Leaving Glengarriff by the Tunnel road in better weather than was experienced on Saturday, Gowlane was tackled before Kenmare was awake. Many of the machines had evidently suffered from the effects of the soaking rain they got on Saturday, as a number of those who up to this had clean records were compelled to acknowledge stops.

The weather continued good for the forenoon run to the luncheon control at Limerick, but frequent and heavy showers were experienced in the afternoon run of 120 miles to Dublin. A couple of secret checks were taken between Naas and Dublin, but even without these there should be little difficulty in finding a winner of the competition. Twenty-one of the twenty-five men started from Glengarriff and completed the second day's journey, Chambers, Summerfield, Walshe, and Doolin retiring on the way. There were ten failures to make clean ascents of Gowlane Hill. The finishers were :

Roche (Rover)
Curtis (Indian sc.)

Soldier Motor Cyclists.

We recently met two officers who are well-known motor cyclists. Of these, one was Second-Lieutenant C. S. Burney, who is looking the picture of health, and is driving a Singer light car. His brother, Alec. Burney, is still serving in France. The other was Vernon Busby, whom we congratulated on getting his second star. He is shortly to be transferred from the R.E. to the R.F.C.

The Importance of Rear Springing.

As our readers know, we devoted quite a lot of space in our last issue to the question of rear springing on motor cycles, and it was an interesting coincidence that our contemporary *The Scottish Motor Cyclist* in its same issue had a paragraph on the subject, which also formed the title for its poster, as it did for *The Motor Cycle*.

Damages for a Motor Cyclist.

It is not often that an individual, especially a motorist, succeeds in a claim against a corporation. Therefore, we congratulate Mr. M. Kinrade upon his success in claiming damages from the Barrow Corporation. Mr. Kinrade, who has but one arm, was thrown from his machine by a badly filled up trench, and his shoulder dislocated. After some litigation the case was settled out of court, the damages being agreed upon at £75.

Motor Cycle Registrations in London.

The number of motor cycles registered in the area of the London County Council during the quarter ended June 30th last was 2,556, making a total of 39,916 since registration began. Registrations of changes of ownership of motor cycles numbered 1,223, bringing the total of such registrations to 19,353.

Second-hand Prices.

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*, and also the average prices for the last eight weeks. The prices quoted way be regarded as their standard value.

Make.	Year.	H.P.		Last week's average	Average for past 8 weeks.
A.J.S.	1914	6	3-sp. sidecar ..	£79	£74
Bat	1913	6	2-sp. sidecar ..	£51	£51
Bradbury ..	1914	4	2-speed	£37	£43

HOLIDAY EVENTS.

SIMPLICITY IN MOTOR CYCLE DESIGN

A TRIP INTO KASHMIR ON A MOTOR CYCLE.

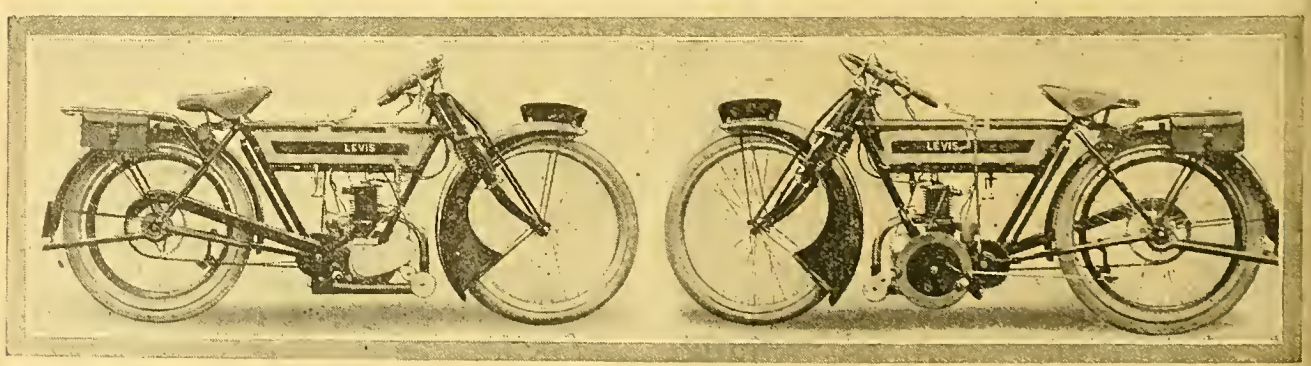
Big Second-hand Prices.

It is common knowledge that the second-hand market is in an abnormal condition owing to difficulty in getting quick deliveries of new machines. Second-hand machines are consequently fetching high prices, and as an instance of this we know of a 6 h.p. 1915 A.J.S. sidecar outfit which fetched £105 after having done 2,500 miles. Beyond wear on tyres it was as new, and it was most luxuriously equipped; nevertheless it is a good price.

What No. 7 Battery M.M.G.S. is doing.

From a letter received from Sergt.-Art. S. Towler, of the No. 7 Battery, it appears that this battery has now had a turn in the trenches. When he wrote two sections were in the trenches, the other resting behind the lines. The whole battery has been under fire at one time or another, and the machines have been taken right up to within half a mile of the front line trenches. So far the casualties have been light—only two men wounded.

The No. 7 is equipped with Clynos, which Sergt. Towler says are standing up well—likewise the Rom tyres. At the time of writing not one of the eighteen machines had suffered from a puncture—perhaps the detachable wheels have some mysterious effect upon the puncture fiend.



A 1915½ PATTERN LEVIS.

A new Levis two-stroke lightweight, which has been submitted to one of the Allied Governments. The 2½ h.p. engine measures 73 × 70 mm. and an Enfield two-speed gear, with all chain drive, is embodied. This model is really the forerunner of a new series of Levis lightweights.

At the Front.

Lieut. Philip Grout, who has been acting as secretary of the Motor Cyclists' Reserve Committee in the South Midland Divisional Area, left a few days ago for Overseas with a field company. Lieut. Grout has handled probably more despatch riders for the Royal Engineers than any other single man, and has now elected to take up "active" service for

Lieut. Philip Grout.

his country. As late secretary and founder of the Bristol Motor Cycle Club, Lieut. Grout organised one of the most successful trials held in England, viz., the Bristol one day event in April, 1913. As a result he was appointed chief marshal at the Tourist Trophy Races of 1913. Grout is one of the old brigade, and won a silver cup for the best lightweight performance in the Land's End to John-o'-Groat's trial of 1910. All his motor cyclist friends will wish him luck.

Sidecars Wanted for Wounded Soldiers.

Mr. H. Milligan, 45, Terminus Road, Eastbourne, is anxious to hear of a dozen motor cyclists who will communicate with him with a view to giving some wounded soldiers an afternoon's outing one Sunday in the near future.

A Regrettable Accident.

We learn that, while bound for a week-end tour in Wales on their new double-seated sidecar outfit, Mr. and Mrs. Harry Stevens, of A.J.S. fame, met with a serious accident last Saturday. It was caused by a collision with a large closed car at the junction of the London, Liverpool, and Holyhead roads, near Ivertsey Bank. Unfortunately, both Mr. and Mrs. Stevens were badly cut about the head and face, while it is feared that Mr. Stevens is also suffering from a broken arm. The car was turned over, and the occupants all required the attention of the doctor while the car and sidecar suffered extensive damage.

Luckily Mr. W. H. Carson, of Coventry, who was journeying to Carnarvon on his Excelsior sidecar, almost immediately arrived upon the scene, and at once hurried on to Shifnal for a doctor. Eventually Mr. and Mrs. Stevens were taken back to Wolverhampton on their brother's car. We wish all who were injured a speedy recovery.

Retracing Lost Friends.

In our recruiting section last week we mentioned the case of F. S. Roberts, who came all the way from Sydney, N.S.W., to enlist in the M.M.G.S. An old friend, living in Edinburgh, who had not seen or heard of Roberts for some considerable time, saw the paragraph, and wrote asking to be put into touch with him, and we immediately complied.

A Competitor in the All-khaki Race Meeting.

C. Allison, late of the Scott Co. and Colmore Depot, Birmingham, has entered for the All-khaki race meeting at Brooklands next Saturday. Allison has been at the Front with the No. 1 Motor Machine Gun Battery, and was invalided home on May 5th.

The All-khaki Races at Brooklands.

Provided the weather is kind, Brooklands will next Saturday be as bright as in the days before the war. There may not be so many spectators, but with a total of 172 entries for the eleven events, there will be good sport and plenty to see. The complete entry list appears on page 136.

Motor Cyclists' Holiday Haunts.

The Peak District as usual attracted many motor cyclists during the holiday time. On Bank Holiday, the garages in Buxton and Matlock were very full, indeed overflowing when the rain came down, which it did at intervals in real earnest. The oolite road surface of the Peak is particularly slippery in the wet, and we noticed with some concern passengers on the carriers of motor cycles, but we witnessed no sideslip. The number of khaki-clad motor cyclists on the road was extraordinary.

Presents for Motor Cyclist Soldiers.

In connection with the smoking concert organised some little time ago among the different Birmingham and district motor cycle clubs, we hear from Mr. S. K. Jones that presents have found their way to a hundred members who are serving their King and Country, and of the dozen or so presents still outstanding, one is now to be despatched to Corporal Brown,

A remarkable two-wheeled motor vehicle, known as the Gibson Mon-Auto, and built in the U.S.A. It is driven by a single-cylinder engine, 66.7 mm. × 76 mm., and it is geared to the rear wheel at a reduction of 5 to 1. Diameter of the wheels is 14in., the complete machine weighs 45 lb., and it is to sell at about £20.

the letter in our last issue having led Mr. Jones to apply to us for Corporal Brown's address. Mrs. Clarke, mother of Corporal Kenneth Clarke, a despatch rider who lost his life some months ago, has received £15 of the amount contributed.

Death of Mr. C. W. Hathaway.

It is with sincere regret that we have to record the death of Mr. C. W.

The late Mr. C. W. Hathaway, for twenty-five years works manager of the Triumph Cycle Co., Ltd, Coventry.

Hathaway, works manager of the Triumph Cycle Co., Ltd. Mr. Hathaway, though comparatively unknown to the outside world, had a great deal to do with the joys of thousands of motor cyclists, for he it was who was responsible for the Triumph motor cycle since the earliest days, and everyone knows how the evolution of the motor cycle has very largely followed Triumph standards. Mr. C. W. Hathaway, as a member of the Coventry Munitions Committee, was received by H.M. the King on Thursday, the 22nd ult., when he seemed fit and well, but that same evening Mr. Hathaway was taken ill at a friend's house, and though an operation was performed the next day he passed away on Wednesday morning last week. Mr. Hathaway's abilities as an engineer and organiser were greatly valued by his directors, Messrs. S. Bettmann and M. J. Schulte, with whom he came from London in the earliest days of the Triumph Co. For twenty-five years Mr. Hathaway has acted as works manager to the company in question, and it does not seem long ago that we attended a dinner at which he was the recipient of a handsome presentation from his men (with whom he was immensely popular) on the occasion of his completing twenty-one years' service with the company. He was 51 years of age, and leaves a widow and five children, one son being in the No. 5 Motor Machine Gun Battery. The funeral took place at the Coventry Cemetery on Saturday morning last, and among the many handsome wreaths was one from the Coventry and Warwickshire Motor Club, of which body he was a member for many years.

READY TO GO ANYWHERE

AND TO DO ANYTHING!

THE views on this page show over a hundred motor cyclist despatch riders attached to the R.E. Signal Section, being inspected by Sir Edward Every and Lieut. Howe, and served out with equipment previous to leaving for the Front. It is, we believe, the largest batch of despatch riders which has ever left England in one instalment. The machines, it will be noticed, are Triumphs and Douglases, these being the two makes at present used by the authorities for despatch riding overseas Equipment of both men and mounts is most complete. The photographs, which were taken at a well-known training centre for those who enlist for the Signal Services, of which despatch riders form a very large part, will bring home to everyone the extent to which motor cycles are used, and emphasise the important part they play in the great War. A number of these men enlisted through the recruiting section of "The Motor Cycle," and our readers will join us in wishing them all the best of fortune.

172 Entries for the All-khaki Race Meeting.

Promise of Good Sport at Brooklands next Saturday. General Public to be Admitted.

NEXT Saturday Brooklands will be the scene of one of the most interesting race meetings which has ever been held. It will indeed be a novelty, and one of which a short time ago we would never have ever even dreamed to see a series of sporting motor cycle races in which each competitor wears the King's uniform. No mischievous critics can find fault with racing under these conditions, as no slackers will take part. The stewards will be staff officers, and the majority of the officials will be in khaki. The entries have been quite good considering the uncertainty under which the British soldier is living at the present time, and it is to be expected that the number of spectators will be considerable.

Silver cup to be presented by *The Motor Cycle* to the competitor making the best aggregate performance at the All-khaki race meeting at Brooklands on Saturday next.

The first race will start at 2 p.m. Members of the Brooklands Automobile and the British Motor Cycle Racing Clubs will be admitted free if they are wearing their badges, whilst the general public will be admitted on payment of 1s. Tea and light refreshments can be obtained on the track.

The following is a list of the entries received by last Monday; further entries were received on Tuesday, and the number of these is given also:

EVENT 1.—LIGHTWEIGHT HALF-MILE SPRINT.
2nd Lieut. E. H. Dimmock (9th Loyal N. Lancs), Connaught, 270 c.c.

EVENT 2.—"DOUGLAS" HALF-MILE SPRINT.
Capt. G. L. Andrew (Army Cyclist Corps), Douglas, 350 c.c.
Also four others.

EVENT 3.—MEDIUM-WEIGHT HALF-MILE SPRINT FOR TOURING MOTOR CYCLES.
2nd Lieut. V. Spencer Daniell (8th The Buffs), James, 500 c.c.
Lieut. J. H. C. Lindesay (25th Div. Cyclist Company), Rudge-Multi, 499 c.c.
Private Ed. R. Mecredy (52nd Company, A.S.C., M.T.), Arno, 493 c.c.
Capt. J. H. Storey (9th S. Lancs), Rudge-Multi, 500 c.c.
Lieut. H. W. Tait (D.L.I.)
Lance-Corpl. H. R. Whitmore (Royal Engineers), Lea-Francis, 496 c.c.
2nd Lieut. B. H. Ryder (R.F.A.), Triumph, 499 c.c.
2nd Lieut. W. C. Hull (Royal West Kent), Ivy-Precision.
Also thirteen others.

EVENT 4.—MEDIUM-WEIGHT HALF-MILE SPRINT FOR RACING MOTOR CYCLES.
Capt. G. L. Andrew (Army Cyclist Corps), Douglas, 350 c.c.
Lance-Corpl. Frank Collard (13th Cheshires), Trusty-Precision, 500 c.c.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
Lieut. A. Lindsay (R.A.M.C.), Norton, 490 c.c.
2nd Lieut. C. E. Medhurst (Royal Flying Corps), Norton, 490 c.c.
Private G. W. Miller (52nd Company, A.S.C., M.T.), Blackburne, 499 c.c.
2nd Lieut. B. H. Ryder (R.F.A.), Triumph, 499 c.c.
Lieut. H. W. Tait (D.L.I.)
Lieut. G. H. Walker (25th Div. Cyclist Company), Royal Enfield, 425 c.c.
Lance-Corpl. H. R. Whitmore (Royal Engineers), Lea-Francis, 496 c.c.
Private E. G. House (273 Company, A.S.C., M.T.), Rudge-Multi, 499 c.c.
Also thirteen others.

EVENT 5.—QUICK-CHANGE PLUG RACE.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
Private A. C. S. Irwin (M.C.O.T.C.), New Imperial, 293 c.c.
Lieut. A. Lindsay (R.A.M.C.), Norton, 490 c.c.
Asst. Paymaster C. P. Marcel (R.N.R.), Indian, 994 c.c.
2nd Lieut. B. H. Ryder (R.F.A.), Triumph, 499 c.c.
Lieut. G. H. Walker (25th Div. Cyclist Company), Royal Enfield, 425 c.c.
Lance-Corpl. H. R. Whitmore (Royal Engineers), Lea-Francis, 496 c.c.
Corpl. F. E. Barker (M.T., A.S.C., Motor Cyclist Section), Zenith.
Also twelve others.

EVENT 6.—UNLIMITED HALF-MILE SPRINT.
Capt. E. W. S. Bardsley (King's Own), Indian, 994 c.c.
Lieut. R. Escombe (R.F.A.), Indian, 994 c.c.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
2nd Lieut. E. W. Hardman (Loyal N. Lancs), Indian.
2nd Lieut. N. T. Herbert (Royal Warwickshires), Zenith.
Lieut. A. Lindsay (R.A.M.C.), Norton, 490 c.c.
Asst. Paymaster C. P. Marcel (R.N.R.), Indian, 994 c.c.
Lieut. G. H. Walker (25th Div. Cyclist Company), Royal Enfield, 425 c.c.
Lieut. R. C. Wright (Royal Warwickshires), Bat.
Private R. H. Waddy (Oundle O.T.C.), Indian, 994 c.c.
Corpl. F. E. Barker (M.T., A.S.C., Motor Cyclist Section), Zenith.
Also ten others.

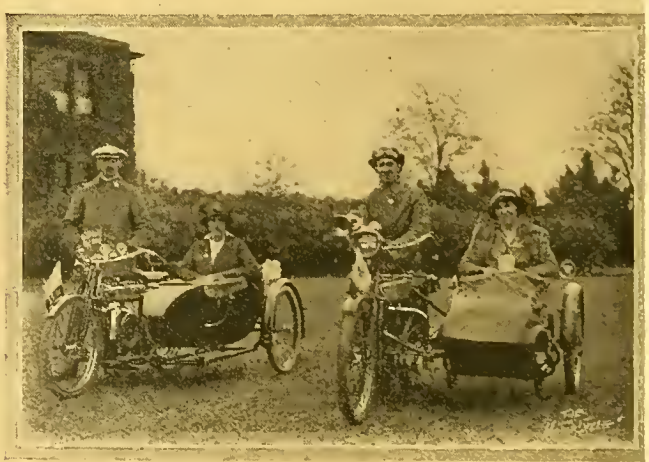
EVENT 7.—PASSENGER HALF-MILE SPRINT.
Capt. E. W. S. Bardsley (8th Batt. The King's Own), Indian, 994 c.c.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
Asst. Paymaster C. P. Marcel (R.N.R.), Indian, 994 c.c.
C.P.O. W. G. McMinnies (R.N.A.S.), Morgan cycle car, 1100 c.c.
Lieut. H. W. Tait (D.L.I.)
2nd Lieut. W. C. Hull (Royal West Kent), Ivy-Precision.
Corpl. F. E. Barker (M.T., A.S.C., Motor Cyclist Section), Zenith.
Also eight others.

EVENT 8.—JUNIOR HILL-CLIMB.
Capt. G. L. Andrew (Army Cyclist Corps), Douglas, 350 c.c.
2nd Lieut. E. H. Dimmock (9th Loyal N. Lancs), Connaught, 270 c.c.
Corpl. F. E. Barker (M.T., A.S.C., Motor Cyclist Section), Zenith.
Also five others.

EVENT 9.—SERPENTINE SLOW RACE.
2nd Lieut. V. Spencer Daniell (8th The Buffs), James, 500 c.c.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
Private A. C. S. Irwin (M.C.O.T.C.), New Imperial, 293 c.c.
Lieut. J. H. C. Lindesay (25th Div. Cyclist Company), Rudge-Multi, 499 c.c.
Asst. Paymaster C. P. Marcel (R.N.R.), Indian, 994 c.c.
Private Ed. R. Mecredy (52nd Company, A.S.C., M.T.), Arno, 493 c.c.
Capt. J. H. Storey (9th S. Lancs), Rudge-Multi, 500 c.c.
Lieut. G. H. Walker (25th Div. Cyclist Company), Royal Enfield, 425 c.c.
Lance-Corpl. H. R. Whitmore (Royal Engineers), Lea-Francis, 496 c.c.
Lieut. A. Lindsay (R.A.M.C.), Norton, 490 c.c.
Also thirteen others.

EVENT 10.—MEDIUM-WEIGHT HILL-CLIMB.
Lieut. W. E. Collins (Army Cyclist Corps), Triumph, 550 c.c.
2nd Lieut. V. Spencer Daniell (8th The Buffs), James, 500 c.c.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
Lieut. A. Lindsay (R.A.M.C.), Norton), 490 c.c.
Private Ed. R. Mecredy (52nd Company, A.S.C., M.T.), Arno, 493 c.c.
2nd Lieut. C. E. Medhurst (Royal Flying Corps), Norton, 490 c.c.
Private G. W. Miller (A.S.C., M.T.), Blackburne, 499 c.c.
Capt. J. H. Storey (9th S. Lancs), Rudge-Multi, 500 c.c.
Lieut. G. H. Walker (25th Div. Cyclist Company), Royal Enfield, 425 c.c.
Lance-Corpl. H. R. Whitmore (Royal Engineers), Lea-Francis, 496 c.c.
Private E. G. House (273 Company, A.S.C., M.T.), Rudge-Multi, 499 c.c.
2nd Lieut. W. C. Hull (Royal West Kent), Ivy-Precision.
Also sixteen others.

EVENT 11.—UNLIMITED HILL-CLIMB.
Capt. E. W. S. Bardsley (8th Batt. The King's Own), Indian, 994 c.c.
2nd Lieut. E. W. Hardman (9th Loyal N. Lancs), Indian, 994 c.c.
2nd Lieut. N. T. Herbert (3rd Royal Warwickshires), Zenith, 770 c.c.
2nd Lieut. F. M. C. Houghton (25th Div. Cyclist Comp.), Rudge-Multi, 499 c.c.
Lieut. A. Lindsay (R.A.M.C.), Norton, 490 c.c.
Asst. Paymaster C. P. Marcel (R.N.R.), Indian, 994 c.c.
Private R. A. Waddy (Oundle O.T.C.), Indian, 994 c.c.
Corpl. F. E. Barker (M.T., A.S.C., Motor Cyclist Section), Zenith.
Also eleven others.



A couple of sidecar outfits belonging to Paisley motorists, who used them on recent flag days for war charities for collecting funds. Besides selling flags, people were taken for "joy" rides, and by these means £30 was collected. The machines are a 2¾ h.p. Douglas and a 3½ h.p. Bradbury.

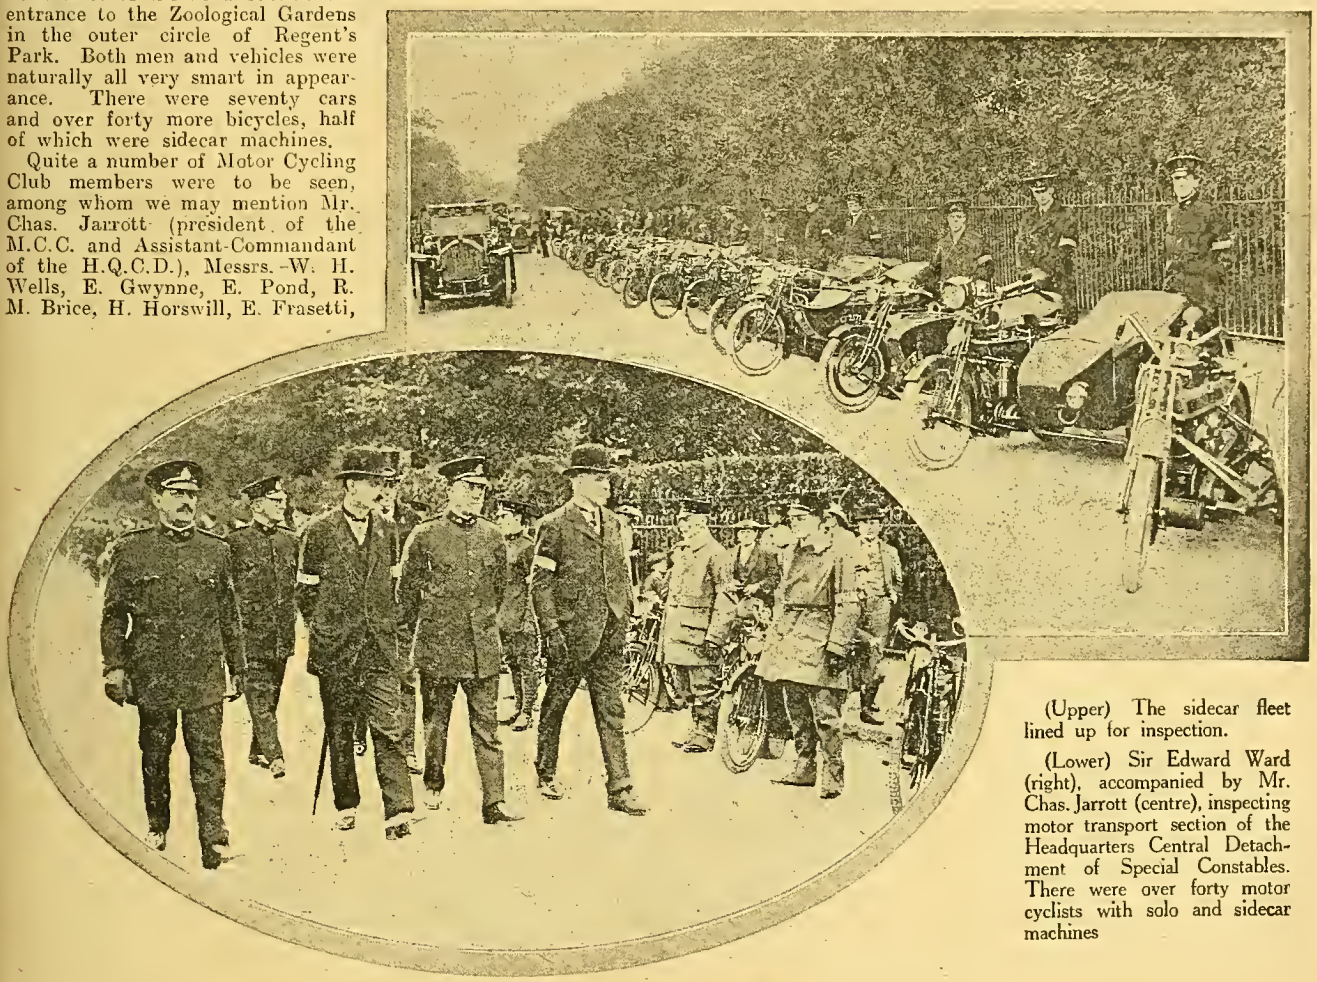
An Inspection of Motor Cyclist Special Constables.

ON Tuesday evening of last week Colonel Sir Edward Ward, K.C.V.O., K.C.B., inspected members of the A.A. in the Motor Transport Section of the Headquarters Central Detachment of Special Constables. All the special constables were in uniform, and were ranged up adjacent to their vehicles, which lined both sides of the road outside the entrance to the Zoological Gardens in the outer circle of Regent's Park. Both men and vehicles were naturally all very smart in appearance. There were seventy cars and over forty more bicycles, half of which were sidecar machines.

Quite a number of Motor Cycling Club members were to be seen, among whom we may mention Mr. Chas. Jarrott (president of the M.C.C. and Assistant-Commandant of the H.Q.C.D.), Messrs. W. H. Wells, E. Gwynne, E. Pond, R. M. Brice, H. Horswill, E. Frasetti, O. C. Godfrey, F. Applebee, and S. Dixon.

The inspection was made by Sir Edward Ward and his staff among whom were Assistant-Commandants C. Jarrott and C. Temperley. An attempt had been made to hold this inspection on the previous Tuesday, but the heavy rain had prevented it.

Sixteen motor cyclists are on duty at the A.A. headquarters every night till 1 a.m. In the event of an emergency, the duty of these men is to call up the car owners, who, in turn, pick up the ordinary special constables and convey them to Scotland Yard. Keen motor cyclists are still wanted by the A.A. for this work.



(Upper) The sidecar fleet lined up for inspection.

(Lower) Sir Edward Ward (right), accompanied by Mr. Chas. Jarrott (centre), inspecting motor transport section of the Headquarters Central Detachment of Special Constables. There were over forty motor cyclists with solo and sidecar machines

Cork Bank Holiday Trial.

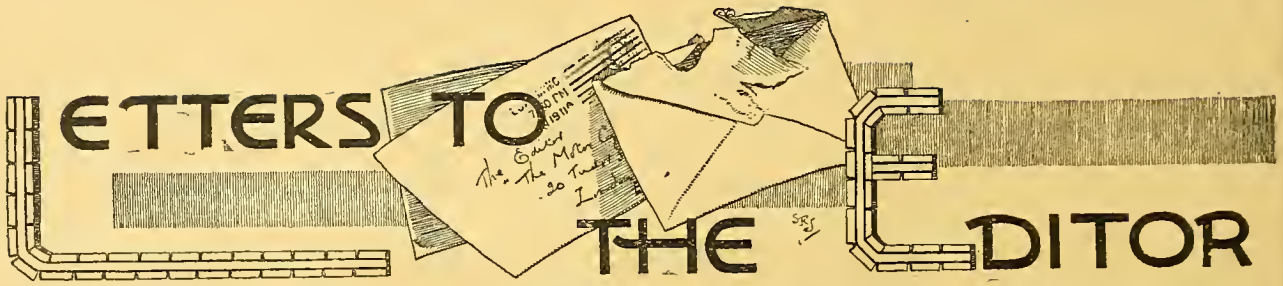
THE Cork and District Motor Cycle Club ran a one-day trial on the Bank Holiday from Glengarriff. The week-end weather was very unpromising, but it was quite fine when the first of the Cork men set out at 8 o'clock for a circular run in the mountains of Kerry.

As usual, the Hon. Sec. (R. S. Russell) was allotted the post of honour as route finder, and promptly to time he left for Kenmare. Twenty-three entries were received for the event, and of these seventeen were despatched as under at the customary one minute intervals :

R. S. Russell (2¾ Douglas)
J. Gibbings (3½ Indian)
E. G. Jack (3½ Rover)
J. J. O'Shea (3½ P. and M.)
W. J. Markham (2¼ Triumph)
R. Swanton (3½ Indian)
F. L. Dooly (4¼ B.S.A.)
E. V. Whittaker (4¼ B.S.A.)
J. Hennessy (5 Indian)
J. Wilson (3½ Triumph)
G. Pring (4 A.J.S. sc.)
W. P. Musgrave (4 Triumph sc.)
C. M. Ryan (3½ Indian)
D. Lucy (2¾ Douglas)
Sergt. Hughes (2¾ Douglas)
Lance-Corpl. Thompson (4¼ B.S.A.)
J. Cross (6 Enfield sc.)

On the ascent to the Tunnel, on the Kenmare Road, the first portion of the flexibility test was taken, the men being asked to cover a sixteenth of a mile of an easy gradient slowly. The slowest time was that of A. S. Whitaker, on a 4¼ h.p. B.S.A., who took 62s. over the distance. The fast portion of the test was taken on the return journey to Cork. The ascent of Gowlane Hill brought four riders to grief. Markham (2¼ h.p. Triumph) approached the ascent with a hot engine and failed, and although he made a clean ascent after cooling his engine, by going down to the foot, he retired. J. Wilson (3½ h.p. Triumph) broke a valve, and went on after replacing it, but, losing his way afterwards, he also retired. The other failures were Sergt. Hughes (4¼ h.p. B.S.A.) and W. P. Musgrave (4 h.p. Triumph sc.).

After Gowlane, two of the best known passes—Ballaghabeam and Ballaghosheen—were taken *en route* to Waterville, where an hour was allowed for lunch. The severity of the route led the committee to add thirty minutes to the customary 20 m.p.h. schedule. After the luncheon interval the men returned by an easy road to Kenmare, and on the way across to Macroom a new hill was taken in over Sheedy mountain. The day's run ended at Cork with a total mileage of 173½ miles.

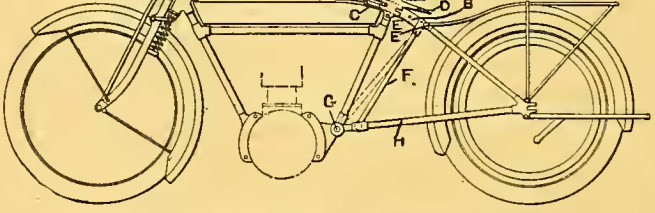


The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Rear Springing.

Sir,—As the patentee of one of the devices referred to in Mr. Eric Walford's able article in the last issue of your splendid journal, viz., fig. 11, I am naturally greatly interested, both in the article referred to and also in your editorial. I would like, if I may, however, to point out, for the information of your numerous readers, that the diagram (fig. 11) accompanying Mr. Walford's article fails in a very important point to give the best and most simple application of the device. May I, therefore, correct the impression created by the previous sketch by submitting the more modern one (also protected) which accompanies this letter? It will at once be apparent that, while in the first design the tank space was encroached upon to make room for the forward movement of the guide plates, in the present arrangement no such objection or disadvantage is present, while generally a much simpler and neater construction is obtained. It will be noticed that the guide block A forms the rear curve of the top tube—is, in fact, a specially designed seat-pillar lug forming the junction of the top with the seat-pillar tube. In the design now depicted, the weight-carrying and shock-absorbing springs (omitted for the sake of giving an unimpeded view of the guide block A) are anchored at points C and D, while the front tube of the rear triangle F may, if desired, be duplicated, and the lower extremities brazed to projections on the main lug G. The "snubbers," or recoil springs, are fixed to points E E. A good position for the countershaft



Sketch accompanying Mr. C. E. Palmer's letter.

gear is indicated at H, when all three centres would be in line, and the movement at H (or possibly nearer the point G) would be so trifling as to be negligible, even in an all-chain drive. The movable rear frame being positively held against any tendency to side-sway, both at its top extremity (by the guide block closely embraced by the slide plates) and at its bottom extremity (by the substantial and adjustable pivot), gives a frame which laterally is as immune from side movement or tail wag under stress as is the old type rigid frame; no movement is possible other than the desired vertical movement controlled by the springs. The guide plates B are securely pinned together by accurate shouldered bolts before and behind the seat-pillar line, and also, of course, to the flat-faced terminal lug at the apex of the rear triangle. The system gives a mount that may be ridden as a "rear-sprung" or as a "rigid" mount at the will of the rider, simple means being provided for locking up the rear to the main frame, in a moment, and by the use of a spanner only. It can be ridden, all out, over bad surfaces in comfort and without danger to the main frame through vibration, which is never the case where the springing is provided for the rider only.

Another application of the same principle is included in my specification, applicable to frames having the straight but rearwardly declining top tube (such as the Allon or the Enfield), and in this scheme the springs may be enclosed entirely within the top tube. All working parts and springs are out of the direct path of mud, dust, and rain, and the extra weight is very trifling. C. E. PALMER.

Petrol Consumption.

Sir,—Your issue of July 15th contained an interesting article by "Ixion" referring to the excessive consumption of petrol with motor cycles in general as compared with light cars. Whilst agreeing that the figures mentioned are approximately the average, I must say that they by no means represent the mileage that may be easily obtained if an efficient carburetter is employed and properly fitted. One of the principal causes of high consumption is due to the vibration to which the machine is subjected and the use of the old type of single jet carburetter, in which the jet remains the same size at all throttle openings. With this type the jet must be of sufficient area to meet the utmost demands of the engine at maximum speeds, and also permit of the suction being so reduced that only sufficient fuel is delivered for slow running, the result being (as pointed out by "Ixion") that fuel in excess of the engine requirements is ejected from the jet at medium throttle openings; in fact, when a bad pot-hole is encountered the engine will cease firing until the excessively rich mixture has passed out of the exhaust.

Objection to changing gear unless absolutely obliged is another cause of excessive consumption, there being many users who invariably "blind" up a hill rather than risk changing gear, and finish the hill with the air lever closed and dense black smoke issuing from the exhaust, whilst had the machine been driven to a point where the engine just commenced to labour, and then changed to a lower gear, the hill would have been climbed faster, with a less consumption of fuel, and without fouling the interior of the engine. Another point is the design of the inlet pipe, more especially with twin-cylinder engines, it being absolutely essential, if maximum economy, prompt acceleration, and good slow running are to be obtained, that the inlet pipe should be kept at a temperature sufficient to obviate condensation, otherwise misfiring is bound to occur, especially when opening up, and also freezing of the carburetter in winter weather.

Blow-back is mentioned as being another source of wastage. This, however, may be practically eliminated by correct cam design, and considerably minimised by the fitting of a suitably proportioned extension at the rear of the carburetter.

Regarding the objection raised to small jets and their liability to choke, this depends largely upon the design of the jet. I may say that there are a large number of our carburetters in use on waggons weighing upwards of 9 tons laden and using crude commercial spirit, and I have yet to see a stopped jet.

Although there are instances of extremely high mileage being recorded with motor cycles, the speed at which they were accomplished, together with the total weight of machine and rider, has not, to our knowledge, been published, and, without this essential information it is impossible to judge the merit of the performance. We have avoided comparisons with the results obtained by some of our clients and, the figures mentioned by "Ixion," but, of course, shall be pleased to furnish particulars on application to those interested.

EVEREST CARBURETTERS, COVENTRY.
ERNEST P. EVEREST.

Tyre Repairs.

Sir,—In your issue of July 8th, Mr. McBratney, in an interesting letter on "Retreading," speaks of having discarded a tyre possessing a good tread through breaking away at the bead. I myself discarded a good tyre (excepting a loose bead) last winter, and fitted a new one. I later conceived the idea of having the bead sewn down on a boot-sewing machine, getting the bootmender to use the longest stitch the machine would allow, so as not to weaken the canvas by a close perforation. This job cost 4d. I then tried the tyre on my front wheel, and was pleased to find that the stitched portion was nicely hidden by the rim all round. I have so far used the tyre all the season, and have piled up a fair mileage, but it has not budged. I only take one precaution, and that is not to inflate too hard—particularly on hot days. My new tyre I am keeping for next winter's slop and dirt. J.D.

The Cycle and Motor Trades Benevolent Fund.

Sir,—The value of the Cycle and Motor Trades Benevolent Fund has been brought home to me by practical proof of what this organisation can accomplish.

Two years ago one of our salesmen, while riding a motor cycle, met with an accident which ended fatally, and he left a wife and three children under five years of age. The case was brought to the notice of the Benevolent Fund, the administrators of which at once provided for the widow's immediate necessities, and took steps to get the eldest child into an orphanage. Through the thoroughness of the organisation and its influence, this child has been now elected, and has headed the poll in the election, thus assuring the child's future in life and relieving the mother of the burden of her support.

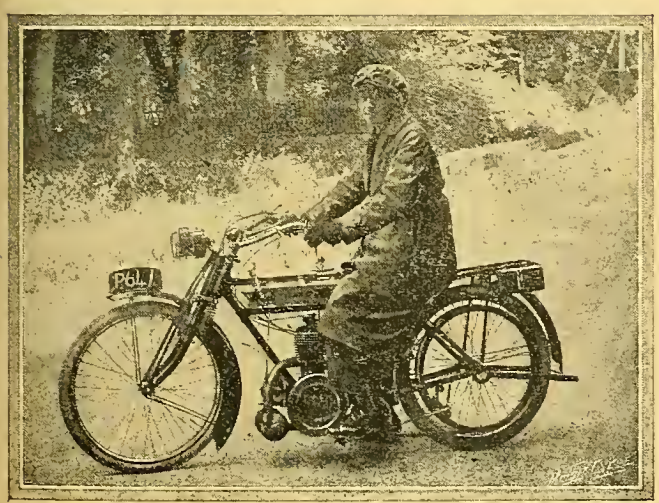
I am sending this letter in the hope that it will be read by men eligible to subscribe to the fund, but who have not yet done so, and that they will immediately take steps to identify themselves with an organisation which is doing so much good to those members of the trade who have fallen under bad times. The hon. sec., Mr. A. J. Wilson, 154, Clerkenwell Road, London, S.E., will be only too glad to send full particulars on receipt of a postcard.

E. C. PASKELL,
Proprietor Colmore Depot.

Lady Motor Cyclists.

Sir,—In reply to Mrs. Marshall's letter, I have ridden a motor cycle during this season and last, but have never been once hung up on the road through breakdowns, and would also mention that even if I have stopped only a few minutes to pump a tyre or any other minor detail, I have had heaps of willing offers from passing motor cyclists, and I can now go out on my machine with full confidence that, should I be unfortunate enough to have trouble, there will be always plenty of male sympathisers who will assist me to get home.

There should be no fear of road troubles on an up-to-date machine. AMY HARRIS.



Miss Amy Harris and her two-stroke Tyler. (See letter on this page.)

Broken Exhaust Valves.

Sir,—The following tip may be of interest to readers who are unfortunate enough to have an exhaust valve break some distance from a town. I recently broke my exhaust valve five miles from any garage, and not feeling inclined to "push," I hit upon the idea of replacing the broken exhaust valve by the inlet valve, and making the broken exhaust valve work automatically, which, I believe, is a fairly old dodge. The difficulty I experienced, however, was that the broken valve would not remain square on its seating, so I filed a groove round the stem just under the head and fastened a small spiral spring to the valve head, the other end of the spring being taken down the valve stem guide and secured, with sufficient tension to keep the valve head from falling sideways on to the seating. I then plugged the hole at the bottom of the valve stem guide with wood to prevent a leakage of air from this source, and my pains were rewarded by being able to ride comfortably to the next garage, five miles away.

Of course, the moral is "always carry a spare," but these things usually happen when one has left the spare at home.

W. D. EDWARDS

Despatch Riders at the Dardanelles.

Sir,—I have just received a copy of *The Motor Cycle* dated June 24th, which is the first I have seen since the first landing here at the Dardanelles. Before the war I had been with the motor cycle trade since my schooldays, so that *The Motor Cycle* is an old pal.

I have read with interest Cpl. C. M. O'Connor's letter on "Despatch Riders' Work." If, as he says, the risk in many cases is enormous, what must be the risk of the slower moving traffic, which forms a much better target and is much more likely to draw shell fire. Here on this Peninsula, all at times are subject to heavy shell fire, so that I cannot at present make comparisons, but hope to be able to say more later.

There were no roads here when we landed, and even now they are only a combination of sand and bumps. I do not think that the conditions could be much worse for our motor cycles and men, but both are doing remarkably well. At present only Triumphs and Douglases are being used. Our Section has three B.S.A.'s, but so far has used them but little. The Douglases are dropping their mudguards and odd fitments, but still keep plogging along. One has to ride here with fairly soft tyres, to lessen the shocks.

ALAN V. BAKER,
Mediterranean Expeditionary Force.

Oxford Roadways.

Sir,—I notice that you are soliciting information with regard to the present state of the roads. It is a great pleasure to me, and an even greater relief, to say a few words on the condition of what are still described as streets and roads in and around Oxford.

With its characteristic indifference to modern requirements, Oxford has allowed its thoroughfares to become a corrugated abomination. Their surfaces give examples of every imaginable sort of ridge, pit, crater, and crevasse. I often take a stroll up St. Giles's after dinner, picking up washers, nuts, and even tail lights; and, though I ride with every care for my own comfort and the efficiency of my motor, a spanner has to be thoughtfully applied after every run. Certain makers might well feel proud of their products could they see them jumping on the Woodstock Road, under the guidance of daring subalterns. It is true that belated and costly repairs are now being begun in some parts, but the general condition is the same. Motor 'buses are largely responsible for this state of things. The Oxford Borough Council does not seem quite to realise the action of continuous heavy traffic on road surfaces.

The Woodstock Road improves after Wolverton, and is excellent before Woodstock is reached. The Banbury Road is bad. The eastward roads are all bad. The Abingdon Road is tolerable. The Henley Road is excellent after Littlemore. The Cheltenham-Oxford road, generally speaking, is good.

A short ride on a public Daimler (and a wonderfully fine engine it has) would convince you, sir, that those who are intrepid enough to travel on top over Oxford roads are well qualified to judge of the hardships of transport work in Flanders. C. E. VULLIAMY.

Some Notes for Fast Tourists.

Sir,—I was much interested in the article by "Miles" on this subject in your issue for July 15th. I came down from Scotland to Nottingham, 360 miles, in thirteen hours on end, which I do not think was bad. My machine is a two-speed Douglas, and I can get forty-five miles per hour. But why does the writer say that semi-T.T. bars are best? Surely they tire one's back more on a long journey. My raised bars are quite comfortable. A. H. BRYAN.

Magneto Rear Lights.

Sir,—I must apologise to your correspondent "HE 118" for having failed to answer his letter of enquiry sooner. Although in some cases a bell bobbin will act fairly well as a choking coil it has two disadvantages, the core is solid iron, and it is wound with too many turns of wire. By this I mean that, although the wire may be suitable as to actual length and size, many of the turns are too far removed from the core to be of much use. If your correspondent will make the core of soft iron wires, as explained to those who wrote for particulars, and wind not more than four layers of wire, I feel sure he will get good results. I have found that the common electric torch 3½ volt lamp will work quite well, and by arranging another lamp in series with the rear lamp and placed on top tube or somewhere in sight, there is never any doubt as to whether the rear lamp is alight, in addition to which the front lamp can be of use for illuminating speedometer or watch, etc. The 4 volt Osram lamp is quite satisfactory, and will be found to outlast the cheaper torch lamps. I should advise making the choker of iron wires made into a bundle, having a diameter of approximately ⅜in. and 2½in. long.

In reply to the last query, I have not tried a ring transformer, and doubt if it would work. The choker is simple and cheap to make, takes up little space, and gives every satisfaction.

If "HE 118" would like any further particulars I shall be pleased to give them. As a result of my letter I received a great many enquiries, and replied direct to all those correspondents who enclosed a stamped addressed envelope for reply. SHAZBAZZIK.

Running Costs.

Sir,—I am sending you the cost of running a 1913 Douglas for two years. You will see it works out at just about 1d. per mile. I think everything has been taken into the cost. Depreciation is by far the greatest item. I exchanged the machine for a 1915 Douglas, and the £18 is exactly what I dropped.

You will notice that fuel works out at five miles for a penny. I am quite satisfied with the Douglas; it takes me up all the hills I have come in contact with, and my weight is 16 stone. The only fault I can find is that the chain from engine to gear box should be a much stronger one.

FROM MARCH 12TH, 1913, TO MARCH 18TH, 1915.

					Per mile
Distance travelled, 10,800 miles.					
Depreciation				£18 0 0	= .40d.
Fuel—					
102 gallons of petrol ...	£8	2	6		
7½ gallons of oil	1	10	5		
(Petrol = 106 m.p.g.)				9 12 11	= .21d.
Maintenance—					
Tyres	£3	10	5		
Engine and ignition	1	0	0		
Transmission and fittings, etc.	2	9	8		
Carbide		14	3		
				7 14 4	= .17d.
Taxes, Insurance, etc.—					
Taxes and licences	£2	15	0		
Insurance	4	18	0		
A.C.U. and clubs	1	2	6		
Clothing	1	7	3		
Loss of interest at 2½% ...	.2	5	0		
				12 7 9	= .28d.
Total				£47 15 0	= 1.06d.

LH 21.

Wear in Inclined Engines.

Sir,—Have you or any of your readers ever noticed the slight knocking that starts in engines of the inclined type after 2,000 to 3,000 miles? This knocking has always caused me a lot of trouble, to say nothing of the expense in getting it cured. In every case reboring stopped the knocking, showing clearly that it was wear in the cylinder. I have been a keen rider of a well-known inclined engined machine for the last three and a half years. Every one of the three machines developed this elusive mysterious knock. The first two models were a 1909 and a 1911, bought second-hand. The 1909 was badly worn, and was sold without reboring; the 1911 had to be rebored after 2,000 odd miles, and the knock commenced after reboring at 2,500 miles. I then replaced the small end in the connecting rod and a new gudgeon pin, but with no better results. Finally, I had again to get it rebored, which cured the trouble.

SPANNER.

A Canadian's Opinion.

Sir,—I think English manufacturers should consult the tastes of Canadians more, and there would be more English machines sold in Canada. As it is, Indians, Excelsiors, and Harley-Davidsons predominate here. If I could get an English Douglas or a Triumph with American handle-bars with the "twist the wrist" system, I think I would take it; but the handle-bars supplied on English machines, with their multi-controls, are a nightmare to us Canadians. Then again your small 26in. wheels and 2½in. tyres are no good for our roads. We use 28in. × 3in., and the twin engine is the most popular here.

Please pardon these few suggestions. I thought you might possibly like to have an expression of opinion from this side of the pond. I have been a reader of *The Motor Cycle* for a long time. A. A. STEWART.

Toronto, Canada.

A 1915 4 h.p. Triumph beside King Richard's statue outside Westminster Abbey. Richard Cœur de Lion was named Lion Heart through bravery on the battlefield. In a like manner the modern motor cycle is winning fame for itself on the battlefield.

Stewart

Motor Cycle

SPEEDOMETER

AN accessory indispensable to the motor cyclist who desires to keep accurate check on running cost. But its chief purpose is to keep you informed of the speed. Fast or slow, no matter how rough the road, you always know exactly the rate at which you are travelling. Stewart figures are dead accurate, and you can read them at a glance.

50/-

Registers from Zero to 75 m.p.h. Season Mileage 10,000 and repeating. Trip recorder 100 and repeating. Will fit either side of front wheel or back wheel fitting supplied at no extra cost.

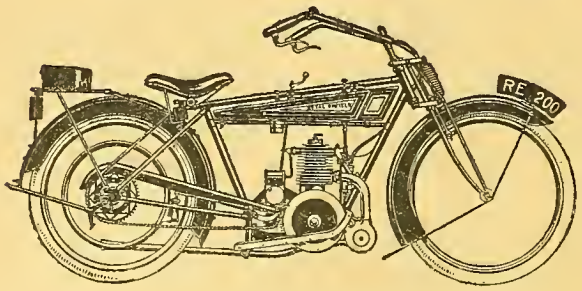
The Cooper Stewart Engineering Co., Ltd., 11, Broad Street, Bloomsbury, London, W.C.

All Royal Enfield Motor Cycles are fitted with the Enfield patent Two-speed Gear and Chain Transmission

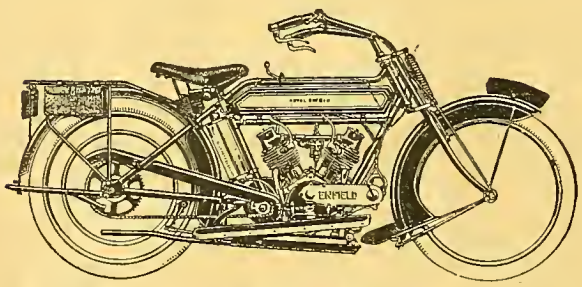
ROYAL ENFIELD

MADE LIKE A GUN



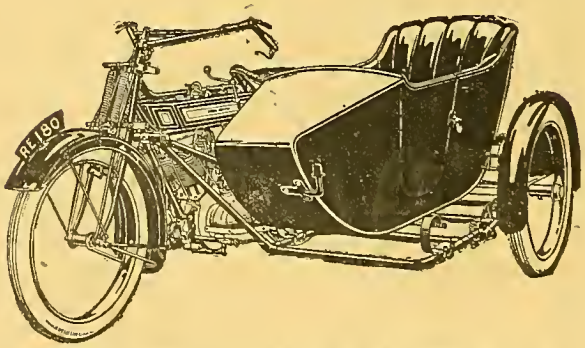
Model No. 200. The 2¾ h.p. Royal Enfield Two-stroke Lightweight, fitted with the Enfield two-speed gear, cush drive hub, and chain transmission. The handiest machine yet produced. Starts with the rider astride the machine, and makes traffic riding a pleasure.

Price, 38 Guineas, net cash.



Model No. 140. The famous 3 h.p. Royal Enfield Twin-cylinder Model, fitted with the Enfield two-speed gear, etc., and mechanical forced feed lubrication. In the Swedish Winter Motor Cycle Trials — probably the most severe in the world — 3 h.p. Royal Enfields took all the awards.

Price, 50 Guineas, net cash.



Model No. 180. The Royal Enfield Sidecar Combination, fitted with the Enfield two-speed gear, etc. Exceptional power and reliability are embodied in this model. As supplied to the British Army, the Russian Army, and the New Zealand Postal Authorities.

Price, 80 Guineas, net cash.

(With dynamo lighting set, etc., £100 net.)

For whatever purpose you need a motor cycle there is a Royal Enfield model to suit. Consider the merits of the machines illustrated here — and then let us send you the fullest particulars of the model which interests you most.

All Royal Enfield motor cycles, from lightweight to sidecar combination, are fitted with the famous Enfield Two-speed Gear, Cush Drive Hub, and Chain Transmission. This is a *standardisation* of reliability all Royal Enfield riders enjoy.

Write for the Royal Enfield Motor Cycle catalogue. Please mention "The Motor Cycle."

Where the Military Motor Cycle can be Improved.

Sergt. Cocker, of the M.M.G.S., emphasises the Call for Special War Models.

THE day following our talk with Sergeant Pountney (referred to in our last issue on page 100) we had a call from Sergeant J. Cocker, who is with the same battery (No. 5). Cocker was enjoying seven days' leave after three strenuous months in the firing line, and was looking in splendid condition.

Originally he told us he had doubts as to the success of the M.M.G.S., as no real opening seemed to be found for them, but he had since discovered that the batteries are useful for many operations. For instance, they are used as infantry in the trenches, for attacking enemy aeroplanes in conjunction with anti-aircraft guns (the latter cannot fire directly overhead, which a machine gun can), and for harassing the enemy from various different points at night or day. The success of these efforts is proved by reason of the German artillery wasting so many shells in trying to find the machine guns. No doubt the ammunition shortage has been exaggerated. At any rate, whatever may have been the case elsewhere, it is a relief to know that there is no shortage of machine guns or ammunition, so far as the M.M.G.S. is concerned.

Cars are used occasionally to take men and guns up to the firing line, as the motor cycles are stored well in the rear. It will settle many controversies to hear from Cocker that the old plan of using the sidecar outfits for conveying men and guns as near the firing line as expedient, and then carrying tripods and guns to vantage points, has been retained. For offensive operations the cars are kept well in the rear. It is the exceptional trench warfare conditions which have given rise to slight changes of tactics.

Special War Models Necessary.

Cocker's opinions on the question of design are worth having in view of his experience as a competition rider and record holder. He told us emphatically that practically every part of every make of machine could be strengthened with advantage. Mudguards, fork springs, and carrier attachments are a source of real trouble, whilst frames break in the very severe work to which the machines are subjected. Even saddles break the supports, tearing away the leather. In other words, "war models" are needed.

Sergt. J. Cocker.

Cocker has conversed with well-known riders at every possible opportunity, and he asserts without hesitation that there is not a single perfect machine at the Front.

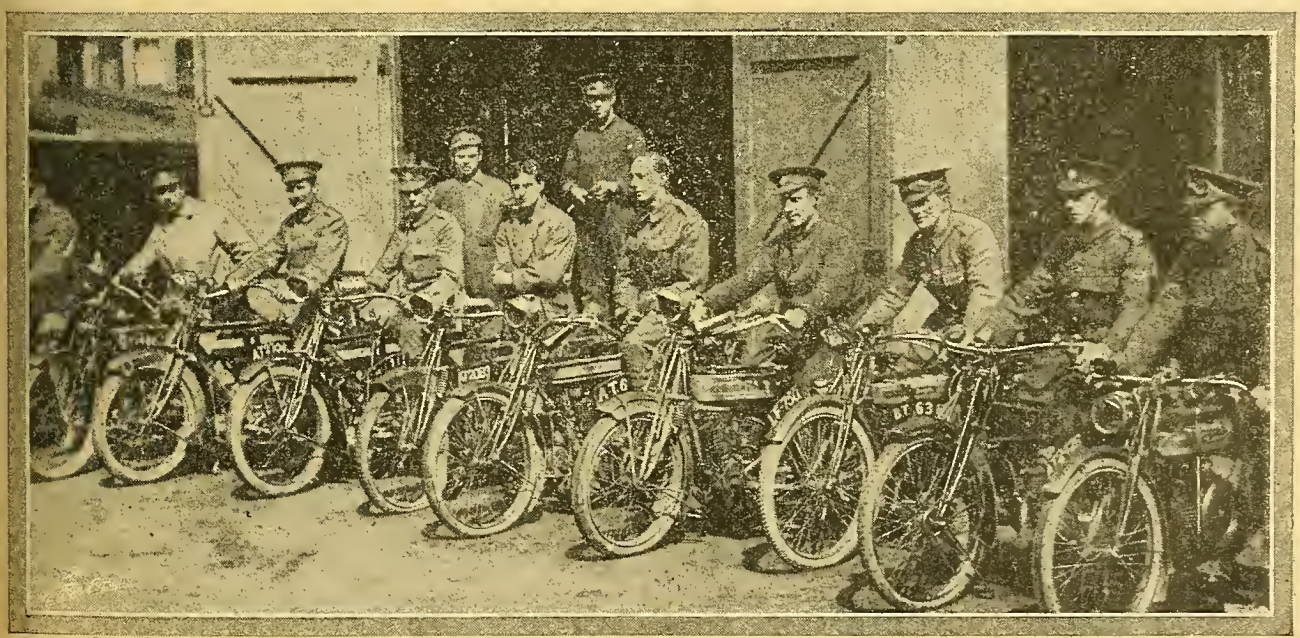
One or two makes stand up above the rest, but a number have notorious weaknesses. He agreed with our suggestion that the War Office could not do better than appoint some expert to collaborate with the leading users of machines at the Front, and prepare a report on the weaknesses of their mounts, and point to parts needing improvement.

The wastage of war is a well-known fact, but opinions vary greatly as to the average life of a machine on active service. There are doubtless many cases in which motor cycles are "scrapped" for no good reasons, and Sergt. Cocker told us of an instance in which an officer found an abandoned Rudge—almost new—by the roadside near Ypres, which on investigation was found to be suffering only from a sooted plug! But six weeks (which has been cited as the average life of a motor cycle at the Front) is not the life of every motor vehicle, for the original Enfields of the No. 5 Battery are still in use. There have been no fork breakages and no hub troubles. One or two engines have been rebushed; but, generally speaking, their behaviour has been exemplary. The light car tyres fitted have saved many roadside stops. The machines at present regularly perform the work of transporting rations to the trenches—when it is dark, of course!

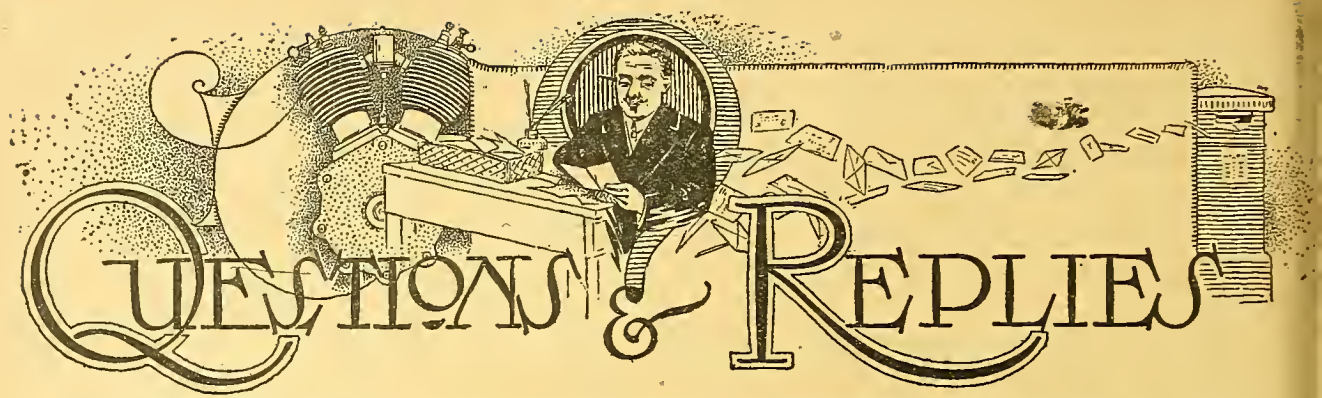
Blown off a Machine.

Cocker has had some exciting experiences, the most unique of which is that of being blown off his machine from the effect of a shell which burst some distance away. He likens it to being on a moor with a hurricane blowing, and a gust suddenly lifting him and his machine (a Douglas) bodily across the road into the opposite ditch. Whilst Cocker was in the ditch and looking round he immediately bethought himself of the 1912 Six Days Trial, when Dartmoor was crossed in the teeth of a gale.

Casualties have been few. The men are looking forward to the time when the advance commences, so that the sidecars with their machine guns may have a chance of showing their work in open country.



Despatch riders attached to the 5th East Yorks (Cyclists) Regiment. Reading from left to right: Lance-corporals Baggs (Triumph) and Willford (Precision), Sergt. Theakston (B.S.A.), Lance-Corporals Calam (B.S.A.), Chester (A.J.S.), Barringer (Norton), Artificer Powles (Rex), Lance-corporal Taylor (Douglas), Corporal Owst (Alion), and Lance-corporal Bowman (Douglas).



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Transfer of Registration.

I am on the point of buying a good second-hand machine. May I ask you to tell me what transfers are necessary and how they are negotiated.—A.G.

Provided the registration has not been cancelled by the previous owner, the number can be transferred to your name for the sum of 1s. The matter is arranged with the clerk of the county or borough council with which the machine was originally registered; for instance, for EL you apply to Bournemouth. The registration only is transferable.

The Petroil System.

Do you think the petroil system of oiling would be suitable for my 1911 3½ h.p. two-speed machine, which pulls well, but has a very nasty habit of overheating, even on the level? I have the machine geared low, as it is a very hilly district here (Whitby).—G.T.L.

We do not recommend the petroil system for use with four-strokes, as the oil would be fed to the cylinder instead of to the crank case, and the result would be very unsatisfactory. Probably a smaller jet would stop the overheating from which you are suffering, or you might try the effect of Harcourt radiators.

Removing a Timing Pinion.

I am taking down my 1907 Triumph engine for repairs, and my trouble is that I cannot get the timing pinion off the engine-shaft. It appears to be keyed on, and also held by a countersunk screw, which I have been unable to move. If you can advise me as to what would be the best way to remove the pinion I should be obliged.—H.V.H.

The countersunk screw must be removed, and to do this it is necessary to soak it with paraffin. Obtain an 18in. screwdriver, apply force with it centrally on the screw head, and turn the driver with a large screw wrench. Such a method should remove the most obstinate screw after one or two tries. However, if it cannot be removed in any other way it must be drilled out, after which the best way of getting the wheel timing pinion off is to use a timing wheel pinion drawer, such as that supplied by Messrs. Lake and Elliot, Albion Works, Braintree, Essex.

Lubricating the Change-speed Gear.

I should be much obliged if you would give me advice on my two-stroke two-speed lightweight motor bicycle. How often must I oil the countershaft gear? What oil would be best to use, and how much each time?—FX 2816.

Use engine oil. It is difficult to tell you how often to lubricate the gear. It depends upon how long the oil stays in, and also upon the means taken by the manufacturer to keep it in. The level of oil should be up to the gearshafts.

Advice to a Beginner.

Would you give me your advice as I do not understand motor cycles, and have been trying to gain some information from your paper, which I find very useful? (1.) Can I get a light motor cycle to do about a hundred calls a day for town work and at the same time use it for sidecar work when required? I do not want to go in for a high speed mount, but at the same time I want a mount which will take any hill. (2.) Would you recommend a new or second-hand machine, as I am not desirous of paying more than £30-£40, complete, including sidecar? I must have easy starting, and I should prefer a low-powered machine, if you think this will answer my purpose.—W.H.J.

(1.) A lightweight motor cycle is very useful as a solo mount, but for sidecar work you have not sufficient reserve of power, nor yet strength, and it is not advisable to fit a machine under 3½ h.p. with a sidecar. (2.) We should advise you to buy a second-hand machine of first-class manufacture, about 3½ h.p. You would get one of these for about £40, with a sidecar. You will naturally not buy without a trial run, and this will tell you whether or not the machine starts easily.

"MOTOR CYCLES AND HOW TO MANAGE THEM" is recognised everywhere as the standard handbook on the motor cycle. The seventeenth edition (revised) is now ready, and can be obtained from "THE MOTOR CYCLE" Offices, 20, Tudor Street, London, E.C. Post paid, 1/3 per copy.

Carburetter Adjustments.

Would you advise me on the following: I have a new machine with a 2½ h.p. two-stroke engine, and I can only get about 30 m.p.g. It is fitted with a special two-stroke carburetter, and when I purchased the machine it was fitted with 26 jet. I have since put a 24 jet in, but it has not made much difference in the consumption. I can drive with the air lever practically anywhere, and it is only when the air is nearly closed that the engine stops. Sometimes it is necessary to have the throttle wide open for about half a minute, and then close down again before the engine will cease four-stroking. I do not get four-stroking when using benzole.—W.W.

We should advise you to use a smaller jet, and to check every possible point for petrol leakage. If you use the petroil system of lubrication this should not be difficult, as the oil will collect where any leak occurs.

An Unaccountable Knock.

I recently purchased a 1914 4½ h.p. sidecar combination through a dealer of repute who was supposed to overhaul it thoroughly before delivery. I find that, although the machine runs well on the level, when I come to quite a slight hill there is such a pronounced metallic knock that I am obliged to put in second gear. By retarding the spark I can stop this for a little while, but if the incline is at all lengthy the knock quickly comes on again. If I try to accelerate quickly the knock occurs even on second gear. When I got the machine the Senspray carburetter was fitted with a 44 jet. I have now fitted a 32 jet, but the knock is still there. I shall be glad if you will give me a reason for the knock and tell me how to remedy it.—G.L.

You might try fitting a good plug with a single stout electrode. Do not retard the spark more than is necessary, and try closing the extra air a little immediately the engine is labouring. If closing the air and retarding the spark do not stop the engine knocking, then it is clear that the cause is a worn bearing, and there is no alternative but to take the engine down and remedy the defect.

Leaky Carburetter.

[?] The running of my machine is in every way satisfactory, but the carburetter leaks very badly all the time it is running. I can understand a certain amount of vapour blowing out, but there is a constant drip as well; in fact, I think I must waste nearly as much petrol as I use. Can you also tell me how often to lubricate, given fairly flat roads and an easy speed? Opinions seem to vary on this subject.—W.T.

The trouble is probably due to the fact that the needle valve requires to be ground in, or possibly there may be grit resting on the seat, which prevents the valve from cutting off the supply. There are no hard and fast rules to follow when lubricating an engine; for the most part this operation is left to the rider's judgment. A half pumpful every four miles should give good results for 3½ h.p.

Hints on Gear Manipulation.

[?] Will you please be good enough to give me some practical advice on the handling of a Bowden two-speed free engine gear, fitted to a 4 h.p. single? Should I be correct if I carried out the following: (1.) To change up. Start and run the engine with the clutch out till a good speed is obtained, then gently engage the clutch with the low gear in, lift the exhaust and change gear with compression released? (2.) To change down, close the throttle till the machine is running slowly, and change gear?—T.N.

Your method is quite correct, but (1) the engine should be accelerated sufficiently to allow the load to be taken up on the low gear. As soon as you feel the gear engaged, gradually open the throttle, then accelerate until the machine has attained a fair speed, and change up, releasing the compression, engaging the gear and opening the throttle imediately afterwards. (2.) When changing down it is not necessary to raise the exhaust valve. The engine should be allowed to quicken up a little before the low gear is engaged.

READER'S REPLY.

Bad Running against the Wind.

In *The Motor Cycle* for July 15th, "C.B." is complaining of the running of his machine. Perhaps my experience will assist him. I bought a twin fitted with Senspray carburetter, and found that against a head wind I could not give more than quarter throttle with full air. On looking for a likely cause, I found the float chamber was partly in front of the air intake, and I came to the conclusion that probably a partial vacuum was formed behind the float chamber and in front of the air intake, thus starving the engine of air. I moved the float chamber round until it was directly in front and about half an inch from the air inlet, and my trouble was cured.—X 5224.

EXPERIENCES WANTED.

"R.W.B." (Norfolk). — Metro 1915 T.T. two-stroke, single speed. Speed, reliability, consumption, and hill-climbing.

"J.H." (Manchester).—Morgan runabout, standard model. Hill-climbing powers, wear on tyres, reliability, petrol consumption, steadiness in grease, braking power, flexibility, and speed.

"L.G.R." (Narberth). — Philipson's automatic variable gear and Grado multipulley on a Triumph for a hilly country.

"W.J." (Burnley).—3½ h.p. A.B.C., whether suitable for solo and sidecar work. Petrol consumption, speed, etc.

"L.W." (Dolgelly).—(1.) Grado multipulley. Will it act as starter on lightweight? (2.) Calthorpe-Jap, 2¾ h.p., single speed, four-stroke. Reliability, hill-climbing, cool running, and petrol consumption; also speed on level.

"A.C.P." (Deal).—Omega. Comfort, reliability, speed, hill-climbing, and consumption.

ROUTES

KINGSTON-ON-THAMES TO NEWCASTLE-ON-TYNE.—G.F.

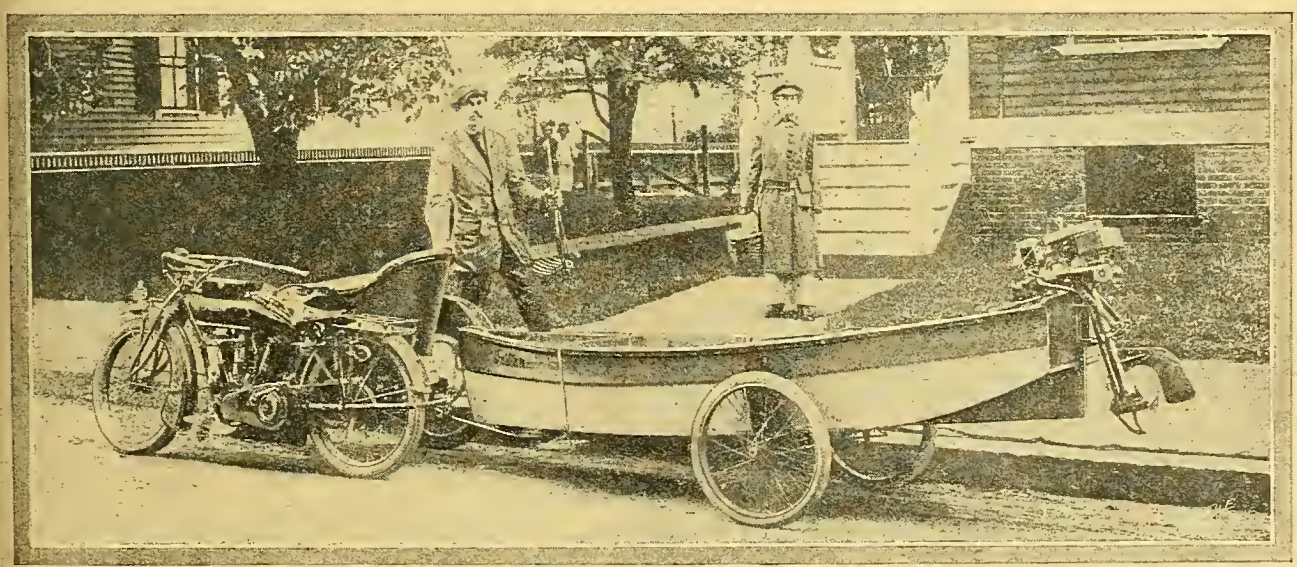
Kingston, Twickenham, Brentford, Ealing, Hendon, Whetstone, Barnet, Hatfield, Welwyn, Stevenage, Baldock, Biggleswade, Eaton Socon, Buckden, Stilton, Wansford, Stamford, Grantham, Newark, Tuxford, East Retford, Barnby Moor, Bawtry, Doncaster, Wentbridge, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming, Scotch Corner, Darlington, Aycliffe, Ferryhill, Croxdale, Neville's Cross, Chester-le-Street, Gateshead, Newcastle-on-Tyne.

DORCHESTER TO COLWYN BAY.—L.K.W.

Dorchester, Cerne Abbas, Sherborne, Marston Magna, Castle Cary, Shepton Mallet, Bristol, Pilning, Severn Tunnel, Chepstow, Tintern, Monmouth, Hereford, Leominster, Ludlow, Church Stretton, Shrewsbury, Ellesmere, Wrexham, Mold, St. Asaph, Abergele, Colwyn Bay. Approximate distance, 225 miles. It is necessary to place machine on rail at Pilning to go through the Severn Tunnel, but there is no difficulty about this, as the railway authorities are quite used to handling motor cycles.

BARROW-IN-FURNESS TO HAMPTON COURT, LONDON, avoiding Metropolis.—W.F.H.

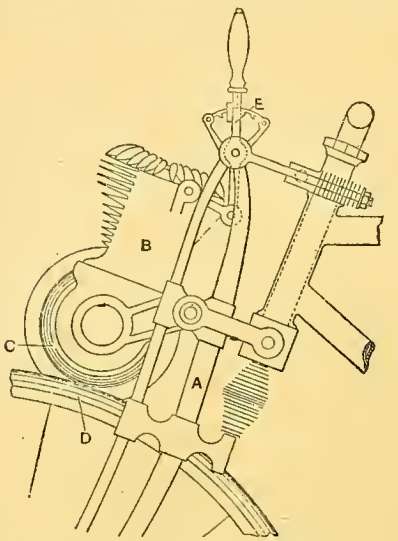
Barrow, Ulverston, Kendal, Kirkby Lonsdale, Ingleton, Settle, Skipton, Ilkley, Otley, Harewood; about two miles south of Wetherby turn right, and go through Aberford, Ferrybridge, Doncaster, Retford, Newark, Stamford, Stilton, Eaton Socon, Biggleswade, Baldock, Stevenage, Welwyn, Hatfield, to Barnet. From here follow R.A.C. London avoiding route (R.A.C. Official Map of Recommended Routes round London, obtainable from *The Motor Cycle* Offices, price 1s. 8d. post free), which intercepts the road to Hampton Court close to Strawberry Hill.



An American motor cyclist and his wife, who are both as devoted to fishing as they are to motoring. They combine the two by motoring to the scene of the fishing operations, and the boat, which is propelled by a detachable motor power unit, is slung on a special chassis and towed behind the Indian sidecar outfit. The boat is twelve feet long, and is sufficiently roomy to provide accommodation for the whole family; when on the road a couple of youngsters occupy it.

An Auxiliary Driving Set.

This auxiliary power plant is carried by a spring fork A adapted for attachment to an ordinary bicycle. There may be a single cylinder B, or two cylinders side by side, and the trans-



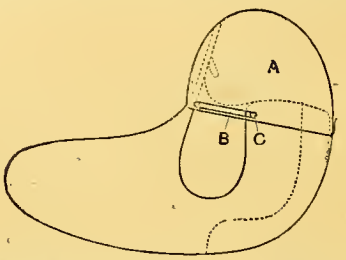
mission is by a roller C acting upon the front tyre D. A free engine effect is obtained by arranging the engine so that it may be raised out of contact with the tyre by means of the rod and

PATENTS by Eric W. Walford

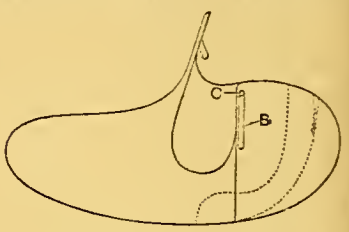
rack device shown at E. Many readers will recall the Ixion two-stroke engine of about 1904, which was arranged in much the same way.—G. Stagni, No. 11,407, 1914.

A Sidecar Hood.

The hood A is of rigid construction, and, when raised, totally encloses the passenger. It conforms with the shape of the rear part of the body, and when



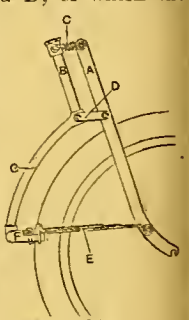
lowered fits around it. The hood is formed with a slot B at each side, which may slide upon a roller C. To bring the hood from the raised position shown it is moved backwards to bring the other end of the slot B into contact with the roller C, and then swung about this as a pivot



into the lowered position.—G. A. E Purvis, No. 2,457, 1914.

A New Spring Fork.

The fork A is connected to the steering head B by links C and D, of which the former is constituted by helical springs. The main spring effect is provided by a laminated spring E at each side, bolted at its rear end to a block F carried by a curved member G connected to the lower end of the steering head. At its forward end each spring E is pivoted on a stud on the fork blade.—B. Lund, No. 5,994, 1914.



Excelsior Motor Cycles.

There is, of course, no connection between the Excelsior machines made in Coventry by Messrs. Bayliss, Thomas and Co. and the American machine of the same name manufactured in Chicago.

A Spanish Agent.

Messrs. F.R.S. Lamps, 7-9, Pershore Street, Birmingham, inform us that their agency for Spain is in the hands of Mr. Harry Walker, Calle Balmes, 84, Barcelona. The firm is preparing a catalogue written and priced in Spanish.

Reviews.

The R.A.C. Official Motor Map of England and Wales. (George Philip and Son, Ltd., 1s. 6d. per sheet.) We are in receipt of sheets 1 and 4 of the above named map. This map is particularly clear, and very handy for touring. All the principal details are marked without any attempt at confusion. Each map is sold in a case with an index of hotels and repairers recommended by the club, and a list of golf courses.

Another innovation is the R.A.C. Record Route Map, by the same publishers. This consists of an outline map, in which the main trunk roads are lightly sketched. The idea is that the tour can be inked in afterwards, and there are spaces left for the date, number of days occupied, make of vehicle used, the mileage, amount of petrol consumed, cost of tour, and members of the party; a file case is provided for the map. This is an excellent idea, as a record of each tour can thus be filed. The maps are sold at 3d. each or 2s. 6d. per dozen, and the file at 6d.

SPARKLETS

An Allon de Luxe.

Messrs. Alldays and Onions, Matchless Works, Birmingham, are putting on the market a *de luxe* model of their Allon two-stroke machine. This will follow the standard specification except that it has a kick starter, clutch, and larger and heavier tyres, and that the fittings and finish are of superior quality. The machine can be enamelled in any desired colour, and the price is £50.

Kaylon: A New Aluminium Solder.

Kaylon is an aluminium solder, used, like other aluminium solders, without flux. When it is required to solder two pieces of aluminium the surfaces to be joined are carefully scraped, with the object of removing the outer oxidised hard skin on the surface of the metal. The metal is then warmed, preferably in a blow lamp, and at the same time the stick of Kaylon, which is held in greaseproof paper, is gently rubbed over the surface. It is extremely important that all grease should be removed, and, as a further precaution, before the aluminium is heated, it may be wiped over with a rag soaked in benzole or petrol. The great aim in the application of Kaylon is to avoid overheating the metal, and the solder should just become fluid, but not absolutely liquid. This state should be maintained while the solder covering the aluminium is rubbed in different directions by means of a special wire brush, enabling the Kaylon to bind well with the surface of the metal, any oxidation of the surface beneath the solder being removed by the stiff bristles of the brush. The faces of the two pieces of metal to be joined are first tinned, and are then placed together, and the heat applied until the Kaylon runs and so forms a connecting skin. This patent solder is claimed to excel others in that it is more permanent, owing to its freedom from oxidation when exposed to the air. Kaylon is sold by Messrs. G. T. Riches and Co., 19, Store Street, Tottenham Court Road, London, W.C.

Catalogues Received.

A leaflet describing Cox-Walker electric lamps. Cox-Walkers, Ltd., North-Eastern Electrical Works, Darlington.

The Tynesider seat. A pillion seat for attachment to the carrier. T. E. Henderson Co., 25, Albion Road, North Shields.

The British Excelsior motor cycle. Bayliss, Thomas and Co., Excelsior Works, Coventry. The working of these machines is illustrated by clear half-tone blocks and line drawings.

We are in receipt of a folder from the Benjamin Electric, Ltd., 1a, Rosebery Avenue, E.C., dealing with the Benjamin electric motor cycle horn, which is to be found on some of the best known American motor bicycles.

The British Montgomery Sidecar Masterpiece. A booklet containing numerous models of Montgomery sidecars of all types and prices. The book is well got up and illustrated, and makes interesting reading.

MOTOR CYCLES FOR SALE.

Miscellaneous.

3½h.p. Motor Bicycle and sidecar, done 750 miles; good condition; £30.—99, Churchfield Rd., Acton. [9441

3¼h.p. Fafnir, in good condition; also 3½h.p. Rex, wants overhauling; seen any time; £20 the two.—156, High St., Peckham. [9421

IF You Want Bargains in second-hand motor cycles you can get them at Wauchope's (cash or easy terms), 9, Shoe Lane, Fleet St., London. [2000

EAGLES.—James, 3½h.p. 1914 twin, 2-speed countershaft gear, kick starter, enclosed chain drive, T.T. handle-bars, all accessories, new condition; £47/10.

EAGLES.—O.K., 2h.p., late 1914, as new, 2-speed countershaft gear, belt and chain drive, semi T.T. handle-bars, all accessories; £23.

EAGLES.—N.S.U. 3h.p. twin, 1914, loop frame, rear springing, 2 speeds, free engine, kick-starter, footboards, Dunlop heavy tyres; £35.

EAGLES.—Rover, 3½h.p., 1914, 3-speed model, with footboards, front and rear lamps, accessories; £42.

EAGLES.—Bat-Jap, 8h.p. twin, 1911-12 model, 2-speed gear, free engine, spring frame; £29/10.

EAGLES.—N.S.U., 6h.p. twin, 2 speeds, free engine, Kempshall tyres, footboards, coachbuilt sidecar; any trial; £28/10.

EAGLES.—Precision, 4¼h.p., 1913, 2-speed, countershaft gear, kick-starter, chain and belt drive, coachbuilt sidecar; £39.

EAGLES.—N.S.U., 3½h.p., 1912, model de luxe (85×88), Amac latest carburetter, N.S.U. 2-speeds, adjustable pulley; £25.

EAGLES.—Any of the above can be had on approval, "The Motor Cycle" deposit system.—Eagles and Co., High St., Acton. Tel.: 556 Chiswick. [X3075

5-6h.p. Motor Cycle and wicker sidecar for 2, twin, 2-speed, B. and B., Bosch, 2½ Dunlops, powerful; £26, or exchange light machine.—Rosebank, Hatton, Hounslow. [9389

SECOND-HAND Motor Cycles.—We have a large stock of machines in excellent condition at very low prices to clear; send us your requirements and we will guarantee to satisfy you.—The Morris Garages, Oxford. [0314

COLMORE Depot only advertise those machines which they have in stock. They are here at the time of writing, but may be sold when this advertisement appears. Anyhow, write at once.—Colmore Depot, Birmingham. [0714

ONE F.N. 2-speed Motor Cycle, lightweight, £25; one F.N., 4-cyl., single speed, £25; one O.K. Junior 2-speed lightweight, £25; one Zenith, 6h.p., and sidecar, free engine, and kick starter, £65.—Graves and Co., High St., Mablethorpe. [9436

IF You Want a cheap motor cycle (solo or combination), you should write or call upon Morgan and Maxwell, The London Motor Mart, 80, High Rd., Streatham, who have Alldays, Auto-Wheels, Bat, Bradbury, Brown, B.S.A., Clyno, Douglas, Enfield, F.N., Humber, Indian, James, J.E.S., Levis, Matchless, New Hudson, N.S.U., Rex, Rex-Jap, Rudge, Singer, and Zenith mounts in stock. Cheap sidecars, speed gears, magnetos, belts, tyres. Write us immediately; we can save you money. [X2562

SIDECARS AND FORECARS.

PHŒNIX Sidecars from £4/17/6 to 14 gns.; write for catalogue, fully illustrating the various models.

PHŒNIX Sidecars.—Special models to suit Indian and Douglas motor cycles.

PHŒNIX Sidecars.—See our latest design underslung chassis, coachbuilt sidecar; 10 gns.; easy terms arranged.

PHŒNIX Sidecars.—We are also making a special coachbuilt sidecar; £8/15.

PHŒNIX Sidecars on hire; exchanges made; good prices allowed for other makes in exchange.

PHŒNIX Sidecars, second-hand; we have always a large selection from 50/-; weekly list published.

PHŒNIX Sidecars are built as sidecars should be; our reputation is a guarantee; see testimonials.

PHŒNIX Sidecars.—100 complete sidecars always on show; call, write, or 'phone.

PHŒNIX Sidecars are manufactured throughout in our own works; originators of the Phœnix Trimo forecar, popular throughout the world.

PHŒNIX Sidecar Dept. (Proprs. Phœnix Motors, Ltd., established 1889), 736, Holloway Rd., and 4, 5, 6, Criterion Mews, London, N. Tel.: Hornsey 449. Telegrams: Sycamix, Upholl, London. [2218

COACHBUILT Oakleigh Sidecar, nearly new; genuine bargain, £7/10; photo.—31, Borough, Farnham. [9378

TORPEDO Sports 1914 Sidecar, lamp, suit Zenith; 6 gns.—Railway Garage, Staines. 'Phone: 46. [9502

COACH Sidecar Bodies made to suit any chassis from £3.—Grey Friars Bodies Co., Croft Rd., Coventry. [X1600

CANOELET Sporting Models and several others in stock from £8.—Lamb's, 151, High St., Walthamstow. [9107

Support for Spring Frames.

SUPPORT for our campaign for rear sprung motor cycles has reached us from many quarters. From readers north, south, east, and west we have received letters urging the desirability of springing the saddle-pillar or the rear portion of the frame of modern motor cycles. Besides this, from evidence we have already collected more than one manufacturer has not passed the subject over without giving it earnest thought and consideration, and though we may see no immediate change in respect of various leading types, the change will come in certain makes sooner or later. A number of firms, too, have been privately testing spring frame devices for some time past, and may ere long hit upon a design which satisfies their ideals both in efficiency and appearance, for as we have already pointed out, the designing of a springing device efficient in absorbing road shocks, which does not develop rattle and is yet inoffensive to the eye, is a most difficult achievement. But motor cyclists must be patient; pressing as the need is for greater comfort, the bad road surfaces we have alluded to are by no means universal.

It will be obvious, too, that an energetic campaign could not be pursued at this juncture with the country, and especially the engineering section, in the state it now is consequent upon urgent Government demands, but a perfect spring-framed machine would be of real advantage to the Government at this time. The shocks to every part of the machine will be cushioned, and the reliability of the machine thus increased. How many cases of broken mudguards, stands, leaky tanks and such like could be overcome by the adoption of a springing device it would be difficult to estimate. But experienced riders know the outstanding need, and though many continue to buy rigid-framed machines, they would willingly adopt spring frame mounts if their pet manufacturer marketed one. The chief need for springing is the huge potential field which would be attracted to the ranks of motor cyclists, particularly of the middle-aged class. Now is the opportunity for mechanical experts to evolve designs which will give them a sure start over their competitors.

The Wastage of War Vehicles.

ONE of the questions which must have entered any thinking motorist's mind in connection with the war is, What will become of the hundreds of Government motor cycles, motor cars, and lorries after the war? It is a well-known fact that the wastage on motor vehicles is tremendous—far and away more serious than was ever supposed, not to mention the fact that many times the number ever contemplated as likely to be required are in actual use. Collisions, breakages, fires and what not have already produced many a valuable scrap heap, and if this turmoil continues for many months to come, as there is every prospect of it doing, there will be a big field for the bargain hunters ere long. It is a great pity that many of the damaged motor vehicles, the services of which have already been dispensed with by the Government, cannot be released at once, as with the dearth of materials for the manufacture of new vehicles, the prices which would be realised are, at the moment, likely to be greatly in excess of the figures they would fetch when times are more normal and "scrapped" vehicles easy to obtain. But the Government is too much involved in a much more important task for it to be expected that anything can be done for some time to come, notwithstanding the loss of several hundred thousands of pounds. One can, therefore, only conjure up in one's mind what a heap of treasure there is lying aside at the different bases, and how tempting it would be to many to pick out those vehicles which, after the necessary attention, are still capable of further service; for it must be remembered that the war has yet been much too short to wear out a first-class vehicle.

An index to the advertisements in this issue will be found on the page facing the back cover.

Motor Cyclist Volunteers on Active Service.

OUR gallant Italian Allies in their campaign against Germany and Austria are, needless to say, utilising motor traction and motor cycles on an extensive scale. In one particular direction, and that is the active utilisation of motor cyclist volunteers, they have gone a step further than the British authorities. Whilst the members of volunteer corps in various parts of England are spending their week-ends in training with little or no encouragement from the War Office, the Italian Government has sent at least one section of motor cyclist volunteers to the Front. Together with a corps of pedal cyclists, they numbered about 500, and great scenes of enthusiasm were witnessed in Milan when they left for the frontier last month.

The majority of the machines employed by the Italian motor cyclist volunteers are of British manufacture, but there are a few of Italian build. The entry of Italy into the war and the use of British motor cycles by the Government will mean fresh opportunities of demonstrating the reliability of the British machine, which already has gained an enviable name.

SCENES DURING TRAINING OF THE ITALIAN MOTOR CYCLIST VOLUNTEERS. A SECTION OF WHOM ARE NOW ON ACTIVE SERVICE.

Footboards v. Footrests.

I am rather surprised to see so many designers equipping their machines with footboards. To my mind the best sprung footboard, whatever its angles and insulation, cannot afford the same comfort as a couple of pairs of rigid footrests. They limit the legs to one position and to one angle, and the contact between their surfaces and one's boot sole is spasmodic. Two pairs of footrests give you something to push against when you brace yourself for a speed burst, and your boot sole swings round them, whereas it is jerked off a flat board. Last, but not least, when the long awaited tumble comes, you can kick the damaged footrests straight, supposing you have gone to earth with sufficient heaviness to kink them all; but if the machine had footboards, you can only heave the splintered relics over the fence, and wonder what you are to do with your feet till there is a chance to procure spares. However, others appear to differ on the point; and I notice that the *modèle de luxe* is generally equipped with boards.

A Novel Tyre Repair Kit.

Many tribulations have rendered me so expert with the standard tyre repair kits that I could almost mend a puncture with gum and postage stamp edging. So I invariably turn a rather glassy eye on any novel and sensational repair notions lest I should have to undergo a fresh novitiate under the new conditions. However, I plead guilty to a certain interest in a sample tube repaired under the "Mustikon" patents, which a friend showed me the other day. The puncture, it will be recalled from the description which appeared in *The Motor Cycle* of a fortnight ago, is enlarged a trifle, if necessary, and cut round, if its shape is irregular. Then a kind of glorified indiarubber collar stud is solutioned and inserted by stretching the tube, so that one boss of the stud is inside the tube and the other outside, the rubber of the tube being allowed to contract round the shank of the stud, which is of greater diameter than the puncture. This sample repair had been made without solution, and was airtight, so that I originally fancied I had hit on a design which eliminated messy and odorous solutions. I rejoiced greatly, for the modern solution is more volatile than its inferior predecessors, and is apt to dry up during the intervals between punctures. But I am informed that the studboss is meant to be solutioned to the tube, to resist the effects of friction against the cover. Even so, the patent is interesting; it should make a very strong job.

The Best Handle-bars.

I notice the trade seems to be settling down to a standardised type of handle-bar. A common type is fairly narrow, brought well back towards the saddle, upraised considerably to a point an inch or two behind the grips, and the tips carrying the actual grips are sharply dropped. The idea is that the rider can sit straight up, and that the grips then lie at the natural angle for his hands and wrists. Personally, I detest this type of bar. It is probably first-rate for sidecar work of the ordinary tourist variety, but it gives one comparatively poor steering control for fast work, and especially in fast cornering, for it tempts one to concentrate one's weight on the back wheel; above all, it creates the tendency to slouch. It fits you equally well whether you sit bolt upright, as if you had swallowed the poker, or whether you hutch yourself like a half-filled sack of flour, with an ugly backward hump in your spine. Purchasers should be careful to specify the type of handle-bar which they fancy. I plump every time for the wide medium dropped bar, which compels me to keep my backbone straight, which affords immense leverage for close steering and for correcting skids, and which keeps part of the weight of my body on the front wheel, and so eliminates the unspeakably perilous front wheel sideslip, alike on grease and in fine steering under emergencies.

Average Speed.

"Miles's" article in our issue of July 15th naturally attracted such a speed merchant as myself; and I feel I have a right to discuss it, because I habitually cover more than twenty miles in an hour, and yet, as I have ridden petrol vehicles for eighteen years and covered nearly a quarter of a million miles without one serious accident, I dare to call myself a safe man. "Miles" is perfectly right in recommending a light 5-6 h.p. twin for fast work, though he omits to mention that "light" 5-6 h.p. machines are few and far between, the weight of this class being much nearer 3 cwt. than 2 cwt. He goes on to say that the man who does over thirty-five miles in the hour is "some" rider, and that forty miles in the hour is practically beyond the compass of anybody but a fool who takes terrible risks. My own experience is that a 35 m.p.h. *average* is about the limit of safety for motor bicycles. But I am commenting on the article principally in order to introduce a point which I have not seen in print before, namely, that a fast car is safer at high averages than a fast bicycle—a point which some of our readers will not easily concede, and in which I disbelieved until a lurid member of our staff took me in hand. In the early morning I have done forty miles in the hour on motor cycles on several occasions; but I agree with "Miles" that it is risky, despite the ownership of a cycle which can touch 65 m.p.h., which probably accelerates faster than any car, and can certainly corner faster than any four-wheeler which is not skidded round every bend. The risk lies in the caution with which a two-wheeler must be decelerated. However powerful its brakes, it is dangerous to stop it so rapidly that a skid—wet or dry—may be provoked; and at "forty" averages occasional emergency brakings are inevitable.

Reliability, Simplicity, and Accessibility.

THEIR RELATIONSHIP AND A FEW SUGGESTIONS.

THE heading of these notes sums up the ideal after which all good designers strive, and which a large majority of motor cyclists earnestly desire. There is, however, a minority who clamour for increased power and speed, and this minority, combined with the advertising value of a win in a hill-climb or speed event, has somewhat blinded us to the chief importance of the motor cycle.

Undoubtedly, racing and hill-climbs have improved the motor cycle of a few years ago beyond all recognition; but the object of the motor cycle is to provide a cheap, simple, and reliable form of transit which the man in the street can own, ride, and understand with the minimum of trouble and the maximum of pleasure.

Now, the ordinary man does not require great speed. He would seldom touch 40 m.p.h. whatever the power of his machine, but he requires a vehicle which will average the legal limit, or a little over; in any circumstances, a machine which will carry him over any ordinary hill (not up Snowdon, or any silly freak climb) with absolute certainty, a machine which is flexible and easy to handle in traffic, and, above all, a machine which does not go wrong, or, if it does, is easy to put right. This brings us once again to the words of the heading, "Reliability, Simplicity, and Accessibility."

Reliability.

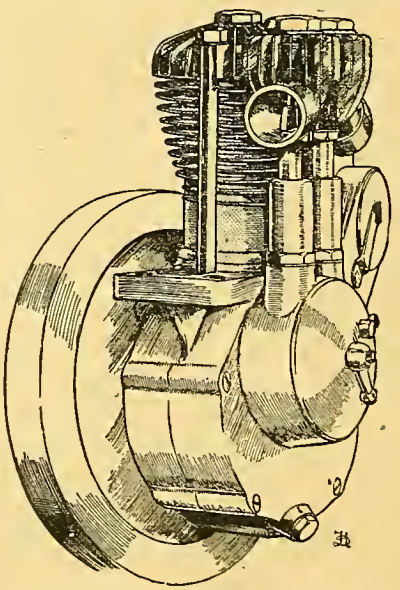
The word reliability in regard to motor cycles has developed a somewhat misleading significance, for one has come to look upon a machine as reliable, which is capable of withstanding a strenuous trial, possibly extending over six days, and climbing freak gradients without mechanical breakdown. A machine which fulfils these conditions may or may not be reliable. It may be in perfect condition and ready to do the same trip all over again, or it may be absolutely "all in" and require serious tuning up or even internal repair before it is capable of further serious touring.

Reliability should include freedom from wear and petty attention as well as freedom from mechanical failure on the road. Therefore, it may be wise to sacrifice a small amount of mechanical efficiency and specialise on large wearing surfaces, efficient lubrication, the exclusion of mud, dust, water, etc.

It is well to remember that the replacing of a worn part generally costs as much as a good many gallons of fuel, so that an increase of durability will more than counterbalance a slight decrease in mechanical efficiency due to high compression, speed cams, etc., especially as replacements only too often mean delay and perhaps a week off the road. It is too often the case that the failure of one small part may mean the replacement of several.

Simplicity.

In nine cases out of ten simplicity and reliability go hand in hand. The fewer the parts (in reason) the less there is to look after, and the fewer the parts liable to wear out, provided the wearing surfaces are well up to the work intended for them. There is such a thing as dangerous simplicity, which is generally synonymous with bad design, for to make one part do the work usually allotted to two or more parts sometimes introduces further and less obvious complications.



Complete engine, as suggested in article.

Take an instance in which reliability and simplicity are a matter of compromise. The writer is one of those who maintain that perfect reliability cannot be obtained without some form of mechanical lubrication, and yet mechanical lubrication necessitates a mechanical pump, and the pump will require some form of drive, thus adding materially to the number of parts. The writer believes that mechanical lubrication is at least as essential to reliability as a magneto, but being (though firmly convinced on the point) one of a small minority, he proposes to leave this subject alone for the time being.

Simplicity should not be confined to the engine alone, but should extend to gears, transmission, frame, and fittings—especially to fittings which require much more attention than they generally receive. Take, for example, lamp brackets and horn clips. Manufacturers of these accessories are forced to supply fittings (usually clips) suitable for attachment to various parts of any machine, with the result that they are often flimsy, awkward to get at, and nearly always dust traps. Machines should be designed with special provision for such fittings, so that one or two sensible sized nuts should be capable of holding them firmly and neatly on their proper lugs. Here we come up against the difficulty of specially made accessories for special machines, but this has nothing to do with simplicity.

Accessibility.

Accessibility and simplicity usually go together, but accessibility and reliability frequently lead to a compromise, and it is sometimes difficult to be certain how much one may be sacrificed to the other. This is the point where the experience and judgment of the designer are chiefly to be recognised, and there is a large divergence of opinions on the subject.

Sometimes accessibility has to be sacrificed on the score of manufacturing difficulties or expense, but always the term accessibility should include ease of dismantling at home for repairs or cleaning, just as much as accessibility for small adjustments on the road.

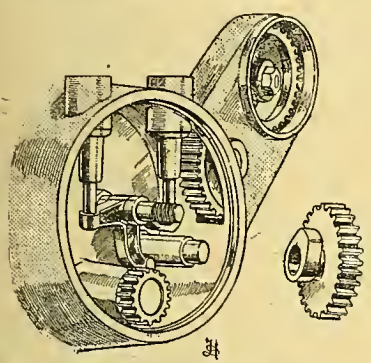
The following notes have been compiled as a result of considerable experience on the road and in the shops, with the idea of suggesting a few desirable features, but as they are purely expressions of personal opinion they must be taken for what they are worth. Some of the ideas are not original, but are in use on certain machines at the present time. As far as possible, the notions have been made applicable to any type of machine, though the engine details are suitable only for single-cylinders.

Engine Details.

The writer has no idea of setting forth to explain the merits of "an ideal motor cycle," but merely to outline a few possible refinements on a plain straightforward machine. The sketches show an engine with an outside flywheel, because this happens to be his personal ideal, but most of the features are equally applicable to the more usual type.

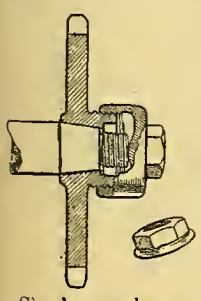
Firstly, with regard to the cylinder, the detachable head type offers so many advantages from the point of view of accessibility that it is obviously desirable. This design has other advantages which are not so obvious, and which need not be mentioned here, and its one disadvan-

Reliability, Simplicity, and Accessibility.— tage (that of leakage at the joint) is so easily obviated by proper constructional process that it may be ruled out. The head may be detached with comparative ease for cleaning purposes or valve grinding, and the carbon deposit can be quickly removed from spots which would otherwise be inaccessible. There are various methods of holding the head in place, of which the A.J.S. crossbar with two long bolts is the most simple, though the three and four bolt principle, as used in American designs and in the case of the Blackburne, is, if possible, more effective for large bore engines. The long bolts should be made to swing at their lower points of attachment, and the lugs in the head slotted so that the head may be easily removed without being lifted unduly high. The cam gear for a single-cylinder engine may be arranged in a number of simple ways, and one of the most satisfactory methods from a



A possible form of single cam timing gear described in the accompanying letterpress.

touring point of view is that illustrated, which is typical of the 1915 Premier and all Blackburne models. Here one cam only is used, and lies directly below one of the tappets (either tappet is suitable, provided the design is arranged to correspond). Both tappets are operated through rockers, one being of the "bell crank" variety. These rockers must be correctly profiled to give a longer lift to the exhaust valve than to the inlet valve and may be carried on a common pivot, which may with careful design also act as a holding down bolt for the circular timing case cover. The combined cam and gear wheel may be mounted so as to rotate on a large diameter fixed spindle, which is hollow and drilled in such a manner as to supply oil from the crank case direct to the bearing surface.



Simple sprocket or gear wheel remover.

Magneto Drive.

A gear drive for the magneto has many advantages over a chain drive, as, should the valve gear need inspection, it is not necessary to remove first of all the sprockets and chain cover, which is both a tiresome and messy job, and necessitates retiming the magneto. In the design sketched herewith it is only necessary to remove a single large nut or wing bolt to free the circular recessed timing cover, and there is no need to disturb the magneto timing. The magneto may be mounted either in front of or behind the cylinder as preferred, and a single wheel between the camshaft and magneto is all that is required.

If, as is intended, the magneto drive cover is cast with the timing case, the fixing for this intermediate wheel requires a little ingenuity, but it can be done satisfactorily, and once in position need never be disturbed.

Opposite the gear on the magneto-shaft should be an inspection cap large enough to permit the withdrawal of the gear, and the gear should be fitted with a withdraw nut, such as that used on the Abingdon, Triumph, etc.

Enclosed Valves.

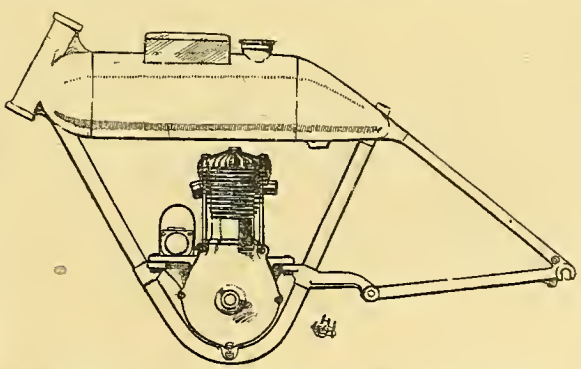
The next suggestion shows a method of enclosing the valve tappet without causing inaccessibility, but it may here be said that this device is only applicable to engines with a good space between the valve chest and timing cover. The idea is clearly shown in the part sectional sketch, which shows a metal case sliding on an extension of the valve guide. The lower end of the case is made to screw on to the outside of the tappet guide, and as the upper end of the spring takes off from the inside of the case, the spring is held at its normal compression. Thus the tappet gear is enclosed and the spring held well away from the cylinder heat, and if a fibre washer be placed round the tappet guide oil cannot leak out or dust work in. On unscrewing the case the spring compression is released, and the valve cotter can be removed with the fingers.

Diagram of enclosed valve device, showing cover free and no compression on valve spring.

Engine Fixings.

Engine fixings are, of course, largely dependent on frame design, and the type of fixing which the writer prefers on the score of accessibility and simplicity practically necessitates a loop frame (which in itself is a very desirable point). The fixing consists of platforms cast with the crank case and resting on corresponding platforms on the frame. One of these platforms may conveniently carry the magneto, and a locating and steadying flange may be arranged on the crank case. This practice is common in America, but is confined to a very few makes in this country. The Clyno two-stroke is an excellent example. The Arno attains the same end without the use of a loop frame. One of the chief advantages of this type of fixing is the ease with which it is possible to remove the engine unit from the frame without springing the frame or feeling for bolt holes which cannot be seen. Another item in its favour (especially in conjunction with a loop frame) is the fact that the bolts which hold the two halves of the crank case together carry no strain, and can consequently be replaced by comparatively light screws with countersunk screw heads to replace the nuts. This obviates ugly dirt collecting bosses and nuts.

One other important detail in connection with the crank case deserves attention. The drain plug (ordinary taps are no good) should be of large diameter, and so placed that it *does* drain the crank case, and yet is reasonably accessible.



Suggested frame and tank construction. Observe unusual engine fixings.

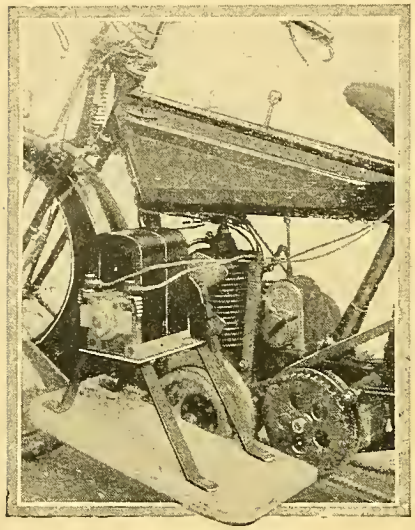
A Plea for Outside Flywheels.

Before leaving the engine, the writer would like to put in a plea for outside flywheels under all the three headings of this article. Nothing could be more simple and reliable than a properly designed one-piece crankshaft and single flywheel. There are not two flywheels to get out of truth and cause vibration and loss of power, or to be erected out of truth, which is a very common fault even on quite good makes of engine. The big end bearing gets *some* chance of being lubricated (even with splash lubrication) when it is not protected from oil by a flywheel rim fitting closely round it on either side, or by the action of centrifugal force, which tends to keep the oil or oil-filled vapour away from it. It is not necessary to remove one side of the crankshaft to take up the big end bearing in case of wear, and the big end, being necessarily of the split type, is adjustable, and is accessible in the case of wear. One very important feature must, however, be remembered in designing a split big end bearing. Large diameter special steel bolts *must* be used, or trouble will occur due to bolt stretch. Many cases of so-called "big end wear" have occurred recently on small solid crankshaft engines, and in nine cases out of ten no undue wear has taken place, but the slackness is due to the stretch of the bolts which secure the cap to the rod.

(To be concluded.)

AN ELECTRICALLY-EQUIPPED TWO-STROKE.

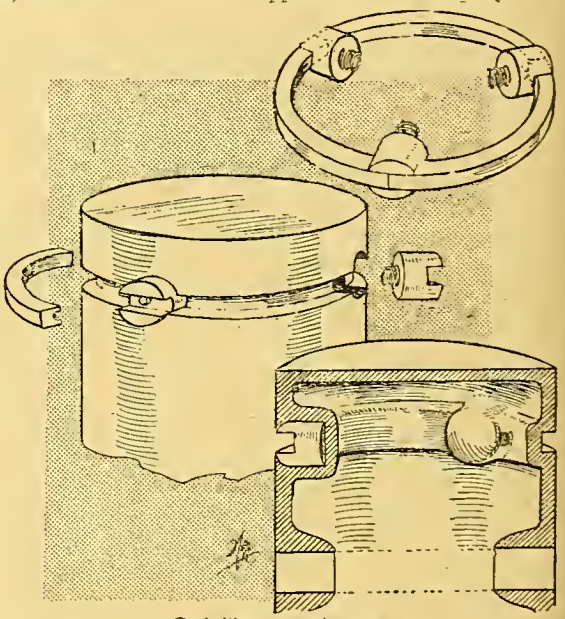
AN Allon two-stroke motor bicycle, recently made to the order of Sir Henry Norman, Bt., M.P., who is a member of the R.A.C. Committee for the War Office, contains some novel features. The machine is equipped with a permanent magnet Mira dynamo generating 120 watts (10 ampères at 12 volts), by means of which a small searchlight, an X-ray set, or a signalling apparatus can be worked. The electrical equipment has been carried out by the High Tension Co., 62, Belvedere Road, Westminster, S.W. The engine is provided with a fan fixed to the end of the dynamo shaft, so as to create a draught on the cylinder when the machine is running on the stand. The Whittle belt-driven dynamo can be quickly slipped off when it is desired to run the machine on the road, a notch in the pulley being provided to facilitate this operation.



Allon machine with Mira dynamo tor supplying current for small searchlight, X-ray set, or signalling apparatus. The batteries are carried in a special box on the carrier.

A NOVEL PISTON RING.

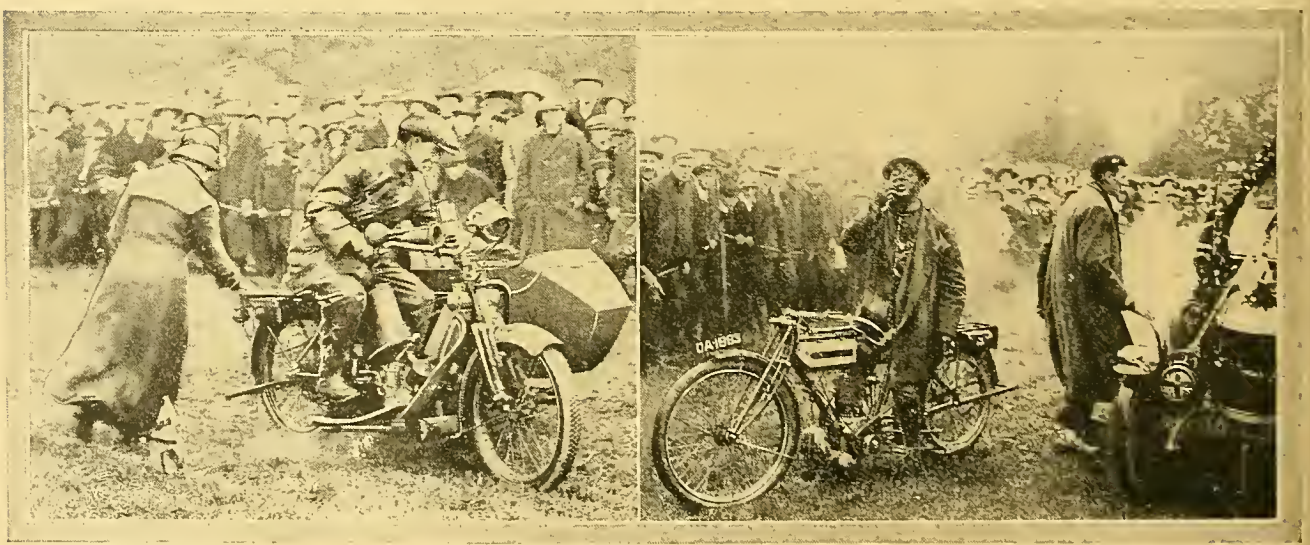
WE have received particulars of a novel piston ring, the invention of Mr. T. Gaskell, 66, Portland Place, North Stockwell, S.W. From the accompanying sketch it will be noticed that the ring is divided into three segments, the joints occurring in a slot cut in one of the three plungers with which the piston is provided. Behind each plunger there is a spring tempered so as to stand the necessary heat. It will be further noticed that in the sketch of the piston, the plunger facing the reader is provided with a peg, the object of which is to prevent the ring from turning. The result is what is claimed to be a practically unwearable piston ring. It has great depth, is always kept up well against its work by means of the springs, the compression cannot leak past it, and it is easy and not expensive to manufacture. Moreover, it possesses the advantage of the piston only needing one ring to keep perfect compression, with the result that less friction and consequently greater efficiency are obtained. The device, though it has not yet been tried on motor cycles and cars, has been used with considerable success in gas engines and air compressors, and we look forward to hearing more about it at no very distant date.



Gaskell's patent piston ring.

EXPORT OF TYRES.

THE Dunlop Rubber Co. write that attempts are being made to purchase motor tyres from the trade in small quantities for export, and they point out that all their tyres are sold on the condition that they are not re-sold for export, except when fitted to cars. Moreover, apart from the foregoing, which is a condition applicable to Dunlop tyres in normal times, a Government prohibition exists against the export of pneumatic tyres, and persons who make themselves in any way parties to the evasion of this prohibition incur serious penalties.



Motor cycle scenes in the gymkhana, which formed part of the Bank Holiday gala programme, in aid of the British Red Cross Wounded Soldiers' Home at Erdington, Birmingham. (Left) A Scott rider in the musical chairs event. (Right) Rider of a T.T. Triumph devouring a bun at T.T. speed in the mystery race. The weather was most unfavourable.

DOES AN ENGINE RUN BETTER AT DUSK?

Some Mixed Opinions on a very old Topic.

THIS question which we have revived in our columns is by no means a new one. Some people think the whole idea is based upon misconception, others are confident that the answer should be in the affirmative, but so far as we are aware no universally accepted solution of the phenomenon has been put forward. Some writers, again, treat the matter in a frankly humorous manner, others with an entire absence of that desirable quality. It is by no means inconceivable that a damp atmosphere should have some effect upon carburation, and also in consequence of the moisture, which enters the engine with the mixture, some effect also upon cooling, the results of which might be beneficial. Some light may possibly be thrown on the subject, but in the meantime we advise our readers not to take all the suggestions and statements made by our readers too seriously. "Y 2895" will be amused to know that his remarks have been taken seriously by some correspondents.

Sir,—Referring to "Y 2895's" letter on the above subject, I completely fail to see how the rotation of the earth about its axis can possibly alter the level of a road. A road which is level at noon must be level at dusk, or on any other time. Let us suppose for the sake of argument that the road which is level at noon does slope at an angle of about 45° at dusk, what will happen at midnight? Will things begin to fall off the earth? That is what one would naturally expect. How is it that the rivers do not run dry during the night? Their beds must be practically level at dusk as well as at noon, but, according to your correspondent, the bed should begin to slope at about 45° by the evening.

My experience has been that a machine will run much better at dusk in either direction than it will at noon; but if the road were to assume a slope in the evening the machine would certainly run extremely well down the slope, but I am afraid there would be very great trouble in getting the machine to go up the slope of 45°. No! the roads do *not* slope at dusk; *once* level, *always* level.

As regards plugging up the exhaust pipes, well, it needs no comment; the suggestion is ridiculous on the face of it.

G.W.P.

Sir,—The letter from "Y 2895" has made my head ache. I have forgotten all my spherical trigonometry. Is he sure about the angle being 45°? Now I have my own theory, which is this: All day long the magneto is pumping up alternating current electricity, and by dusk, of course, the whole machine is full of it—tubes, tank, and crank case; it cannot get to earth on account of rubber tyres insulating the machine. Now this current, all stored up, repels the electricity in the earth, and tends to lift the machine off the road; in fact, you might call it a repulsion motor. The copper losses can soon be reckoned up; thus tuppence to the ostler at the Blue Pig, tuppence to the waitress at the teashop, and so on. Now if "G.P.G.K." wants to test this theory, let him trail an earthing plate behind him—a good heavy copper plate with about two yards of flexible cable will answer—and all the current will run to earth after firing the engine. I am sure he will find that the machine no longer runs better at dusk.

G. PINKER.

Sir,—I think it is obvious that "Y 2895" is wrong in his theory of the earth's rotation having an effect on the running of a motor cycle at dusk. If a road is level at noon, it can never attain an angle of 45°, but 23½° is the maximum slope it can have, that angle being the same as the angle of inclination of the earth's axis. If at dusk a road did slope downwards, enabling "the machine to travel at a tremendous speed," what if you were travelling the other way? A "konk out," I presume! Surely a road cannot slope in two opposite directions at the same time, nor would it kindly alter the direction of its slope to accommodate the riders thereon.

Besides these inaccuracies, "Y 2895" has evidently never learnt that the force of gravity is always exerted towards the centre of the earth, so that roads, etc., never alter their slope with regard to gravity, or else how would houses and their occupants fare if roads were alternately level and tilted up to 45°? The rotation of the earth, of course, has no effect on making a road either uphill or down.

Personally, I am satisfied with the explanation put forward by "G.P.G.K." I think the reason why engines do not start away easily in the morning is because of the low temperature of the air, and certainly not because all roads slope upwards.

BISCUITS.

Sir,—With reference to the solution of "Does an engine run better at dusk?" "Y 2895's" attempt having been puerile, will someone else explain this curious fact?

G.P.G.K.

Sir,—In your issue of July 22nd this oft-debated question is again asked, and it is suggested that the running of an engine might be improved by carbonic acid gas.

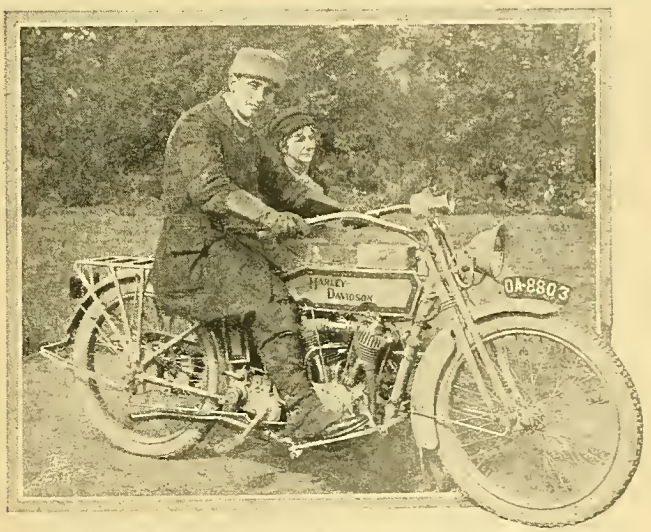
I think that an engine does run better in the evening, but I think that the explanation is to be found in the more uniform density of the air as the sun loses its power.

In the daytime an engine is running through layers of air of ever varying density; consequently each successive "suck" of the engine takes in a varying quantity of oxygen, and the impulses become now stronger, now weaker. As the air becomes of more uniform density, each "suck" of the piston takes in the same quantity of air, and the impulses become more regular.

I once saw it suggested in a motor paper that an engine ran better in mist. I have not observed this myself (most of us would throttle down in a mist to a mere crawl), but if so, the more uniform density of the air is probably the reason.

In one of the admirable novels of Capitaine Danrit—I think it is called "L'Aviateur du Pacifique," but I have not the book by me—the author, in describing the passage of an aeroplane over the ocean, speaks of "the well-known improvement in carburation towards evening." It would be interesting to know whether this is really the case in sea flying, for the improvement in uniform density would be very much less marked over the sea than over the land, if, indeed, it occurs at all.

C. M. STUART.



Albert Wilkes, the famous half-back of Aston Villa, and his electrically-equipped Harley-Davidson, with which he is greatly pleased. Mrs. Wilkes occupies the sidecar.

ROAD TESTS OF NEW MODELS.

3½ h.p. SUNBEAM WITH SIDECAR.

Engine 85 x 88 mm. bore and stroke (499 c.c.) Three-speed countershaft gear and all-enclosed chain drive. Multiple plate clutch. Gear ratios (with sidecar) 5¼, 8¼, and 14¼ to 1.

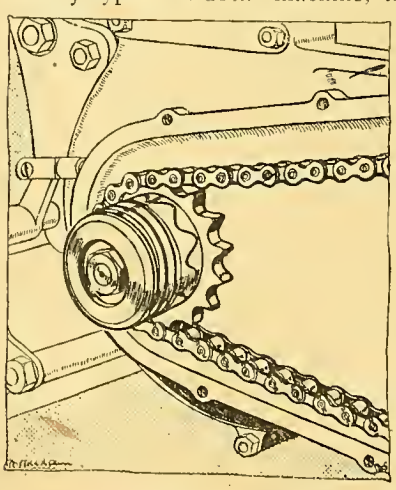
IN spite of the well-established popularity of the big twin sidecar outfit, there is no doubt that the 3½ h.p. touring single with light sidecar attachment will continue to meet an immense demand. This class of machine appeals not only to the man of limited means—the small tradesman and others, to whom the luxurious twin is somewhat out of reach—but equally to the man who does not desire his sidecar as a permanent fixture, his use for it being only occasional.

Recently one of our contributors has had the opportunity, through the courtesy of the makers, of putting a 3½ h.p. three-speed Sunbeam to a somewhat exhaustive test among the hills of West Yorkshire, his object being to test to the limit the machine's abilities when it came to really trying conditions with sidecar attached. The roads chosen, therefore, were the worst that could be found, and the manner in which the steady throb of the engine kept the back wheel spinning on gradients resembling the roof of a house was somewhat of a revelation. There is no doubt that this machine is built on the right lines for the double purpose mount so greatly in demand.

When riding solo we found that the low gear is never required. The machine picks up on the clutch and negotiates the worst of hills on middle. With sidecar attached, however, it is occasionally necessary to resort to bottom, and with the engine steadily pulsing the machine will take its double load anywhere that the wheels can grip.

A Severe Test.

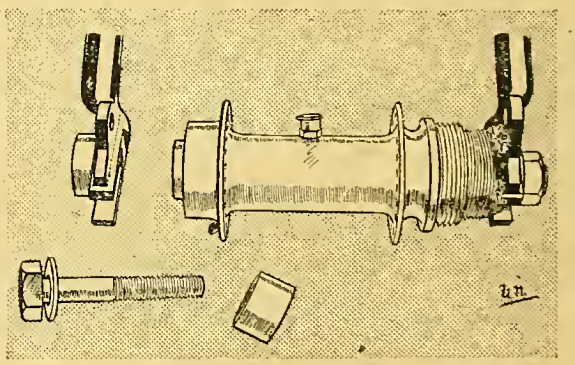
Probably the worst hill we negotiated with sidecar and a ten stone passenger was Park Rash, which is considered the worst public road hill in England. The ascent of this hill is really a creditable performance for any type of sidecar machine, the gradient at one point of the first bend being reputed to equal 1 in 2.8, while a thick layer of loose stones covers the track. The first attempt we made failed from bad driving, the machine coming to a standstill with the rear wheel spinning merrily. On the next occasion, however, a good speed was maintained throughout the climb, the engine pulling evenly and without a suggestion of "konk." Later in the day an equally successful ascent of the Scar, at the head of Nidder Dale, was made. No preliminary tuning had taken place, the machine being a standard model, and we had covered 180 miles on the previous day.



Spring drive fitted to main engine shaft on the 3½ h.p. Sunbeam.

It is safe to assume, therefore, that the rider of average ability is not likely to fail on anything he may attempt with passenger and sidecar with a machine of this type, for such hills as Park Rash are never negotiated in the ordinary sense of touring. The low gear on the 3½ h.p. Sunbeam is merely an emergency provision, which gives one a sense of security when travelling in mountainous districts, but which is seldom called into use.

As regards speed, the machine we rode could comfortably hold its own on anything resembling a level road with a 5-6 h.p. twin, though the latter, of course, obtained a considerable advantage on long up gradients. Riding solo, we could attain a speed of well over 50 m.p.h. on deserted favourable stretches. The petrol consumption was quite an agreeable surprise, for we certainly expected the energetic kick of the engine to touch our pockets when it came to footing the petrol bill. Travelling between Wolverhampton and Bradford, however, *via* Uttoxeter, Buxton, and Glossop, the consumption worked out at 87 m.p.g. riding solo. but with neither wind nor road surface in our favour. It is doubtful whether the attachment of a sidecar would make a difference of more than 8-10 m.p.g.



The Sunbeam divided back axle, which allows of the rear tyre and inner tube being withdrawn without disturbing the wheel.

The machine was pleasing to handle—particularly at low speeds. The engine would throttle down to the merest tick on high gear, and the hand-controlled clutch, could be used to ease the situation when negotiating traffic at very low speeds. Thus one can thread one's way through the most crowded thoroughfare with the engine running silently and the clutch slightly eased, the judicious handling of the clutch lever and the throttle control enabling one to pick up quickly without noise and fuss.

Where lightweight riders agree.

Whatever differences of opinion they may have regarding engines, carburetters, and so on, lightweight riders agree completely upon the matter of saddles.

They all realise the vital necessity for a seat that will give the same luxurious ease as is enjoyed by riders of the heavier mounts, but in a lighter and more compact form.

To meet this need we have produced our B150 model, which is constructed with all the care and skill that have made our model B170 famous wherever motor cycles are ridden.

We do not hesitate to say that there is no lightweight saddle made that can compare for comfort and quality with

BROOKS B150.

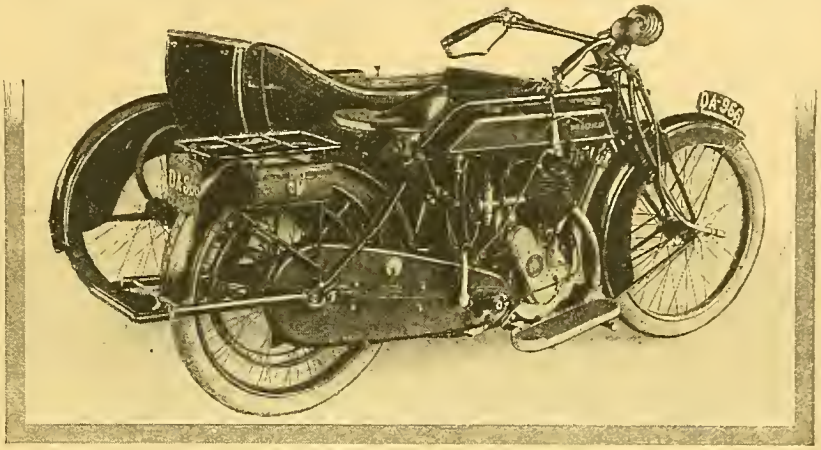
Road Tests of New Models.—

Mechanical Features.

In connection with this slow running, the ingenious thrust absorbing device on the engine sprocket is worthy of mention, for not the slightest suggestion of snag was perceptible at low speeds. The device consists of two deep-toothed ratchets on the engine-shaft, which are held engaged by a strong coil spring. Each thrust of the engine tends to cause these ratchets partly to disengage against the pressure of the spring, and thus a perfect cushion drive is given, though no slip or loss of power occurs. Upon the efficiency of this device, which is carefully set by the testers, and thereafter requires no further attention, depends not only the comfort of the rider, but the life of his rear tyre and the whole transmission system.

The clutch, which is of the multi-disc pattern and of large size, can easily be adjusted to suit one's tastes, while it is only ten minutes' work to take out the plates for a periodical cleaning.

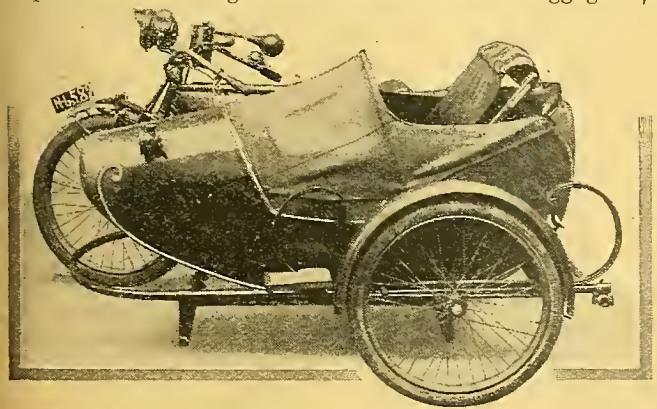
While the machine was in our possession, it became necessary to change the rear cover, and it was relieving to be able to perform this tedious undertaking without removing the wheel—a messy and irritating performance when an enclosed chain drive is involved. All things considered, the machine appealed to us as an excellent mount for real hard work of any kind, and it fully meets the demands of the rider who desires to climb "anything" without loss of dignity, and, when occasion demands, without shedding the fair one.



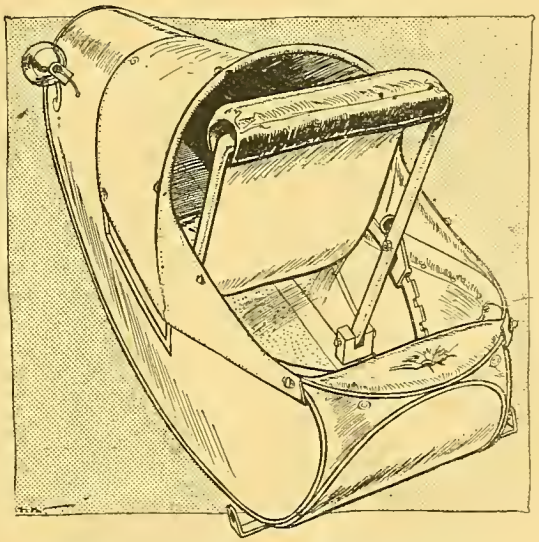
The standard 1915 3½ h.p. Sunbeam passenger outfit.

An Adjustable-seated Sidecar.

WE recently had the opportunity of inspecting a new sidecar body, the invention of Mr. B. Graham Wood, the chief novelty of which is an adjustable seat on the deck chair principle. The accompanying sketch clearly shows the method of operation. The frame which carries the back is hinged at the bottom and held in the desired position by a rack on each side. The hammock part of the seat is padded at each end and spring supported; this does away with a sharp ridge which might otherwise be uncomfortably evident where the canvas part is attached to the frame. The seat can be removed in a moment when the whole of the roomy sidecar is available for goods. If the seat is adjusted in a forward position a child's seat can easily be accommodated behind it, and the space beneath the seat is capable of containing a considerable amount of luggage and spares. A large storm apron is fitted attached to a bent rod and quickly removable; a small box is placed in the rear suitable for the tool roll and spare tube, and the construction is such that the body should be light in weight as well as very roomy and comfortable. Mr. Wood assured us that he slept in the sidecar several nights when on a camping holiday. The design has been submitted to a large firm of sidecar manufacturers, and it is not unlikely that this sidecar may ere long be offered to the public.



A new sidecar, the feature of which is the adjustable seat made on the deck chair principle.



Sketch showing rack and notches allowing seat to be adjusted on the Wood sidecar.

"THE MOTOR CYCLE" RECRUITING SECTION.

Last Week's Record Number of Recruits. More Motor Cyclists Wanted.

THE training of suitable cyclists of good physique at the Excelsior motor cycle works has now commenced. By the special consent of Lieut.-Colonel Bradley, Commanding Officer of the M.M.G.S., men who are passed by Mr. Geoffrey Smith to undergo training at the Excelsior works, under Mr. W. H. Carson's supervision, will receive a messing allowance of 1s. 9d. per day in addition to their ordinary pay.

As a result of calls from the Royal Engineers headquarters, the waiting list for despatch riders has now sunk to a low margin, and motor cyclists of long experience who are able to perform all ordinary running repairs are now invited to undergo test to be placed on the waiting list. Particulars of enlistment may be obtained on application to Mr. Geoffrey Smith, editor of *The Motor Cycle*, 19, Hertford Street, Coventry, and applicants for positions as despatch riders should clearly state at the head of the letter the section they desire to join.

Recruits continue to come up very satisfactorily for the new batteries now being formed in connection with the M.M.G.S. Last week's inspection produced a record number of candidates, over ninety presenting themselves for enlistment, though a number were weeded out by the doctor, and one or two others were rejected for various reasons. The list at the bottom of the page gives the successful applicants for service.

Trooper A. R. Sharpe, of the Surma Valley Light Horse, who is coming home from Cachar, India, to enlist in the M.M.G.S. As we have already remarked, the number of men coming from various and outlying parts of Greater Britain to serve their country is remarkable.

Still more men are required, and applications are invited on the form attached. Men of suitable qualifications who state that they are at liberty at once will receive a free railway warrant to attend the next inspection at the Recruiting Office, Little Park Street, Coventry, on Wednesday afternoon next, the 18th inst.

Several Scotsmen were included among last week's batch of recruits, whilst other men came from all over England and Wales.

A number of men offer their services a month in advance, but this is unwise, as with the huge number of applications which have to be dealt with one or other may be overlooked.

Two of the men accepted last week came from South Africa, where they have already seen service under General Botha. One of them, H. Pattison, is a native of Coventry, and went out to Kimberley a couple of years ago. His companion, R. V. Edouard, is a South African. A number of men from Greater Britain have already enlisted in the M.M.G.S., but we believe this is the first instance of men coming forward who have already had a taste of the present war. Their keenness and patriotism are splendid. It is interesting to note that these two patriots saw the announcement in *The Motor Cycle* whilst in Capetown, and promptly started for England.

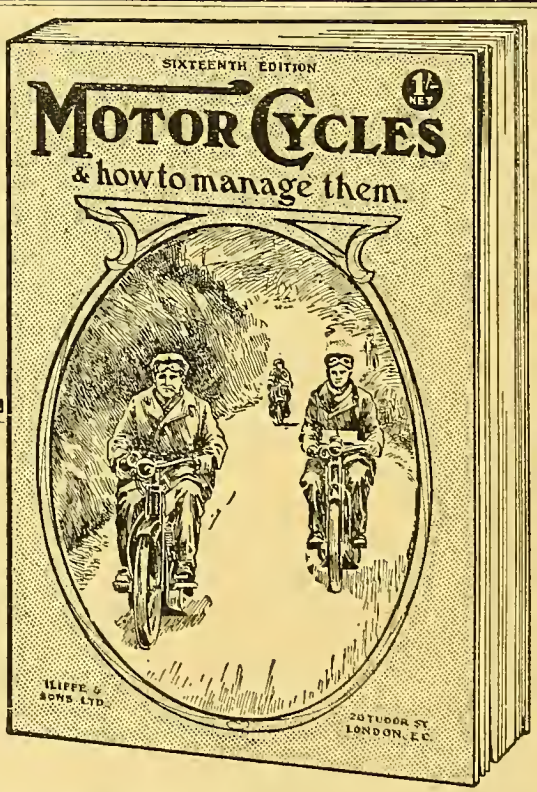
To enjoy motor cycling *thoroughly* you must understand your machine *thoroughly*



Get the **16th Edition** (Revised) *of this useful book*

"MOTOR CYCLES & HOW TO MANAGE THEM" —the standard handbook for motor cyclists—will tell you practically all you want to know about your machine.

¶ There is no doubt as to the supremacy of this book over all others of a similar kind. It is constantly being checked and revised by the staff of "The Motor Cycle," and consequently carries the weight and authority of this journal.

¶ Its contents embrace a multitude of subjects relating to motor cycles, their care and management. It is clearly written and well illustrated. Every motor cyclist—whether beginner or experienced rider—should keep a copy handy for reference.

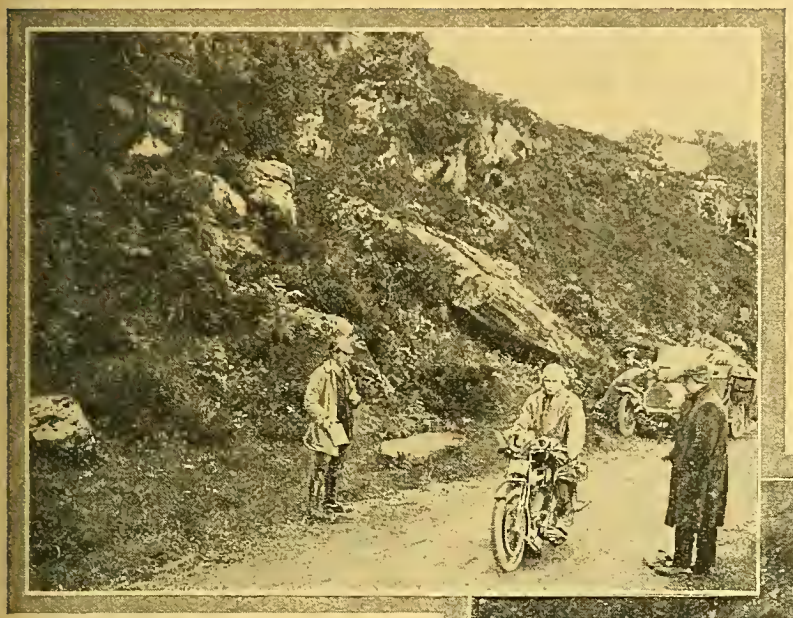
Cork One-day Trial Awards.



THE following are the awards in the one-day trial of the Cork and District Motor Cycle Club on the August Bank Holiday, which was reported on page 137 of our last issue.

First-class awards were won by:

R. S. Russell (2¾ Douglas), figure of merit 5.11.

E. G. Jack (3½ Rover), figure of merit 5.01.

F. L. Dooly (4¼ B.S.A.), figure of merit 5.00.

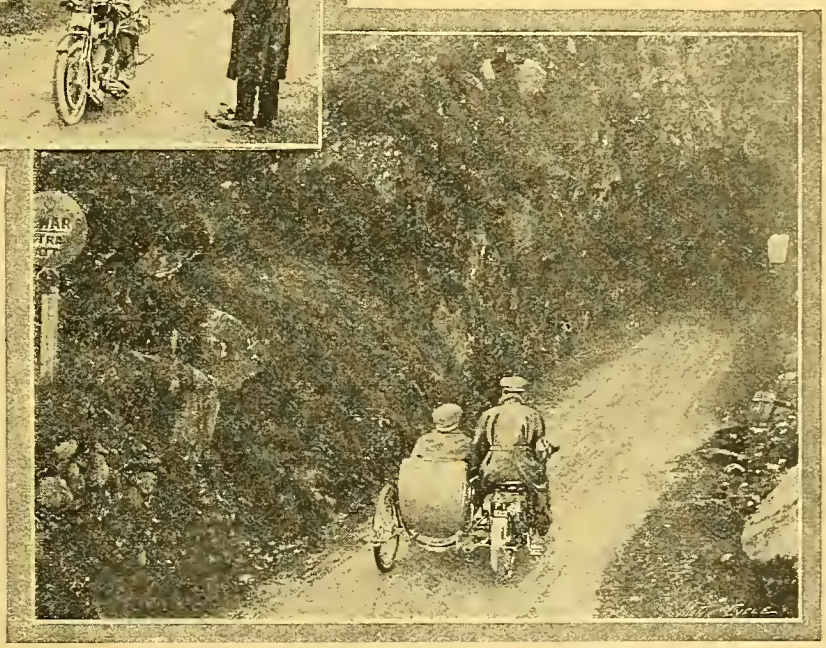
E. W. Whitaker (4¼ B.S.A.), figure of merit 4.50.

D. Lucy (2¾ Douglas), figure of merit 4.09.

Second-class awards were won by: J. Hennessy (5 Indian), G. Pring (4 A.J.S. sc.), J. Cross (6 Enfield sc.); third-class by R. Swanton (3½ Indian), C. W. Ryan (3½ Indian), Sergt. Hughes (2¾ Douglas), Lance-corpl. Thompson (4¼ B.S.A.).

Russell had the best figure of merit in the flexibility test, and consequently holds the Hugh Gibson cup for one year. The team prize was won by the trio consisting of Russell (Douglas), Dooly (B.S.A.), and Whitaker (B.S.A.), each of whom secured five marks

On Ballaghosheen Pass, Swanton and Hughes failed, and on Sheedy Mountain, Ryan, Pring, Musgrave, and Cross failed. No sidecar machine made a clean ascent of the last named hill, but the fact that it was climbed by the official observer, Mr. Lister, on a 6 h.p. A.J.S. with sidecar indicates that it is not an impossible hill.



CORK AND DISTRICT M.C.C. ONE DAY TRIAL.
(Reported on page 137 of our last issue.)

(Upper) E. W. Whitaker (4¼ h.p. B.S.A.) in the slow test. He covered 110 yards in sixty-two seconds.

(Lower) W. P. Musgrave (4 h.p. Triumph and sidecar) entering the tunnel under the mountains that divide Cork and Kerry on the Glengarriff to Kenmore road.

MIDLAND MOTOR CYCLISTS' VOLUNTEER CORPS FIELD DAY.

ON Sunday last the corps paraded on the Coventry Road for a reconnaissance. The elementary stage of the corps training has now been completed, and the more difficult courses commenced. Sunday proved to the men that all their past experiences have to be brought in even to get through one section of the opposing screen.

Commandant Silver split the corps up into patrols, each patrol working on its own initiative. This meant that each man had to bring in an accurate report—that is if he succeeded in getting through.

The opposing force was represented by a skeleton army, consisting of some of the fastest men. Each of these men carried different coloured flags, representing artillery, cavalry, and infantry.

The patrols, proceeding *viâ* Maxstoke, took advantage of the old ruins as an observation post. From here were detected a force of infantry holding the roads at each fork. Further reconnaissance was made, and it was found that the infantry was supported by artillery posted on the surrounding ridges, the batteries being supported by cavalry. Large sketches were made, and a report made out on the various positions held.

The bearings and altitudes were taken, and in the report was included a chart showing the accommodation for troops.

Difficulty was now experienced by the patrols in gettting through the enemy's line, and it was found that practically only one road, and that a byway, was open. A patrol under T. Officer Egginton was detailed off to make the attempt.

Another patrol broke through the first line and got on to the Coleshill-Atherstone Road. Further on the patrol ran into an ambush of cavalry, and was cut off. On the roll being called it was found that very few had got through, but all the men had brought in good reports.

ROAD REPORTS.

BAD STRETCHES NOTIFIED BY READERS.

SINCE the publication, on page 114 of our issue of July 29th, of bad stretches of road that it is advisable, if possible, to avoid, we have had many more communications from readers on the same subject. The result is that we are now enabled to give a second instalment of road reports in different parts of the country, and we have to thank our correspondents for the information supplied.

KENT.—We have received information of the bad condition of the road between New Inn Green and Newington, on the Ashford-Folkestone road. The Hythe-Sandgate road is reported to be full of pot-holes. The road from Hythe to Folkestone is in very bad condition. In Hythe itself there are some very bad turnings, and the streets are very narrow, while motor 'buses practically prevent any passing. The road is also bad between Green Street Green and Knockholt on the Sevenoaks-Bromley road. This is made worse by a high hedge which conceals the road.

LINCOLNSHIRE: NEW HOLLAND-GRIMSBY - LOUTH - MABLETHORPE - SLEAFORD - LINCOLN - BOURNE.—All the principal roads of this county are in first-class condition. In the above districts no trouble whatever is experienced with military patrols, and there are apparently few restrictions, if any.

THE GREAT NORTH ROAD: LONDON-STILTON - GRANTHAM - DONCASTER - HARROGATE.—This main highway is now in excellent condition from London to Doncaster (166 miles), with the exception of portions between Alconbury and Stamford, which are only moderate. Again, the stretch from Doncaster *via* Wetherby to Harrogate is in fairly good condition. The Harrogate-York road is also in excellent condition; this remark applies as well to the York-Market Weighton-Hull road.

DEVONSHIRE.—The main road between Bideford and Clovelly is in a disgraceful state—so bad that it is not recommended to be traversed at all. The avoiding road going from Barnstaple is to cross the bridge at Bideford, turn sharp left, and follow the river to Sandcross, and then go from Packham, turning to the right by the schools, keeping straight on over the next cross roads, and then take the next turning to the right, leading into the main road, about 200 yards from the turning to Clovelly. The main road is being repaired, but the repairs are not progressing very rapidly.

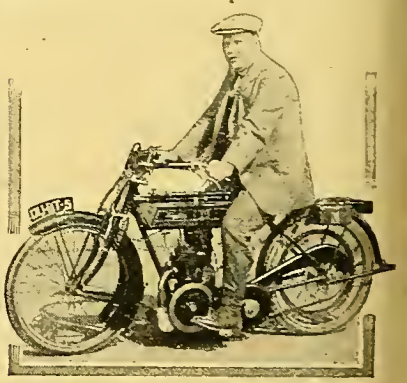
SOMERSET.—The Bridgwater-Minehead road is not very good.

SUFFOLK.—The road from Ipswich to Felixstowe is in good condition.

ESSEX.—The main London-Colchester road is in a very fine condition, and only occasional bumpy patches are encountered. The secondary roads, such as from Chelmsford to Tollesbury, Burnham, Maldon, etc., are quite good, and tarred through the larger villages. We suggest to motorists on their way to Colchester, etc., when passing through Chelmsford to take the road on the left at the parting. This road has been lately repaired, and has a splendid surface for a mile or more, whereas that on the right leads through the old part of the town, and is extremely narrow and usually congested with traffic. The road from Colchester to Clacton, Walton, etc., is good, but dusty at times.

DORSET.—We have been informed of the very bad condition of the road between Wilton and Hindon and Mere. In our issue of July 29th we refer to this road as being in bad condition, but our correspondent states that, while he agrees as to this, the road from Wilton to Shaftesbury is practically impassable.

HERTS.—The road leading into Hemel Hempstead from St. Albans through Marlowes is in very bad order; the alternative route is through Cottrells to the north of the railway.



AN OWNER WANTED.

A parcel of half-a-dozen photographs, of which the above is one, was found in a Coventry-Birmingham train on Sunday, July 11th. The only mark was the name of the machine—a two-stroke Excelsior—and the prints were sent to the makers, Bayliss, Thomas and Co., who wish to restore them to their rightful owner.

NORTH WALES.—A correspondent informs us that the Holyhead Road between Corwen and Cerrig-y-Druidion is not by any means the worst piece of road in Wales. If anything, the road between Cerrig-y-Druidion and Pentre Voelas is much bumpier. Of all the main through roads in North Wales he states that that from Denbigh to Mold is the worst at the present time. The road from Llangollen to Corwen (main Holyhead Road) is much broken up and stony.

We shall be glad to receive further reports of further exceptionally bad stretches of road, and in writing us readers should remember that we are as desirous of hearing of repairs that have been made to bad stretches as of bad parts themselves.

The "All-khaki" Motor Cycle Race Meeting.

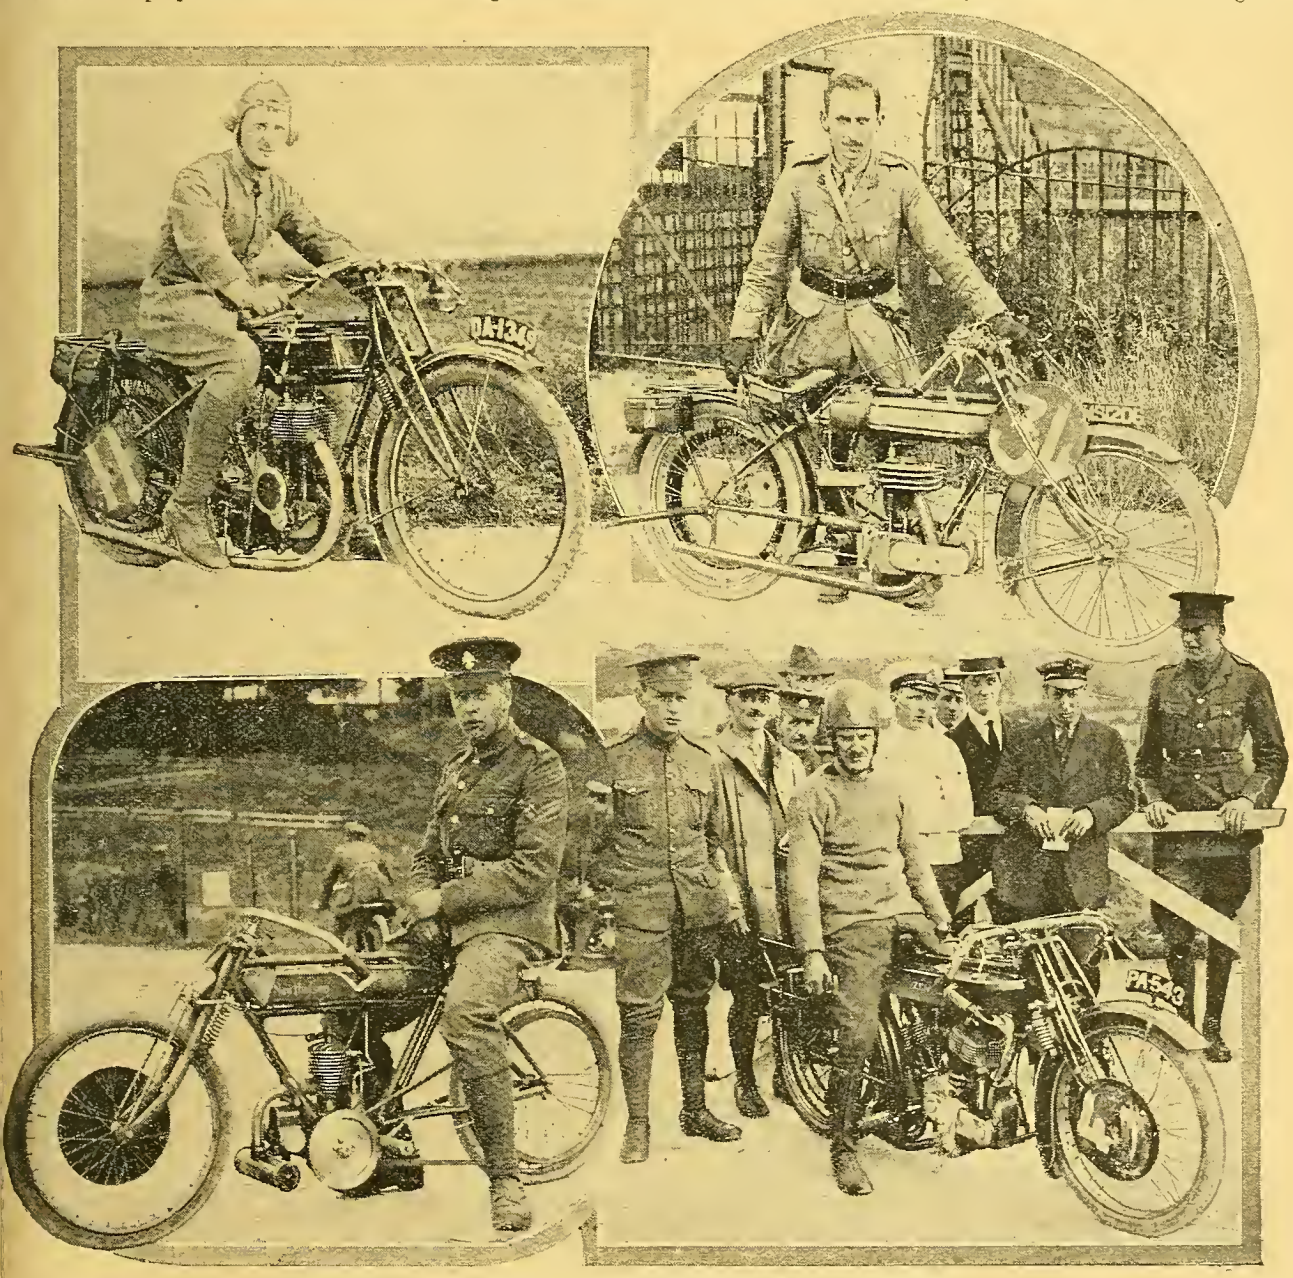
FIRST ARMY AND NAVY MEETING PROVES GREAT SUCCESS.

THE "All-khaki" motor cycle race meeting run at Brooklands on Saturday last by the British Motor Cycle Racing Club was an unqualified success. Everything went off without a hitch; even the weather, which had been unpropitious in the morning, cleared up after noon, and the sun shone brightly after lunch.

The difficulties of organisation were great. The only available portion of the track was the railway straight, and so there was no proper enclosure for the spectators. Experienced officials, owing to many of them having received their country's call, were few and far between, so the marshalling of the competitors and the keeping of the spectators off the track was by no means an easy matter. However, all the events were most successfully run off. The half-mile sprint races were started from one of the telephone boxes near the flying ground, and the races were run towards the members' bridge. The finish was marked by the timing box on wheels known as the "bathing machine," which is so familiar a feature at B.M.C.R.C. meetings. On each side of this a portion of the track was railed off for the public, while a number of spectators were also allowed on the opposite side of the course.

How it came about.

To digress for a moment, we may mention that the originator of the "All-khaki" race meeting idea was Mr. F. C. M. Houghton, of the 25th Div. Cyclist Company, whose letter containing the



SOME OF THE WINNERS AT BROOKLANDS ON SATURDAY.

(Upper) Second-Lieut. G. Barnard (3½ h.p. Sunbeam), winner of *The Motor Cycle* Cup. Lieut. A. Lindsay (Norton), winner of the 550 c.c. half-mile sprint
(Lower) Corporal A. Ward (New Hudson), first in the lightweight race. Corporal F. E. Barker (Zenith), who won three events.

The "All-khaki" Race Meeting.—

suggestion appeared in *The Motor Cycle* some weeks ago. The idea was keenly welcomed by this journal, and no stone was left unturned to foster such a commendable notion. The B.M.C.R.C. was approached, and, thanks to the excellent organisation of this body and the help of its able secretary, Mr. T. W. Loughborough, the affair was splendidly carried out, while through the publicity afforded it by *The Motor Cycle* a large entry list was forthcoming, no less than 190 being received. Thanks to Mr. Houghton, six stalwart sergeants of the 25th Div. Cyclist Company carried out the marshalling in a most efficient manner, while the spectators, being mostly soldier men, obeyed with alacrity.

The spectators were an interesting crowd, and consisted mostly of members of the British Army of all grades, ranks, and branches, men of the Royal Naval Air Service—the armoured car section—and other branches of the Senior Service, while the drab but businesslike khaki was relieved by the light blue uniforms of interested convalescents from the St. George's Hill Hospital, Weybridge.

The Races and Results.

The FIRST EVENT WAS THE LIGHT-WEIGHT SPRINT RACE FOR MOTOR CYCLES FITTED WITH TWO-STROKE ENGINES NOT EXCEEDING 270 C.C. For this race there were only four entries. Corporal Ward romped home an easy winner. Result:

	c.c.	m.p.h.
1. A. Ward, Cpl. R.F. (1-cyl. New Hudson)	211	35.8
2. C. Knight, Pte. A.S.C., M.T. (1 Sun-Villiers)	220	33.71
3. C. H. Dimmock, 2nd Lt. 9th Royal N. Lancs. Regt. (1 Connaught)	270	31.58

EVENT 2 WAS A "ONE-DESIGN" AFFAIR OPEN TO $2\frac{3}{4}$ H.P. DOUGLAS MOTOR CYCLES. It was won quite easily. Result:

	c.c.	m.p.h.
1. L. A. Fedden, Lt. A.S.C. (2-cyl. Douglas)	349	41.47
2. G. L. Andrew, Capt. Army Cyclist Corps (2 Douglas)	349	39.82
3. M. Newnham, 1st Cl. Air Mech. R.F.C. (2 Douglas)	349	28.14

Alcock, a flight warrant officer in the R.N.A.S., finished with a buckled rim and most of the spokes missing from his back wheel due to impact with a hole in the track previous to the race.

EVENT 3 WAS THE MEDIUM-WEIGHT HALF-MILE SPRINT OPEN TO MACHINES NOT EXCEEDING 550 C.C. For this an excellent entry had been received. The winner's Sunbeam was a perfect mount superbly handled, which carried its owner to victory on more than one occasion. Result:

	c.c.	m.p.h.
1. G. Barnard, 2nd Lt. R.E. (1-cyl. Sunbeam)	499	48.91
2. S. Wright, Cpl. A.S.C. (1 Triumph)	550	45.69
3. C. L. Scott, 2nd Lt. A.S.C. (2 Douglas)	349	45.23

EVENT 4, THE MEDIUM-WEIGHT HALF-MILE SPRINT FOR RACING MOTOR CYCLES NOT EXCEEDING 550 C.C., was both interesting and popular. The winner's Norton formerly belonged to Mr. McKenna, son of the well-known politician. Kendall's Norton, also a Brooklands model, is used daily in D.R. work. Result:

	c.c.	m.p.h.
1. A. Lindsay, Lt. R.A.M.C. (1-cyl. Norton)	490	50.8
2. G. Kendall, Duke of Lancaster's Own Yeomanry (1 Norton)	490	50.28
3. G. Barnard, 2nd Lt. R.E. (Sunbeam)	499	50
4. J. Alcock, Flight W.O. R.N.A.S. (2 Douglas)	349	44.78

EVENT 5 WAS THE QUICK-CHANGE PLUG RACE FOR SOLO MACHINES OF ANY DESCRIPTION.—Spare plugs in envelopes with the competitor's numbers on them were laid at intervals on the finishing line. Competitors raced from the start, changed plugs, and sprinted back to the starting point. It was an exciting and amusing affair. Most people badly overshot the mark, while one or two seized the wrong plug. Our old friend F. E. Barker, now one of the instruction staff at an A.S.C. depot, got away long before anyone else, having changed his plug in record time. Result:

	c.c.
1. F. E. Barker, Cpl. A.S.C., M.T (2-cyl. Zenith)	350
2. A. Lindsay, Lt. R.A.M.C. (1 Norton)	490
3. H. R. Whitmore, Lce-Cpl. R.E. (2 Lea-Francis)	496

Time, 1m. 53s.

EVENT 6. THE UNLIMITED HALF-MILE SPRINT FOR MOTOR CYCLES OF ANY DESCRIPTION NOT EXCEEDING 1,000 C.C., produced another historical machine—the twin Matchless, ridden by McColl, which formerly belonged to C. R. Collier. This event was run in two heats. In the first Barnard was the winner, Edwardson (Zenith) second, and F. E. Barker third. Result in final:

	c.c.	m.p.h.
1. A. McColl, motor cyclist, R.E. (2-cyl. Matchless)	994	52.63
2. A. Lindsay, Lt. R.A.M.C. (1 Norton)	490	52.02
3. G. Barnard, 2nd Lt. R.E. (1 Sunbeam)	499	51.72
4. O. M. Baldwin, Cpl. A.S.C. (2 Matchless)	994	51.43

EVENT 7 WAS FOR SIDECAR MACHINES UP TO 1,000 C.C. OR LIGHT CARS AND CYCLE CARS UP TO 1,100 C.C.—The latter were run off first, and this heat was easily won by Chief Petty Officer W. G. McMinnies, R.N.R.S., on a racing Morgan fitted with an eight-valve M.A.G. engine. Result:

	c.c.	m.p.h.
1. F. E. Barker, Cpl. A.S.C. M.T. (2-cyl. Zenith) ...	988	46.15
2. W. G. McMinnies, C.P.O., R.N.A.S. (2 Morgan)...	1,100	45.92
3. H. F. Edwards, Pte. Artists' Rifles (2 Zenith)	994	44.78
4. F. B. Halford, Lt. R.F.C. (4 Calthorpe-Minor) ...	1,080	43.69

The Hill-climbs and Tortoise Race.

Everyone quickly evacuated the railway straight and made for the test hill, on which EVENT 8, THE JUNIOR HILL-CLIMB FOR MOTOR CYCLES OF ANY DESCRIPTION NOT EXCEEDING 350 C.C., was run off. Twenty-five yards start was allowed in this and other hill-climbs. Results:

	c.c.	m.p.h.
1. F. E. Barker, Cpl. A.S.C., M.T. (2-cyl. Zenith) ...	349	26.69
2. G. L. Andrew, Capt. Army Cyclist Corps (2 Douglas)	349	
2. C. L. Scott, Lt. A.S.C. (2 Douglas)	349	
4. L. A. Fedden, Lt. A.S.C. (2 Douglas)	349	

EVENT 9, THE SERPENTINE SLOW RACE, was an interesting and amusing affair. The competitors had to ride as slowly as possible in and out of the natural obstacles provided by the sheds of the paddock.

The test of skill was rendered the more difficult owing to the fact that that part of the paddock leading to the flying ground was in a bad condition, and the places where the cement had given way had been filled in with loose gravel. The event had to be run off twice, as no one succeeded at the first attempt, so, instead of every shed, every other shed had to be negotiated. Any competitor who put foot to the ground was disqualified. Barnard, the winner, used his clutch magnificently, and made extraordinarily slow time, which is all the more to his credit, as he won the medium-weight sprint on the same machine. The second man also put up a fine performance.

Assistant Paymaster C. P. Marcel, R.N.R., driving his Indian in the serpentine race, in and out of the car sheds.

All-khaki—and Navy Blue.

The "All-khaki" Race Meeting.—

Result :	c.c.	Time. m. s.
1. G. Barnard, 2nd Lt. R.E. (1-cyl. Sunbeam) ...	499	3 6⅖
2. O. J. S. Scholte, 2nd Lt. 3rd Bedfords (2 Harley-Davidson) ...	—	2 34⅘
3. G. H. Walker, 2nd Lt. 25th Div. Cyclist Co. (2 Enfield)	425	1 53

EVENT 10. MEDIUM-WEIGHT HILL-CLIMB FOR MOTOR CYCLES OF ANY DESCRIPTION NOT EXCEEDING 500 c.c.—

Result :	c.c.	m.p.h.
1. G. Kendall, Pte. Duke of Lancaster's Own Yeomanry (1-cyl. Norton)	490	33.36
2. G. Barnard, 2nd Lt. R.E. (1 Sunbeam)	499	32.46
3. G. H. Walker, 2nd Lt. 25th Div. Cyclist Co. (2 Enfield)	425	31.79

EVENT 11. UNLIMITED HILL-CLIMB FOR MOTOR CYCLES OF ANY DESCRIPTION NOT EXCEEDING 1,000 c.c.—The only incident was McColl's fall at the foot of the hill, due to his missing a broken footrest while mounting. He was allowed another try. The competitors' speed at the top of the hill was such that their machines made extraordinary jumps.

Result :		
1. G. Barnard, 2nd Lt. R.E. (1-cyl. Sunbeam) ...	499	33.36
H. F. Edwards, Pte. Artists' Rifles (2 Zenith)	994	
3. G. Kendall, Pte. Duke of Lancaster's Own Yeomanry (1 Norton) ...	490	32.46
R. A. Waddy, Pte. Oundle O.T.C. (2 Indian) ...	994	

At 6 p.m. the prizes were distributed by Mrs. Nicholl, wife of Major D. F. Nicholl, D.A.A., Q.M.G., who acted as steward in company with Captain Loughborough, R.G.A., and Dr. A. M. Low, D.Sc., Lt. R.F.C. Some amusement was caused by F. E. Barker winning three cigarette cases.

The Aggregate Cup, presented by *The Motor Cycle*, was won by G. Barnard, 13 points, while Barker was second with 9 points.

In view of the unqualified success of this meeting, it is hoped to be possible to arrange another in a month's time.

A great success!

That was the consensus of opinion of those who witnessed the first Brooklands meeting for not only khaki-clad men but "sons of the sea"—but British all of them.

It was a letter in *The Motor Cycle* from Second Lieut. F. M. C. Houghton that brought about this novel and interesting meeting.

An amusing feature of the meeting to practised competition men was the novelty of the thing. Many of the competitors had never ridden in a race before, some had never seen Brooklands, and up and down the track they careered like boys let loose. They bobbed up from everywhere. What an anxious time the officials had!

A. G. Reynolds, the timekeeper at the start, several times carefully gathered the competitors together on the line, and whilst busily counting off the seconds a rider would suddenly decide to give his engine a warm up, and off he would shoot down the track. Fellow competitors would resolve to do the same. Once again the men were gathered in and the worried but good-natured timekeeper would give them a proper send-off.

We would like to wager that we have seen some of the competing machines at previous important events in the Isle of Man and elsewhere.

What a good idea it was to invite a party of wounded soldiers from the neighbouring military hospital. They appeared to enjoy the fun immensely—not least of all the activities of the three "bookies" present.

The "bookies" had a fine haul in one event. They offered 4 to 1 on the field, and everybody knowing "the" winner placed money on their fancy, and the winner turned out to be a man *not on the programme!*

The fastest Douglas on the track, tuned up by S. L. Bailey, hit a hole in the track during practice and buckled the back wheel.

It was unfortunate that the state of the track precluded the possibility of complete circuits being made at speed. The defect of short sprint races is that everything depends upon a quick start. Most of the races were decided in the first 200 yards.

We suggest that the next event be named the United Services or Army and Navy meeting. By September the finishing straight will have been repaired, and the racing would consequently be much better viewed by the spectators. Intending competitors should send in their names early to Mr. T. W. Loughborough, c/o the A.C.U., 83, Pall Mall, S.W.

The eight valve Morgan driven by W. G. McMinnies was just beaten by a 7 h.p. sidecar. McMinnies told us that he could do 45 m.p.h. on his low gear ratio of 7½ to 1.

Most of the finishes were rather straggly, but in Event 4 Lieut. A. Lindsay charged through the field in the last 150 yards to win comfortably.

Just before the start one competitor, recognising a well-known official of a leading company, enquired how to tune his machine up for speed. He was recommended to remove the mudguards, which he did in quick time.

There were some cunning men in the plug changing or "finger burning" contest. Several never used a spanner at all; they had fitted the plug loosely in the cylinder, and after riding the course exchanged it with the fingers. Quite simple; the times as a result were wonderfully quick.

Expert motor cyclist spectators present agreed that practically all the competitors handled their machines most skilfully, whether in the sprint racing, hill-climbing, or slow race.

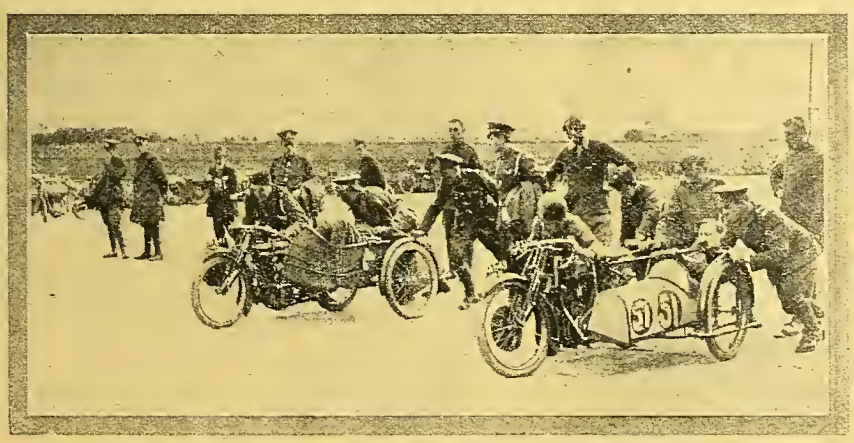
Those who tried the whole of the track were amazed at the size and depth of the holes caused by the passage of motor lorries to and from the flying sheds. It will take weeks and the outlay of much money to put it into order again.

Both naval and military men figured among the prize winners.

A jollier and more healthy-looking lot of competitors never gathered together. When Mr. Loughborough called for a naval winner to come and take his prize from Mrs. Nicholl, "Aye, aye, sir," was the ready response.

Anyone in civilian attire felt quite "out of it" at Brooklands on Saturday.

Among competitors and spectators one recognised many old Brooklands *habitués* and Six Days Trials riders, out in very different attire from those good days.



Start of the sidecar race which was won by Corporal F. E. Barker (8 h.p. Zenith).

Roads to Avoid.

The Wisbech-Peterborough road is in very bad condition between Guyhirne and Thorney.

The Accident to Mr. and Mrs. Stevens.

We are glad to announce that Mr. and Mrs. Harry Stevens, whose unfortunate accident we referred to last week, are now considered quite out of danger. Mrs. Stevens has been able to get up, but Mr. Stevens has not got on quite so well owing to septic poisoning setting in three days after the accident.

A North-country Hill-climb.

The Liverpool Motor Club anticipate holding an open hill-climb at Pen-y-ball, Holywell, on Saturday, September 11th, provided sufficient entries can be secured. The whole of the profits will be handed over to one of the war funds, and in order that the sum may be as large as possible, the prizes will be of nominal value, or they may take the form of War Loan vouchers. Entries should be forwarded to the Secretary, Mr. W. H. Bullock, St. George's Restaurant, Red Cross Street, Liverpool, forthwith.

National War Funds.

On Tuesday last the principal War Funds stood as follow:

	£	s.	d.
The Prince of Wales's National Relief Fund	5,431,671	0	0
Queen's Work for Women Fund ...	163,511	0	4
The Times Fund for Sick and Wounded ...	1,609,689	8	9
Fund of National Committee for Relief in Belgium	745,000	0	0

Glengarriff Trial Results.

Following are the awards in the two days open trial of the Dublin and District M.C.C., reported on page 131 of our last issue:

WINNER OF CUP.—Mooney (Bradbury sc.)

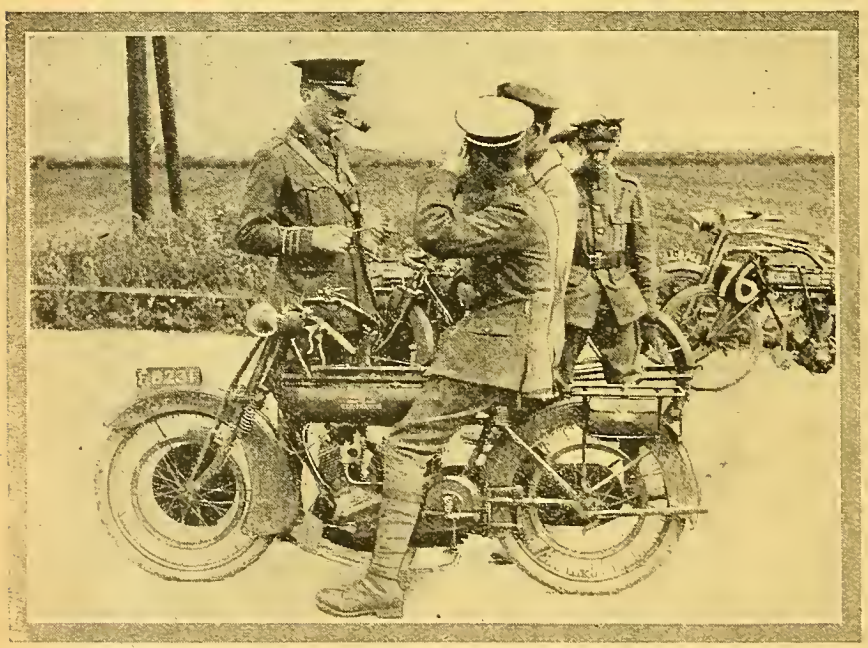
GOLD MEDALS. — Mooney, Farren (Indian), Hurse (B.S.A.), Brown (Rover), Toole (B.S.A.), Woods (B.S.A.), O'Dwyer (B.S.A.), Roche (Rover), Sullivan (Sunbeam), Hartigan (Scott), and Cunningham (Bradbury).

SILVER MEDALS.—Curtis (Indian sc.), Clarke (Rudge), Doleman (Rover), Henderson (Harley-Davidson sc.), Kettle (B.S.A. sc.), and Collins (Enfield sc.)

BRONZE MEDAL.—Ladd (Bradbury sc.)

BINKS PRIZE for best performance outside cup winner.—Farren (Indian sc.)

SPECIAL SILVER MEDALS for two-stroke performances.—Allen (Sun) and Dick (New Hudson).



SATURDAY'S "KHAKI" MOTOR CYCLE MEETING AT BROOKLANDS.

RELIABILITY, SIMPLICITY, AND ACCESSIBILITY. (Illustrated)

Russian Orders for Motor Cycles.

Russian Government officials are or again busy placing orders for mo cycles with the leading British mar facturers. It is still difficult, if r impossible, to obtain prompt delivery a 1915 model. Indeed, we have seve times heard of premiums being offer for early delivery.

Second-hand Prices.

We have followed a somewhat differe plan this week from that hitherto adopt in giving average prices. Formerl when there were not a sufficient numb of one particular model advertised in t previous issue to give an average th model has been omitted. We have no adopted the plan of quoting those mode of which at least five weekly averag have appeared during the past tv months. In this way one gets a fair average, and at the same time a mo comprehensive list.

Cheap Garage Accommodation.

At the Birkenhead Ferry, at the top of the stage, the Corporation have a large well-lighted and dry room in which motor cycles are stored. For twenty-four hours the charge is 2d. (sidecar 2d. extra), and for each day over the twenty-four hours from entry a charge of 1d. per day is made. There must be few places offering such cheap accommodation as this.

Important to Tourists bound for Scotland.

The main Carlisle-Gretna Road between Floriston Road End and Moss Band Road End is closed to all vehicular traffic pending the completion of a new bridge. Motorists travelling north should turn to the right at Kingstown, and so reach Gretna *via* Longtown. In the opposite direction the Longtown détour should be followed by turning to the right at Longtown about four and a half miles east of Gretna.

"The Motor Cycle" in Germany.

A member of Messrs. Iliffe and Sons' staff, Lieutenant C. E. Wallis, has sent us the photograph reproduced on this page. Lieutenant Wallis was wounded and taken prisoner as long back as last September, so that by the time the war is over he will have had a fairly lengthy experience of life as a captive in the hands of the enemy. Thanks to the efforts of the United States Ambassador in Berlin, the lot of our men in Germany has undoubtedly improved during the past few months, and certainly Lieut. Wallis and his friends look more comfortable in the photograph than was evidently the case some little time back. *The Motor Cycle* finds its way to the camp at Stralsund (where Lieut. Wallis is interned) just as it reaches practically every other country. Lieut. Wallis is one of 130 members of the staff of Messrs. Iliffe and Sons (proprietors of *The Motor Cycle* and allied papers) who have answered the country's call.

A Decompressor Lever.

An enthusiastic rider of a P. and M., who is an engineer, tells us that he has riveted to the plate of his decompressor a lever about 1ft. in length, made of flat iron $\frac{1}{8}$in. × $\frac{5}{8}$in., which is cranked slightly and fitted with a knob at the end. He can thus operate the decompressor by hand without stooping from the saddle. This he finds invaluable in traffic and for easy starting.

An Enterprising Firm.

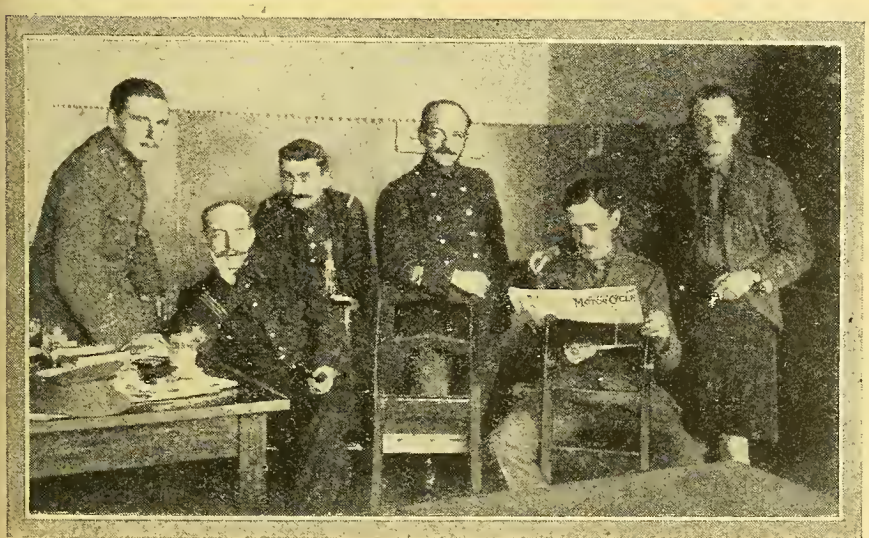
A walk round the Quadrant motor cycle factory showed that this firm at any rate had thrown itself thoroughly into the important war work that is on hand. Several new and immensely expensive machines have been installed of late in order that the firm may be in the best possible position to execute the Government work which it has undertaken.

Rims and Tyres.

We would urgently warn our readers against attempting to fit 26in. × 2½in. covers on voiturette rims suitable for 650 mm. × 65 mm. voiturette tyres. Though 650 mm. × 65 mm. is practically the same as 26in. × 2½in., the two rims are quite different, and the motor cycle beaded cover will not fit one of these rims nicely. It is sure to give trouble sooner or later if placed thereon.

Electrical B.H.P. Tests.

A new electrical testing set has been installed at the Levis works and specimen engines will regularly be tested on this installation. We recently witnessed one of the first tests on a 2¾ h.p. standard two-stroke Levis and a reading of 3 electrical h.p. was obtained at 2,300 r.p.m. Rather an interesting fact was brought to light during the test. In order to convey the exhaust gases away from the engine a pipe two and a half yards long has been made with a couple of gradual bends in it. When this pipe was fitted it was found to absorb no less than ½ h.p.



"THE MOTOR CYCLE" IN A PRISONERS' CAMP IN GERMANY.

Reading the paper is Lieut. C. E. Wallis, of the staff of Messrs. Iliffe & Sons Ltd., publishers of *The Motor Cycle*, who was wounded and taken prisoner by the Germans in the early days of the war. On the right is Lieut. Kevill Davis, who before the war was with Messrs. Bentley & Bentley, Ltd., agents for the French D.F.P. car.

Woolwich M.C.C. Paperchase.

The trail for the re-run paperchase of the Woolwich Club on Saturday next will be laid by J. Wood (of the Yeomanry), on his new Matchless, and T. J. Ross (special constable), on a T.T. Triumph. A secret course has been planned, including a new Kent hill. A gymkhana will follow.

New Identification Marks.

London has been assigned yet another additional mark for registration purposes. This is LP, previous ones being A, LC, LN, LB, LD, LA, LE, LF, LH, LK, LL, LM, and LO.

OB is the new mark for Birmingham previous marks being O and OA.

The London-Birmingham Road.

It is surprising how quickly the main road surfaces deteriorate in these times of heavy war traffic. The London-Birmingham road will probably surprise many who, owing to pressure of business, etc., have been unable to motor along this famous road for the past few weeks. Practically the whole way from Coventry to London is in a state of road waves, due to the heavy lorries, which number frequently several hundreds a day. A well-known motor agent in Dunstable with whom we chatted told us he had counted as many as fifty of one make alone.

A Proposed New Overseas Model.

Many readers who will later on be looking out for a good single-cylinder machine with plenty of ground clearance, for use where Colonial conditions exist, will no doubt be glad to learn that it is more than probable that the Norton Manufacturing Co. will, later on in the year, place a machine of this description on the market. It is intended to construct it so that at no point will the ground clearance be less than 6in. The long stroke Norton single-cylinder 4 h.p. engine will be used, and the transmission is to be by chain.

100 Miles an Hour.

The 100 m.p.h. mark is still tempting to many a racing man, and credit for such an achievement is greatly sought. With a view to rendering this prodigious speed possible on a motor cycle, the railway straight at Brooklands, on which the Army and Navy events were run last Saturday, is to be put into thorough order in the course of the next few weeks, and the two eight-valve Indians in this country are to be brought out again. C. B. Franklin, the Irishman, and Sydney George will ride the machines, and Mr. Wells is confident that one or other will be successful, as the mounts are now tuned up better than ever before, and it will be remembered that George last year came very near to attaining the desired speed.

Harry Martin is another who has several times announced his intention of attempting this coveted record. Martin will probably use an 8 h.p. twin J.A.P.

Last year Charlie Collier had an eight-valve M.A.G. engine built up into a motor cycle frame, but only appeared on it once or twice prior to the war, since when, of course, racing of all kinds has taken a back seat. It seems likely, however, when normal times are restored, that events for eight-valve twin-cylinder machines will be arranged.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Lubrication of Twin Engines.

Sir,—From time to time I notice letters complaining that the front cylinder of a twin "V" engine gets starved of oil, or the back cylinder gets too much. The best remedy is, I believe, to lead the oil direct to the front cylinder.

What I want to know is, why do not the manufacturers do this in the first place, as the trouble seems to be universal? Any other course seems to me unbusiness-like. G.

A Monst r Racer.

Sir,—I enclose herewith photograph of myself and a French Peugeot racing machine. Perhaps the machine may be of interest to the readers of *The Motor Cycle*. The motor is a four-cylinder V type; Longuemare carburetter and Le Febre oiling device are also fitted Ignition is by six dry cells, contained in the triangular box mounted at the head of frame, and two sparking coils, one on each side top frame tube.

No brake nor pedalling gear is fitted, and the motor when "opened" up has a wonderful turn of speed. No one here has the pluck to leave the motor opened for any length of time.

I hope next spring to bring my touring model, a 7 h.p. Indian, to England to tour. If I cannot get passports I will try to join some department of the Government that will enable me to come over.

As I own machine and sidecar I believe I should have no trouble in enlisting in the hospital or some other service. There are lots of German residents here, but they are little liked, and I threw away a tyre pump stamped "Blumel," "made in Germany," and bought another made in U.S.A. The only thing left on my machine that is German is the Bosch magneto, and that in name only; the magneto was manufactured in Springfield, Mass.

SAMUEL RAGAN, JUNR.

Vicksburg, Miss., U.S.A.

A four-cylinder V-type Peugeot engine fitted to a motor cycle owned by a reader in the United States, who informs us that its speed capacity is such as to frighten most of his friends who have ridden it.

No. 7 Battery M.M.G.S.

Sir,—I notice in *The Motor Cycle* of July 15th a letter from G. C. Wheeler, of No. 10 Battery M.M.G.S., and should be very grateful if you would put the following correction in your next issue.

No. 7 Battery *has* been in the trenches doing its share, and, secondly, that it is *not* attached to a cavalry division.

WILLIAM W. HONYWOOD,
Lieut., 7th Battery M.M.G.S.

Timing of Two-strokes.

Sir,—Having had a trip spoilt partly through laziness and partly through want of time, may I be allowed to give some advice to other riders of two-strokes, although it is not new.

I recently sent my machine to a garage to have the driving chains shortened. Since then it has been going "rottenly." The trouble I have found is entirely due to wrong timing. Two-strokes, I believe, vary very much in this respect, consequently, I do not blame the mechanic who reassembled the engine, more especially at the present time when most garages are short-handed. As it is the simplest thing possible to check the timing, I should advise others to do this. EL 1160.

Exmoor Roads.

Sir,—Can any of your readers who are familiar with the roads in North Devon and Somerset enlighten me on the following two points?

At the top of Porlock Hill, a mile or less beyond where the new and the old roads join, a road goes off to the left down to Oareford and Oare. Another road runs from close by County Gate direct down to Oare. Is either (or both) of these roads rideable and climbable to the average touring mount? Also, how far up towards the Doone Valley could a sidecar outfit make its way?

I should be very grateful for any information on these points. EL 1969.

The Motor Cycle in the Argentine.

Sir,—Being a constant reader of your interesting journal, I take the liberty of writing you a few lines with regard to motor cycling in the Argentine, which I trust will be of interest to you and your readers. One sees many different English motor cycles out here, but the most prominent are the American Indian, there also being a great number of other well-known American makes. The prominent place occupied by the Indian is due to its fame for speed work in this country, which appeals very much to our motor enthusiasts; and, secondly, for its rear springing, with its consequent comfort, which I consider is highly necessary on account of the roads one encounters. I follow very keenly your articles and other readers' opinions on this subject, and await the day when rear springing will become universal.

There are several motor cycling clubs in the country, and excursions are held frequently, weather permitting, as after rain the roads outside the capital are impossible for cycles, sometimes for days, and sometimes for weeks in the winter. Now and again track races are held, and yearly a road race is held between the capital and the city of Rosario, a distance of 190 miles or so. As a rule the latter race is postponed several times on account of the rains, the roads simply being tracks running through the open camps.

KEEN TRIUMPH RIDER.

Quilmes, Prov. B. Ayres.

Mr. LIONEL S W. ROOK, of Erdington, writes:—

"Now a word about the gear. I am more than satisfied with it. Last week I and a passenger (about 20 stone in all) made a non-stop run from here to Ledbury, which means, as you know, some stiff pulling over the Malverns. Twice going up the Wyche I was baulked and nearly stopped, but the pulley answered perfectly, and you can guess how very pleased I was. In fact, to sum up, I have tested it in every conceivable way, and it has always acquitted itself wonderfully, and I must congratulate you on your ingenuity in producing such a novel gear. Rest assured I shall recommend it wherever possible."

Read what "The Motor Cycle" says:—

"We were afforded an excellent demonstration of the action of the gear on a 3½ h.p. Triumph. Not only was free engine obtainable, but on the very lowest gear, when the belt was quite slack, there was no sign of slip, and in this position it was impossible to prevent the motor cycle from moving off easily by any attempt to hold it back."

Mr. H. W. PHILLIPS, of Blackheath, London, writes:—

"I am pleased to inform you this is a very satisfactory gear and works splendidly."

Mr. H. THOMPSON, of Hurley, Artherstone, writes:—

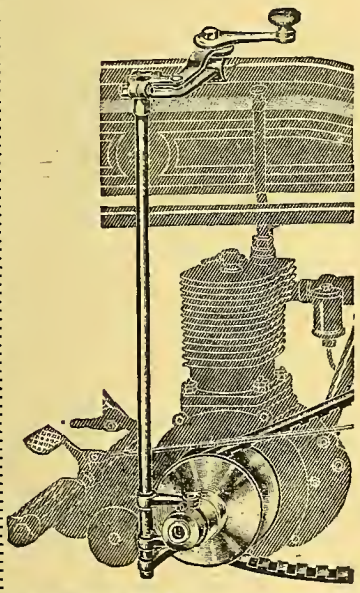
"The Grado Multi-Pulley that was fitted to my bike a little while ago is very good, and I am satisfied with it. It certainly does all that one requires. I am 15 stone, and I often take a 10-stone passenger, and can get up all hills although my machine is only a 3½ Blumfield. In traffic one can travel as slow as desired. For starting it is quite all right, and one can guess I feel the benefit, being a heavy man. The old method of pushing was hard work. I shall have pleasure in recommending your pulley at any time."

Read these letters from riders who have proved the value of

The GRADO

The Simple Variable Pulley arrangement for Belt-driven Machines.

Multi-Gear.



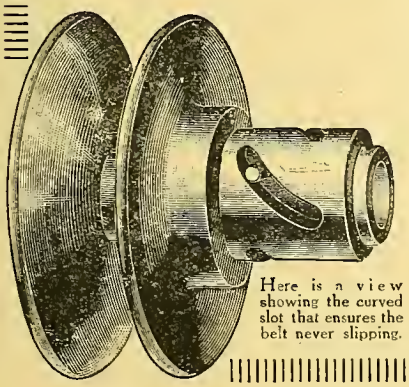
The GRADO GEAR as fitted to machine.

The Grado Gear is most simple in construction—there is nothing to get out of order, and it can be fitted to a standard belt-driven machine in 2 to 3 hours. Why not write for our Catalogue TO-DAY?

PRICES.

Pulley complete (as illustrated), bored to suit engine shaft up to 4½ h.p.	**£3 3 0**
Up to 6 h.p.	**£3 10 0**
Lightweights	**£2 10 0**

We can supply a Special Pulley for engine with Extending Crank Bosses, like the J.A.P., Old Rex, Minerva, etc., for 10/- extra. Recess up to 1⅜in. diameter; up to 2¼in. diameter, if necessary, 12/- extra.



Here is a view showing the curved slot that ensures the belt never slipping.

Hermetic Works ..... Birmingham.

F.W.W

Electric Lighting on Motor Cycles.

Sir,—I am rather interested in electric lighting on motor cycles from primary and secondary batteries, and I therefore found the article on "The Simplest Form of Electric Lighting," by "H.W.H.," in your issue of the 22nd inst., of interest. Your contributor, however, has made one or two errors which I would like to point out for the benefit of those who intend adopting either primary or secondary batteries for lighting purposes.

Under the heading, "Dry Batteries," he says, with other things, "Here it should be pointed out that, with the same current consumption, the greater the number of cells and higher electro-motive force, the stronger will be the current and greater the light, but the smaller will be the actual capacity. It is, therefore, desirable to use a battery with the least number of cells consistent with a sufficiency of light."

This sentence is extraordinarily wrong, and is misleading, insomuch that it is entirely contrary to facts. Raising the electro-motive force of a battery does *not* raise the current; in fact, the higher the electro-motive force the *lower* the current. Therefore, it is wise to carry the maximum number of cells possible, for high electro-motive force means lower current, and, consequently, longer battery life.

Further in the article, "H.W.H.," referring to the "Volex" rear light, makes another mistake. He says that a four-volt battery of the same size as the two and a half-volt battery has *less* capacity, though it is capable of generating a *stronger* current. How any four-volt battery of the same size as a two and a half-volt battery can have less capacity and yet be capable of generating a higher current I really cannot imagine. In fact, the four-volt battery supplying lamps of the same candle-power and make would last infinitely longer, because, as is herewith shown, the current is lower.

Say a lamp takes one watt per candle-power and the total candle-power is four, the total watts are, therefore, four. To find the discharge current of a two-volt battery, divide the watts by volts thus: $\frac{4}{2} = 2$, which is ampmeters, the discharge current.

Now, say the battery is a four-volt one, divide watts by volts as previously, and we get $\frac{4}{4} = 1$ ampmeter, which shows that the higher the voltage the lower the discharge current, and, consequently, longer battery life.

I am a great believer in electric light, and I think that if motor cyclists just knew how to choose a battery to get the best results this form of lighting would compare very favourably with other forms regarding cost, and in other respects, in my opinion, it is in advance of most of them.

W. R. MONTGOMERY.

[We submitted this letter to the writer of the article, and his reply is appended.—ED.]

Sir,—I should like to remind your correspondent of the following facts, to all of which he will find a reference made in the article.

First, he will notice that 2½ and 3½ volt bulbs described—and which were to be "considered closely in conjunction with the battery capacity"—consume approximately .25 to .3 amp. each, so that, supposing for a given purpose a 2½ volt .3 amp. bulb is found to give a sufficient light, then the substitution of a higher E.M.F. in battery and bulb will only result in a greater light, and not in a decrease of the discharge rate.

With reference to the discharge rate of a dry battery in use, I myself always understood it to be whatever the lamp itself consumes. The capacity of a dry cell, and therefore of a dry battery, increases in proportion to the increase of its volume. It therefore follows that increasing the number of cells in a battery of given dimensions must, whilst raising the E.M.F., lower the total ampèrage capacity. Bearing in mind the above-mentioned fact, that both bulbs consume the same quantity of current, it is clear that a three-cell battery will not light a 3½ volt lamp for the same length of time as a two-cell battery of the same volume would light a 2½ volt lamp.

A practical test—one upon which I based my statements—can easily be made. Obtain one each of the two batteries (two-cell and three-cell), and use with the lamps pointed out as suitable for each. The two-cell battery will be found to give 50-60 hours lighting, but the three-cell battery will become exhausted after about 25-30 hours use. Manufacturers themselves frequently draw attention to this fact in price lists.

H.W.H.

The Motor Cycle in Australia.

Sir,—I am always pleased to see in your journal, of which I have been a reader for over two years, any reference to things motor cycling in Australia. I saw in the number for April 29th the three photographs of our good roads which are stated to be within 150 miles of Melbourne. Two of them are, if I am not mistaken, within ten miles of the city. The long straight hill shown is known as Spring Hill, an easy gradient on the main north-west highway, and is about eight miles from Melbourne. The arched bridge shown is about one and a half miles further on the same road, and is at the foot of Curly Hill, so-called from having four bends. As a contrast to the good road at the foot, this hill is decidedly stony and rough. If these are not the spots shown, the photographer will please correct me. Speaking of good roads, there are plenty of these in Victoria, also plenty of bad ones.

Our 100 miles road race (the most important of the year) was held on the King's Birthday at Mortlake, a small town 150 miles from Melbourne. In spite of the distance from the capital, hundreds of motorists and motor cyclists rode to see it, the road for practically the whole distance being beautifully smooth. The race was held over a triangular (three laps) course, 33½ miles round, which except for the corners, was safe for full throttle all the way. Unfortunately, rain fell the day before the race, and also while it was in progress, this, of course, lowering the speed considerably. The winner proved to be R. Finlay, on a 7 h.p. American Excelsior, whose time was 112 minutes. Second man was E. Mayman, 3½ h.p. twin J.A.P., with E. Tyler, Triumph, third, and fastest under 600 c.c. The machine ridden by Mr. Tyler was one of the 1914 countershaft models used in the T.T.

Motor cycles are selling at the rate of seventy a week and more in the State of Victoria alone; this in spite of the war and high prices. The single is very popular, and great numbers of locally built machines are seen, Precision and J.A.P. engines seeming to divide the popularity. The Big Four, as the big single Precision is called here, is being built up in very large numbers, whilst the 5-6 h.p. J.A.P. twin is seen everywhere. T.T. or semi-T.T. bars are the most popular, and are undoubtedly the best for comfort.

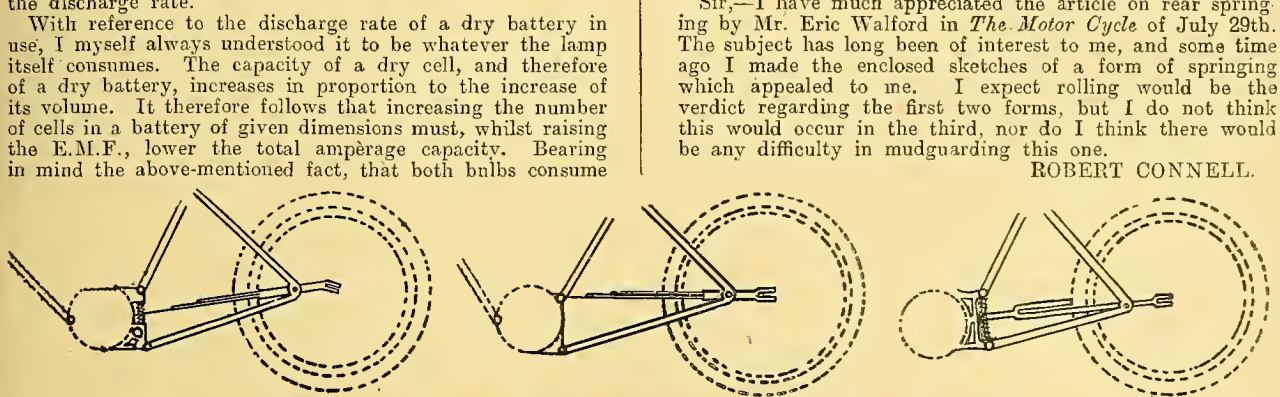
The *tout ensemble* of the Australian assembled machines is very pleasing, often more so than British machines, while the makers know, by experience, that enormously strong frames are required, and their work is second to none.

Melbourne. 85×88 PRECISION.

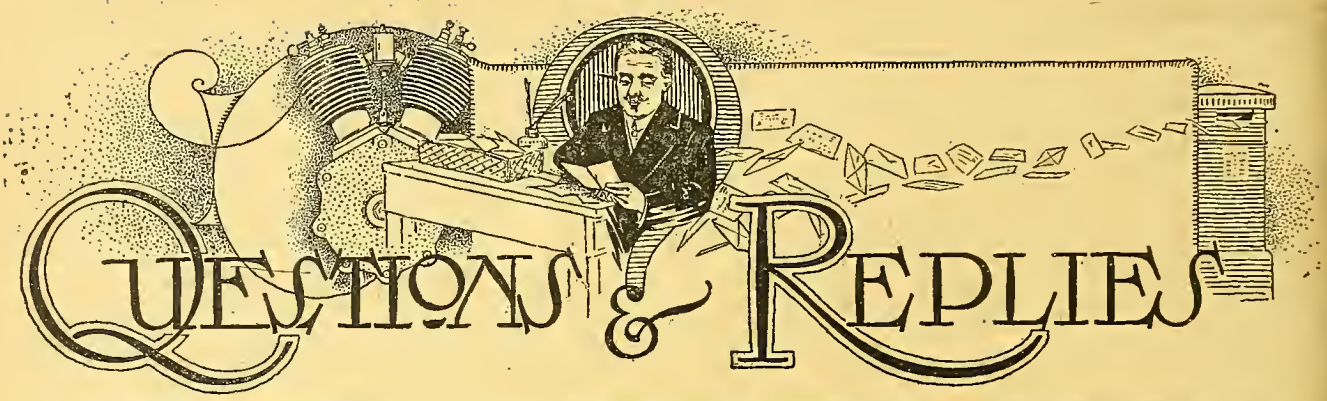
Rear Springing.

Sir,—I have much appreciated the article on rear springing by Mr. Eric Walford in *The Motor Cycle* of July 29th. The subject has long been of interest to me, and some time ago I made the enclosed sketches of a form of springing which appealed to me. I expect rolling would be the verdict regarding the first two forms, but I do not think this would occur in the third, nor do I think there would be any difficulty in mudguarding this one.

ROBERT CONNELL.



Three alternative designs of rear sprung frame suggested by Mr. Robert Connell.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The Advantage of Large Tyres.

I have a 2½ h.p. motor cycle, and I find the back tyre (26in. × 2in.) wears very much more rapidly than the front tyre. As I very rarely use either of the lower gears the excessive wear is, in my opinion, due to the extra weight of the hub gear, extra tool bag, and sundry articles carried on the carrier. As there is ample space between the back stays, could I fit a larger and stronger tyre than 26in. × 2in. on the 26in. × 2in. rim? If so, what size could I safely fit? Would the existing inner tube (26in. × 2in.) do for a slightly larger tyre, or should I have to fit a larger tube as well?—H.S.

You could fit a 2¼in. or 2⅜in. cover on a 2in. rim. The existing tube will serve, but it is better to fit one of the correct size. It is only natural that there is more wear on the back tyre than on the front, as it has to do all the work of driving.

Benzole as a Fuel.

I have been informed that benzole is injurious to metal, and will in time eat away the metal of the tank. As I am very sceptical regarding this statement, I shall be glad if you will kindly inform me if there is any truth in it at all. Also please inform me exactly what alteration would be necessary to a B. and B. carburetter if I decide to try benzole. I am quite a novice at present, and shall be glad of your kind assistance.—A.M.M.

Benzole, if reasonably pure, is not injurious to metal. It will not eat away the metal of the tank, but will rapidly remove the varnish from the outside if spilt over. Of course, if the benzole contains impurities, such as acids, the metal is likely to be damaged. If you use a mixture of one-third benzole and two-thirds petrol you will get all the advantages of benzole and none of its disadvantages. For instance, it will not foul your engine, it will give better running at slow speeds with total absence of knocking. The only alteration which might be necessary is that you might have to weight the float a trifle or use a smaller jet, but you will probably find, even when using pure benzole, that you will not have to alter the carburetter at all.

Overheating.

I have a 1915 two-speed, two-stroke, 2¼ h.p. It gets fiercely hot on hills, slows down gradually, and stops altogether. After waiting five to ten minutes it will start off again, but if the hill is a long one it fails a second time. I have done 600 miles altogether, the machine being new when purchased. The compression is very good. The first 300 miles it took hills on top gear. Can you advise me what to do to increase the power on hills and to avoid overheating? I think I have over-oiled.—J.F.P.

You may try fitting a smaller jet. This might cure the trouble. Also use a plug the points of which do not project too far into the cylinder and are fairly substantial. Such symptoms are often caused by pre-ignition, due to an unsuitable plug being used. It would perhaps be as well to replace the top piston ring if this is at all discoloured, and at the same time remove all traces of carbon deposit from the cylinder and piston. Clean the inside of the piston as well as the top.

Belt Adjustments.

(1.) What is the usual cause of a belt twisting in the pulleys? I have suffered considerably from this trouble of late. The belt is 1in. Dunlop on a 3½ h.p. twin J.A.P. with Sturmey-Archer three-speed hub. The alignment and tension have been checked and found correct. When the twisting occurs, the pulley is found to be rather hot, but I have not enough experience to know the temperature to be expected there after about twenty miles running, which is when the trouble begins. Is the depth of the belt insufficient? (2.) Is it usual to make no provision for adjusting alignment with an adjustable pulley? (3.) Has any arrangement ever been tried for varying the ignition while riding by partially revolving one of the gear wheels on its shaft, so obtaining invariably a spark of equal strength? What is the objection to such an arrangement?—E.V.W.

(1.) The trouble is caused by the belt being too large for the pulley. If the belt is hot, it is a sure indication that it is slipping. It is probably the back pulley which is too small. (2.) No, an adjustable pulley throws the belt out of line so little that no correction is worth while. (3.) Yes, this has been tried on several occasions, but the idea has apparently never become popular. It was done in the case of the Eisemann car magneto and on the Enfield 2¼ h.p. twin machine made in 1910 and 1911. The advantages gained have not, so far, justified the extra complications entailed.

Licences.

I should be glad if you would let me know if I can ride a motor cycle with a car licence, as I have a licence to drive a motor car, and am going in for a motor cycle.—F.Y.

A licence to drive a car also entitles you to drive a motor cycle.

Carrying an Extra Passenger.

Although very well over fifty, I this spring became enamoured of motor cycling, bought your paper and studied the subject, and presently took courage in both hands, bought a 6 h.p. Enfield combination of last year's make, and, thanks to your book and the Enfield handbook, I speedily learned to drive and understand the machine. I find it excellent; but I have a wife and daughter, and so long as one only wants to go we are quite all right, but the difficulty comes in with the third party. We have tried a pillion seat with rather disastrous results, the passenger having a fall, so both go in the sidecar. It is rather rough on the one sat upon. I have noticed a machine with a double Millford sidecar, and I would much appreciate your opinion on this mode of carrying two adults as passengers. Is a 6 h.p. Enfield capable of propelling such a load without straining the engine, and would it surmount all ordinary hills? What is your opinion of the desirability of the use of such a combination?—J.F.K.

The double-seated sidecar should be quite satisfactory, but it is a little rough on your engine. Doubtless, however, it would surmount ordinary hills with this load. If, however, you use a machine designed for two to take three people about, you must not blame the machine should anything happen.

Dressing a Belt.

I shall be glad if you will tell me how to keep a Whittle leather belt in good condition. I have one that has not been in use for some time and has become dry. What shall I dress it with?—G.E.S.

Scrape the links at intervals, and then dress them with collan oil. The thing to do is to keep the leather soft and pliable.

A Choked Jet.

When returning from a ride the engine of my machine suddenly developed the following: It would slow down, nearly stop, and then go on again. Having reached home, I took the engine down, removed all carbon deposit, thoroughly cleaned everything, and ground in the valves. I now find that I can drive on the throttle only, and the least attempt to open the air lever stops the engine. The carburetter is an early type B. and B.—W.H.F.

The tronble is clearly a partial stoppage of the petrol pipe or jet. This would preclude the engine from taking any air. It is just possible, also, that there may be an air-leak in the carburetter or induction pipe unions.

Adjusting the Magneto.

I shall be extremely obliged if you will let me know how to clean the contact breaker, etc., of the Dixie fixed ignition magneto on my 2¾ h.p. Calthorpe-Jap.—F.K.

The adjustment and cleaning of the contact breaker on the fixed ignition Dixie magneto are extremely simple. You have only to pull the contact breaker cover straight off, when the platinum points are exposed. If you wish to expose the contact breaker mechanism further you undo the condenser connection, which you find inside the cover, and the three screws holding on the condenser. This magneto was described in our issue of September 17th, 1914.

READERS REPLIES.

Faulty Lubrication.

If "Greaser" finds the oil pipes are quite clear (which he can test by taking off the crank case cover on the defective side and setting the crank pin vertical and opening the drip feed; the pump will then force oil into crank case if pipes and connections are free), he might try giving the end of the crank a smart blow, as it may be that the packing gland has stuck up. I had a similar trouble with a new machine, and found that a piece of the lip of the piston had been broken out by the head of the screwed bush, which receives the transfer port holding-down screw, having broken off and jammed under the piston. It was found, on returning the engine to the works, that the faces of the packing glands had roughened up through lack of oil, and on these being replaced the supply became equalised again.—Y 1867.

Increasing the Gear Ratio.

With regard to "J.G.'s" query in a recent issue of *The Motor Cycle* as to increasing the gear ratio of his two-stroke James, having had a little experience of this machine, and being the owner of a more powerful two-stroke than his, and having experimented with various gear ratios, I can safely say that "J.G." will be greatly disappointed should he raise his gear higher than 5¼ to 1. The machine will be very little faster on the level, except when there is a strong following wind and running down hill; the engine will get very much hotter when running up long slopes, and will require more oil, and will be very much slower on steep hills, and altogether less flexible. Another disadvantage is that the chains would chatter when starting off and running slowly.—C. S. Roscoe.

EXPERIENCES WANTED.

"W.W." (Hull.)—Paragon folding sidecar. Reliability and ability to pass through a 3ft. doorway.

"R.E.H." (Stafford).—Harcourt radiators on single-cylinder engines, especially P. and M.

"F." (Cape Colony).—1915 A.B.C., Model A. Silence, cleanliness, reliability, and comfort of springing.

"J.H." (Liverpool).—Simms universal motor vulcaniser. Ease of manipulation.

ROUTES.

MANCHESTER TO SALTBURN.—R.M.W.

Manchester, Bury, Accrington, Whalley, Clitheroe, Gisburn, Skipton, Blubberhouses, Harrogate, Knaresborough, Boroughbridge, Thirsk, Tontine Inn, Stokesley, Guisborough, Saltburn. Approximately 129 miles.

TAUNTON TO NORWICH.—R.M.

Taunton, Dunston, Glastonbury, Wells, Radstock, Bath, Chippenham, Wootton Bassett, Swindon, Faringdon, Fyfield, Oxford, Bletchington, Bicester, Buckingham, Stony Stratford, Newport Pagnell, Bedford, St. Neots, Eaton Socon, Cambridge, Newmarket, Thetford, Attleborough, Wymondham, Norwich.

LEICESTER TO MIDHURST.—J.T.

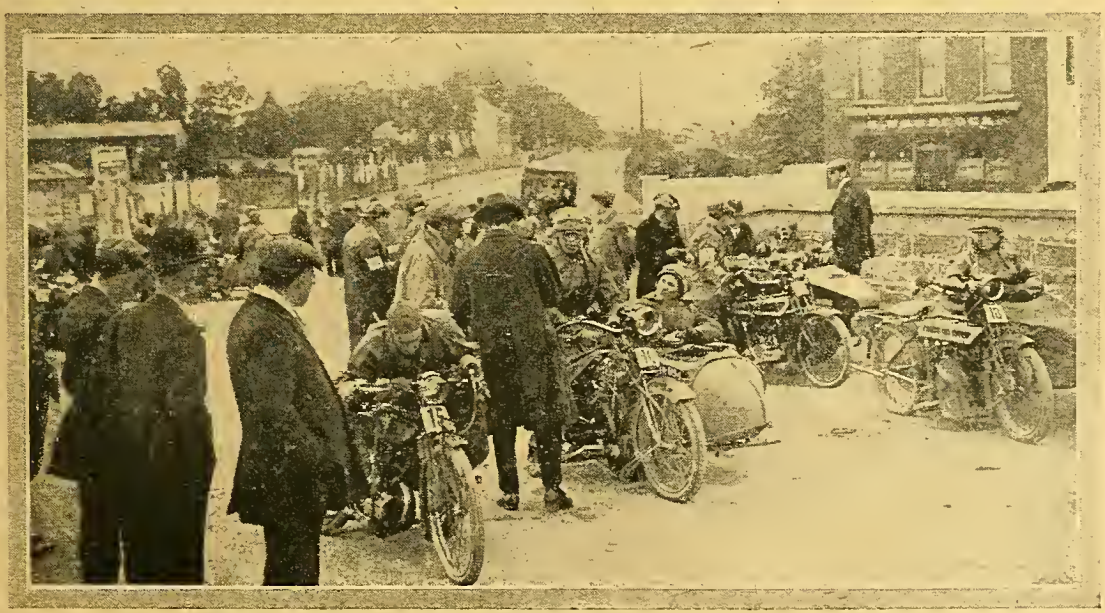
Leicester, Husbands Bosworth, Fenny Stratford, Dunstable, Tring, Chesham, Amersham, Beaconsfield, Slough, Windsor, Ascot, Bagshot, Guildford, Godalming, Milford, Haslemere, Fernhurst, Midhurst. Approximately 179 miles. The road between Godalming and Milford is bad, but it is of fairly short duration.

ASHBY-DE-LA-ZOUCH TO BLACKPOOL.—J.E.

Ashby, Derby, Ashbourne, Leek, Macclesfield, Knutsford, Warrington, Wigan, Preston, Kirkham, Blackpool. Approximately 125 miles.

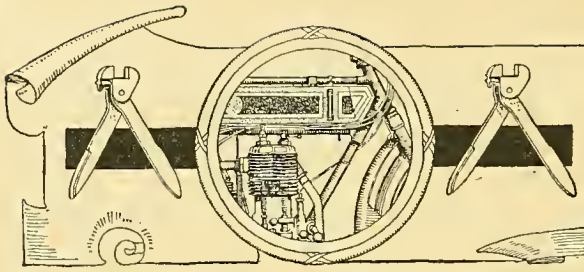
HULL TO CHATHAM.—A.C.

Hull, ferry to New Holland, Brigg, Lincoln, Grantham, Stamford, Stilton, Huntingdon, Cambridge, Bishop's Stortford, Harlow, Chipping Ongar, Brentwood, Ingrave, Tilbury, ferry to Gravesend, Chatham.



SCENE AT THE START OF THE DUBLIN AND DISTRICT M.C.C. TRIAL (reported on page 131 of our last issue).

J. F. A. Day (2¼ h.p. Sun-Vitesse) is just starting, to be followed by C. S. Kettle (4¼ h.p. B.S.A and sidecar).

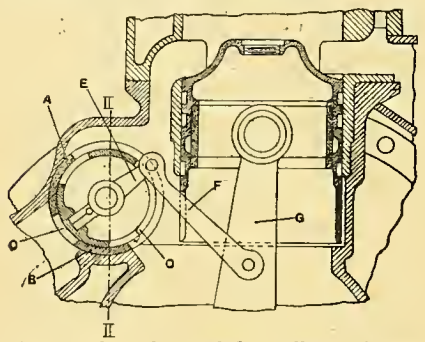


PATENTS.

By ERIC W. WALFORD

An Oscillating Admission Valve.

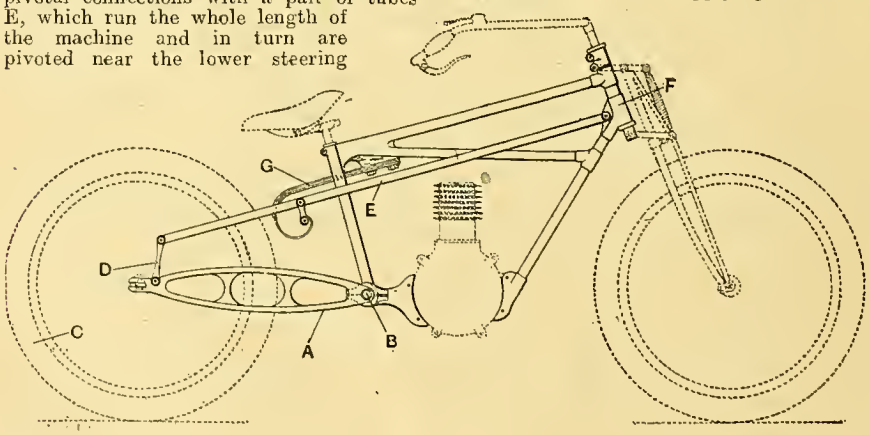
The valve illustrated, which is the invention of the designer of the Scott motor bicycles, is mainly intended for controlling the passage from the carburetter to the crank case of a two-stroke engine. It somewhat resembles the Corliss type used in steam engines, and comprises a sleeve A, within which fits a liner B, ports C and D being formed



which, when in register, allow of the passage of gas into the valve on one side, and out on the other. The liner B is oscillated by a lever E connected by a link F with the connecting rod G, and the link system is so arranged as to give a quick opening and closing of the ports, with a long dwell. Further, this dwell will be longer on the outward stroke than on the inward stroke of the piston, affording a longer pause on the compression than on the suction stroke, so that a high compression ratio is afforded.—A. A. Scott, No. 9,880, 1914.

Rear Spring Suspension.

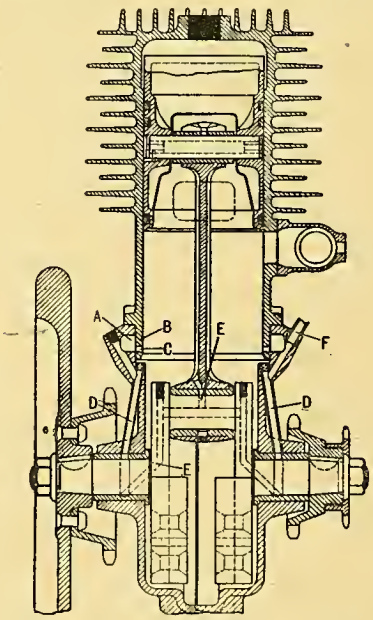
A pair of girder stays A are pivoted at B, and carry the rear wheel C. Projecting upwardly from the rear ends of the stays A are links D, and these have pivotal connections with a pair of tubes E, which run the whole length of the machine and in turn are pivoted near the lower steering



bead ing F. Between the tubes E and the rigid main frames are arranged laminated springs G (or coil springs if preferred), so that a resilient support is provided for the back of the frame. It is not quite clear where the tanks will be located, and the number of pivots is considerable.—W. C. Winterton, No. 2,948, 1915.

Two-stroke Lubrication.

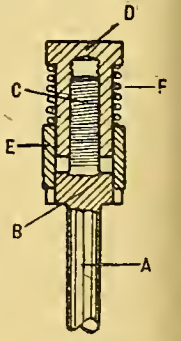
Cast in a suitably enlarged upper part of the crank chamber is an oil groove A, the inner wall of which is formed by the



spigot B of the cylinder. Through the spigot are ports C for supplying oil to the piston walls. To the oil groove A oil is fed by a hand pump through the pipe F. Pipes D lead to the crankshaft bearings and hollow shaft, from which, by centrifugal action, the oil is fed under pressure to the big end bearing through the ducts E. Presumably, it will be necessary, in addition, to maintain a small supply of oil in the crank case in order that the gudgeon pin bearing may be lubricated by splash, but the quantity would be less than usual.—F. A. Kimberley and the James Cycle Co., Ltd., No. 14,896, 1914.

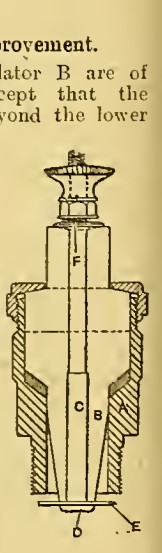
A Simple Adjustable Tappet.

No tools are required to adjust this valve tappet. The tappet stem A is formed with a collar B and a screwed part C on which the tappet head D fits. The collar B is formed with recesses, which are engaged by projections on a sleeve E slidably, but not rotatively, mounted on the head D and impelled downwards by a spring F. Thus, when the sleeve E engages the projections on the collar B the head D is held against rotation, whilst, by raising the sleeve E against the spring, the head can be rotated to adjust its position on the screwed part, thus varying the effective length of the tappet.—C. T. B. Sangster, No. 20,605, 1914.



A Sparking Plug Improvement.

The body A and insulator B are of ordinary construction, except that the latter projects slightly beyond the lower end of the body. The central conductor C passes right through the insulator, and is formed with a head D, between which and the insulator is a plate E forming the inner electrode. The conductor C is held in place by a nut and spring washer F, which allows of expansion and contraction, and adjustment of the spark gap may be effected either by bending the plate E outwards or by inserting packing washers between it and the insulator B.—S. R. Jackaman, No. 14,558. 1914.



THE AUTOMOBILE ENGINEER

Devoted to the theory and practice of AUTOMOBILE CONSTRUCTION.

Published MONTHLY (second Thursday in each month).

Price SIXPENCE NET.

ISSUED in the interests of engineers, designers, draughtsmen, works managers, heads of departments, and all others concerned with the designing and building of motor vehicles, and dealing fully with the technical and manufacturing side of the motor car, utility motor vehicle, and motor cycle industry.

SUBSCRIPTION RATES.

The Automobile Engineer can be supplied direct, if preferred, at the following rates:

Great Britain 9/-, Canada 7/6, other countries abroad 9/-, per annum.

The .. Harcourt Radiators

THE PERFECTION OF AIR-COOLING.

The Harcourt Radiators maintain the full efficiency of engine under the worst conditions: OIL CONSUMPTION HALVED, OVERHEATING ABOLISHED.

WHAT USERS SAY.

MR. E. H. COLLWYN
(Manager Godfrey & Applebee, Ltd.),
Upper Charlton Street, W.,
September 11th, 1914.

"About a month ago I obtained a set of Harcourt Radiators for my little two-stroke motor cycle (Triumph). Since fitting them I have found that the heat is drawn away from the cylinder wall so rapidly that, even when the engine is turning round at about 3,000 revs. a minute, the well-known symptoms of overheating are never noticed."

PRICES: Motor Cycles (singles) 15/-, (twins) 18/-, Cycle Cars 18/-.

Why are manufacturers, one by one, adopting the PILOT **JET?** Type of carburetter

Because

Badcock's By-pass
The Pilot Jet,

Fitted to thousands of carburetters of all types during the last three years, has proved conclusively that a pilot jet is essential for—

(1) A TICK round when idle.
(2) Even pulling at low speeds on top gear
(3) Perfectly easy starting.
(4) Good acceleration.
(5) Economy in petrol, belts, tyres, and mechanism generally.
(6) Maximum results with minimum of air valve manipulation.

Send for interesting booklet on carburation; you will soon send for the By-pass, and add another to my splendid collection of testimonials.

PRICE **10/6.** NO SUCCESS, NO PAY.

This

SPECIAL NOTE

appears on the first page of miscellaneous advertisements in every issue of "The Motor Cycle."

"Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post."

At the present time readers are particularly requested to bear this note in mind.

¶ Owing to the restricted output of new machines, due to the war, there is an exceptionally keen demand for "second-hands," and immediately they are advertised in "The Motor Cycle" there is a rush of purchasers.

¶ Numerous letters are reaching the office of "The Motor Cycle" from advertisers in these columns who state that they are inundated with replies, and easily effect a sale within a few hours of the advertisement appearing.

THIS is, of course, easy to understand when it is remembered that "The Motor Cycle" has an exceptionally large circulation — far greater than any similar journal — and is read by all motor cyclists and new comers to the pastime.

The certified figures published recently showed the circulation of "The Motor Cycle" to be over

70,000 Weekly,

but this figure is now being **very greatly exceeded** every week.

If you want quick and satisfactory

MOTOR CYCLES FOR SALE.

Wolf.

WOLF, 2¼h.p., 3-speed, kick starter, clutch model, Stelastic back tyre, in new condition, done 1,000 miles: £24.—F. Keen, Whielden St., Amersham, Bucks. [9805

2¼h.p. 1911 Wolf, outside flywheel, T.T. bars, low, powerful, Bosch, B. and B., engine re-bushed, everything splendid order; great bargain, £13.—Micky, 69, Ridge St., Watford. [X3592

Yale.

YALE, 1914, 2-speed, with Swan coachbuilt sidecar; £55.—Martin, 33, Gillingham St., S.W. [9804

YALE Motor Cycle in stock, 8h.p., 2-speed, kick start; 60 gns.—Jones, The Broadway, Muswell Hill. Sole agent for N. London, trade and retail. 'Phone: Hornsey 2562. [7636

Zenith.

3½h.p. Zenith-Gradua, as new, plating, enamel perfect; bargain, £40.—Timmons, Mansfield. [X3573a

ZENITH, 1915, and sidecar, countershaft, demonstration model; £75.—Lucas, Garage, Mansfield. [X3401

8h.p. Zenith, red, countershaft, £21 Montgomery sidecar, accessories; £65.—7, Pembridge Villas, London. [9719

1912 3½h.p. Zenith-Gradua and Coach Sidecar, good condition; £28.—Westwood, St. Paul's Schools, Mill Hill, N.W. [X3636

ZENITH-GRADUA, 3,000 miles, excellent condition; nearest £35.—Holte, 21, Old Deer Park Gardens, Richmond, S.W. (9539

1913 Zenith, 6h.p., and cane sidecar, in excellent condition, and all accessories; £38.—Seen 223, High Rd., Kilburn, N.W. [9670

RACING 1914¾ 8-10h.p. m.o.o.v. Zenith and Scott-Westall sidecar, very fast, green finish, heaps of spares; £72.—Gilbert Hall, Matlock. [X3138

ZENITH-GRADUA, late 1912, J.A.P. engine, variable gear, with nice cane sidecar and lamps, lovely condition; £38.—Moss, Wem. [X3607

1912 6h.p. Zenith-Gradua, in splendid condition, tyres and belt as new, fine goer; great bargain, 35 gns.—Julian, Broad St., Reading. 'Phone: 1024. [X3558

ZENITH, 6h.p., 1913, Gradua gear, C.B. sidecar, speedometer, 3 lamps, new tyres, spare tyre; £38; perfect condition.—F.G.B., c/o 86, Bouodary Rd., East Ham. [9779

1913 Zenith, 3½h.p. J.A.P., F.R.S., Stuart, splendid going order, done 1,327 miles, new Dunlop belt, good tyres, sidecar; £25.—Stovell, Ironmonger, Hall St., Stockport. [X3450

ZENITH-GRADUA, 6h.p., clutch, with Bramble sidecar, hood, screen, as new, 1915; £63; owner buying car.—Box LI,105, *The Motor Cycle* Offices, 20, Tudor St., E.C. [9890

3½h.p. Zenith, 1910, and Millford wicker sidecar, splendid running order, well tyred; accept £25, or near offer; real bargain.—7, Stanhope Rd., Sidcup. Seen after 7 p.m. [X3322

6h.p. Zenith Combination, late 1914, almost new, countershaft, kick starter, speedometer, fully equipped, guaranteed; £70.—Percy and Co., 337, Euston Rd., London. [9874

ZENITH, 4h.p., Gradua gear, 1913 engine, running perfectly, new belt and tyres throughout, all parts in good order, accessories; £35.—Richardson, Post Office, Union Rd., Rotherhithe. [9911

ZENITH Gradua 1915 Models in Stock.—3½h.p. twin model B 59 gns., 4-5h.p. model D 62 gns., 8h.p. model H 73 gns, plus 5% increase; sidecars in stock; exchanges, extended terms.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0491

Ladies' Machines.

LADY'S Humber, 2h.p., free engine, pedal starting, in absolutely new condition; £22.—Alexander's, 115, Lothian Rd., Edinburgh. [9399

1915 Royal Ruby, ladies' model, head light, generator, horn, etc., as new; £23/10.—Write, Rex Mundy, 19, Grafton Mews, Warren St., W. [9838

LADY'S Connaught, 1915, 2½h.p., 3-speed, kick start, lamp, horn, accessories, insurance, run 300 miles.—Motorist, White Stone Farm, Nuneaton. [X3441

Miscellaneous.

3½h.p. 1911 B.S.A., in perfect condition, and tyres nearly new; £20.

3½h.p. 1908 Triumph, recently overhauled, condition good; £14/10.—Pytchley Garage, Banbury. [9605

4h.p. Campion-Jap, £22; 4¼h.p. Precision, £23; both 1913.—Corpl. French, Fenny Stratford. [X3214

150 Motor Cycles and light cars for sale; low cash prices.—Motories, 68, Horton St., Halifax. [0708

FOR a good, cheap motor cycle, see Morgan and Maxwell, The London Motor Mart, 80, High Rd., Streatham, and branches. [X3512

IF You Want Bargains in second-hand motor cycles you can get them at Wauchope's (cash or easy terms), 9, Shoe Lane, Fleet St., London. [2000

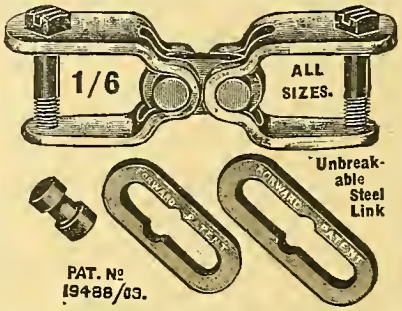
SECOND-HAND Motor Cycles.—We have a large stock of machines in excellent condition at very low prices to clear; send us your requirements and we will guarantee to satisfy you.—The Morris Garages, Oxford. [0314

OVERSEA RIDERS

Should insist on

"FORWARD" BRITISH FASTENERS

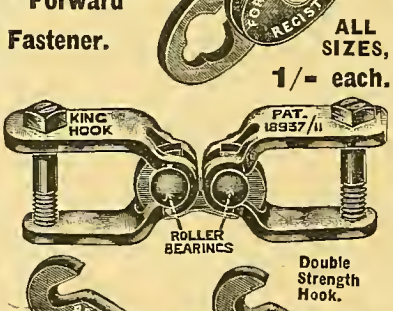
As fitted by all the leading makers.



"FORWARD," the World's most popular Fastener. Fitted with Unbreakable Steel Links, which cannot break or come apart in use.

"FORWARD" LEATHER LINK, for use with the "Forward" Fastener.

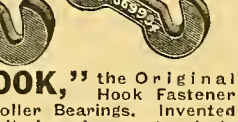
ALL SIZES, 1/- each.



"KING HOOK," the Original Hook Fastener with Flanged Roller Bearings. Invented by us in 1911, it has been extensively copied but never equalled.

1/- detachable, 1/3 adjustable.

"KING HOOK" Leather Link 10d. each.



All sizes.

"CHAMPION KNUT," a popular Fastener at a popular price. Wonderful value.

9d. detachable. 1/- adjustable.

FORWARD MOTOR CO.,

SUMMER ROW, BIRMINGHAM.

MOTOR CYCLES FOR SALE.

Miscellaneous.

HEBDEN'S Have in Stock:

1915 Enfields, 8h.p. and 6h.p. combinations, 3h.p. and 2¼h.p. lightweights.

1915 Indians, 3½h.p., 5h.p., and 7h.p., with or without sidecar.

1915 James, 4¼h.p. 3-speed combinations and 2¼ h.p. 2-stroke 2-speed.

1915 Wolf-Peco, 2¼h.p., 2-stroke, 2-speed; £33.

1915 Wolf, 2½-3h.p., 2-stroke, 2-speed; £31.

1915 New Imperial-Jap, 2½h.p., 2-speed; £34.

1915 Wolf, 2½-3h.p., 2-speed, 2-stroke, not run 300 miles, as new; £27, complete.

1915 Enfield 8h.p. Motor and Sidecar, fit with hood, screen, Lucas head lamp, 70/- set Lucas rear light, horn, sidecar lamp, guaranteed as new, not run 300 miles; cost £98, accept £90.

2¼h.p. Motosacoche, fit with new Senspray, mag., perfect; £12, a gift.

1914 Enfield 6h.p. Motor and Sidecar, complete as new; offers.

1912 Humber, 3½h.p., 2-speed, 1914 engine, new Canuelet sidecar; £38.

1912 5-6h.p. Clyno and Sidecar, 2-speed; a bargain, £39.

1912 Enfield, 2¾h.p., 2-speed, complete; a bargain, £23.

1912 5h.p. F.N., 4-cyl., 2-speed, and sidecar, perfect; £19.

1915 New 10h.p. Singer Car, dynamo lighting set dickey seat.

1915 New Humberette 2-seat. Car, 8-10h.p., 3-speed and reverse, non-skid tyres on back; best offer accepted.

1915 New Williamson Cycle Car, 2-seat., 8h.p., 3-speed, water-cooled; £120.

HEBDEN'S Motor Mart, St. James St., Burnley Tel.: 488. [9854

PALMER'S Garage and Motor Auction Rooms, 183, 185, 187, 189, High St., Tooting.

PALMER'S Garage, Tooting.—The pre-eminent place for purchasing motor cycles and accessories Auctions fortnightly.

PALMER'S Garage, Tooting.—3h.p. Rex, low built, fast, engine just re-bushed; £8.

PALMER'S Garage, Tooting.—3h.p. 1913-14 Royal Enfield twin, 2-speed countershaft, lightweight as new; £37/10.

PALMER'S Garage, Tooting.—3½-4h.p. 1914-5 Douglas combination, as new, tyres hardly scratched £75.

PALMER'S Garage, Tooting.—2¾h.p. N.S.U. twin lightweight, 2 speeds, F.E.; £17/10.

PALMER'S Garage, Tooting.—2½h.p. Minerva, £4 4½h.p. F.N., 4 cyls, £10.

PALMER'S Garage, Tooting.—3¾h.p. Scott, 2-stroke 2 speeds, 2 cyls., 1913 late model, as new; £37/10

PALMER'S Garage, Tooting.—2¾h.p. nearly new Levis lightweight de luxe, 2 speeds, 2-stroke; £35.

PALMER'S Garage, Tooting.—3½h.p. Humber, 2-speed £18; 3½h.p. Premier, 2-speed, £25.

PALMER'S Garage, Tooting.—7-9h.p. Bat-Jap, 2 speed, £20; 3½h.p. Centaur, £10; 3½h.p. Fafnir £12/10.

PALMER'S Garage, Tooting.—Write at once for illustrated dual catalogue of auction sale containing also over 50 photographic illustrations of automobiles in stock. [9483

EAGLES.—James, 3½h.p. 1914 twin, 2-speed, counter shaft gear, kick starter, enclosed chain drive, T.T handle-bars, all accessories, new condition; £47/10.

EAGLES.—N.S.U. 3h.p. twin, 1914, loop frame, rear springing, 2 speeds, free engine, kick-starter, foot boards, Dunlop heavy tyres; £35.

EAGLES.—Rover, 3½h.p., 1914, 3-speed model, with footboards, front and rear lamps, accessories; £42

EAGLES.—Bat-Jap, 8h.p. twin, 1911-12 model, 2 speed gear, free engine, spring frame; £29/10.

EAGLES.—N.S.U., 6h.p. twin, 2 speeds, free engine Kempshall tyres, footboards, coachbuilt sidecar any trial; £28/10.

EAGLES.—Precision, 4¼h.p., 1913, 2-speed, countershaft gear, kick-starter, chain and belt drive coachbuilt sidecar; £39.

EAGLES.—N.S.U., 3½h.p., 1912, model de luxe (85×88), Amac latest carburetter, N.S.U. 3 speeds, adjustable pulley; £25.

EAGLES.—Douglas, 1912 2-speed model, semi T.T handle-bars, excellent condition; £28.

EAGLES.—Any of the above can be had on approval, "The Motor Cycle" deposit system.—Eagles and Co., High St., Acton. Tel.: 556 Chiswick [X349

Our Oversea Trade.

SOME few months ago we hinted that if it were found impossible to obtain a sufficient supply of munitions for the British and Allied armies without encroaching further upon home motor manufacturers, a valuable trade would be lost to this country. Subsequent developments are still fresh in everyone's mind. It was found that the whole engineering trade must be mobilised in order to maintain the necessary supply of munitions, notwithstanding the serious and permanent damage which might be caused to the Overseas motor trade of this country, at a time, too, when exports of costly articles is most desired in order to counterbalance to some extent the immense value of our imports, and thus maintain the country's financial equilibrium. How unfortunate this state of affairs is can best be gauged by a comparison of the values of imports and exports, and especially during the first six months of this year. In this period we have bought £429,000,000 of goods from other countries and only sold them £235,000,000 worth; that means to say that each day we have been buying from them just over £1,000,000 worth of goods more than they have bought from us.

The July returns show that British exports of motor cycles and parts just succeeded in surpassing the value of our imports, but we fear it may be for the last time until there is some real change in the need for munitions. This is disturbing to any patriotic Britisher who has watched our motor cycle exports quadruple themselves slowly but surely in the course of a few years.

But as a set off to this, a letter such as we print in our correspondence columns this week is, in its turn, most refreshing. A Pretorian reader tells us that a group of acquaintances of his draw lots as to who shall take the few precious British-made mounts arriving in that quarter, and we have no doubt that in other Overseas dominions where British material and care and attention to detail are appreciated, the same longing for the home product is manifest.

This enthusiasm for British mounts should, after peace is declared, very quickly help to regain for our products the pre-eminence they have obtained throughout the world, and it will be some consolation to those manufacturers who, having placed their country's call in the forefront, have to stand by helplessly and see our American cousins profit. In this connection it must not be overlooked that there are thousands of agents who make their livelihood from the sale of motor cycles, and, consequently, if no British products are forthcoming, it can hardly be expected that they shall eschew any connection with foreign-built machines, or rashly be deemed unpatriotic for not so doing. The same sentiment must after all apply to users. Truly, the most effective form of economy in the present crisis is to prevent money going out of this country; on the other hand, a free circulation of money in this country is generally considered to be "good for trade."

All things considered, however, it is a remarkable achievement for the home manufacturers to have exported 11,506 motor cycles during the seven months ended July 31st as against 12,998 in the corresponding period of last year and 15,107 during 1913, the values with tyres and parts representing £185,285, £284,422, and £309,806 respectively.

Nothing apparently has come of the suggestion which was ventilated in these columns some time ago to release a certain proportion of the motor cycles produced in this country for the use of the Army and replace them with machines of American manufacture. Such a scheme, it will be obvious, would enable our firms to keep up their business connections and so more easily pick up the threads of trade when they are in the happy position of being able to cope with all demands.

An index to the advertisements in this issue will be found on the page facing the back cover.

DETAIL ALTERATIONS THAT HAVE IMPROVED AN ALWAYS SATISFACTORY MACHINE.

AN enthusiastic private owner of a Morgan runabout, who hails from Liverpool, has sent us the following account of the alterations and improvements which he has had carried out, and which we feel sure will be of interest to all owners of these handy little vehicles. He writes: "I consider that there is no car made which is beyond criticism, and that the Morgan, although it is not perfect, is, I should imagine, perfectly fool proof. The following ideas which I have had carried out on my Grand Prix type Morgan at a very small outlay in money have well repaid me for the time and trouble expended.

Difficult Starting.

"In the first place I found that starting up the engine either in summer or winter was none too easy, for at times, especially in the cold weather, the starting handle grip is apt to make one's hands sore, as the wooden handle grip is stationary on the starting handle instead of being made to revolve, as is the usual practice on all cars. A remedy for this drawback is a loose wooden handle fitted over the existing grip. When the engine is hard to start in cold weather I have found it due to condensation and freezing taking place in the induction pipe. Also owing to the length of this pipe, it is very seldom that good results are obtained with benzole in the winter months. A big improvement in this direction will be noticed, if the induction pipe is well wrapped up with flannel secured with insulating tape.

A Clutch Improvement.

"It is a well-known fact that a leather-lined clutch is apt to become harsh in a comparatively short mileage unless entirely enclosed as on cars, and no matter how liberally it is dressed with oil the drive is never taken up smoothly. With a Morgan clutch, which is leather-lined, it certainly is a great advantage to substitute for the existing lining either a Raybestos or Ferodo lining, either of which will give as sweet a pick up as can be obtained with a first-class plate clutch, and, moreover, either lining will certainly outlast the car, whilst the saving in wear and tear in the transmission system and on the back tyre is most marked.

"With either of these clutch linings fitted the only attention needed is a dose of paraffin approximately every two months to clear away any road dust which may have been picked up, after which it is advisable to spread a little oil over the surfaces.

"Whilst on the clutch question, it is a good tip to procure a stick long enough to reach from the clutch pedal to the seats, then to cut a groove in one end, and after pushing out the clutch hold it out with the stick as a wedge. The clutch surfaces can then be very conveniently and readily inspected when an occasion arises.

"It is not infrequently necessary to check the track of the front wheels, for in the event of the track being out, increased wear is taking place in the front tyres, not to mention an annoying pull on the steering wheel, which needs constantly correcting.

"Personally, I have been very immune from the puncture fiend, and this good-luck I attribute largely to the use of oversize tyres on all three wheels. When the car was delivered new I noticed that 650 × 65 mm. tyres were fitted as standard, and these I replaced with 700 × 85 mm. tyres, which, although larger in size, fitted the existing rims quite accurately. Now, after covering a season's mileage of 5,000 miles on these tyres, I do not regret my decision in any way, for I have not had any necessity to worry over tyre troubles in any way.

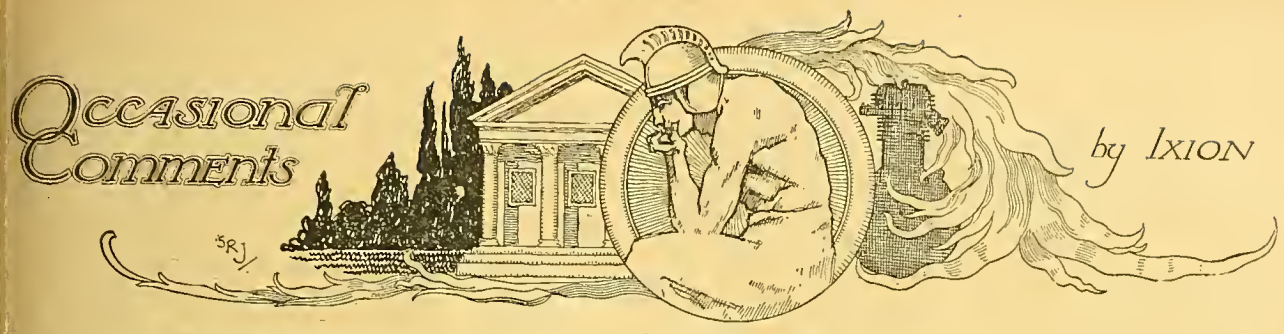
A Tank Tip.

"The petrol tank on my Grand Prix Morgan gave me some trouble with petrol leakage after covering the first 1,000 miles. This I attributed to the excessive vibration set up in the whole car when travelling at speed over vile road surfaces, and also to the shape of the tank, which is unusually long and minus any central supports under the bottom.

"This trouble, I found, can be completely overcome by fitting angle irons under the tank attached to the dashboard, thus effectively eliminating any tendency for the tank to vibrate or chatter.

"Another point which is well worth attention is the fitting of leather flaps to the mudguards to save the sides of the body and the passengers' arms from being covered with mud. Also I have found that with constantly getting in and out of the car the steering wheel is apt to become badly scratched by one's feet. This I have remedied by wrapping the wheel tighter with thin picture cord, which not only is of pleasing appearance, but enables the driver to obtain a good grip.

"In addition to the speedometer and watch fitted, I have added a useful refinement to the dashboard in the shape of a small electric light over the oil drip feed lubricator, which I find is a great convenience when driving at night, for, of course, varying temperatures affect the flow of oil considerably." F. REES.



Well-fitted Tool-kits.

Several correspondents write in praise of various makers' tool-kits, notably the Sunbeam, Victoria, Douglas, and Motosacoche. One reader informs me that similar variations exist in respect of cycle car and light car kits, and that in a lengthy and representative experience he has found that French makers cater for the user's needs more adequately than our home firms. British manufacturers please read, mark, learn, and inwardly digest.

Where the Battery should be.

Readers may remember that I am busily "trying out" a couple of dynamo lighting sets, designed for solo use. Each designer tackles the problem of battery storage in a different way, the F.R.S. putting it within a tin cylinder in prongs projecting rearwards from the lamp bracket, while the Motosacoche mounts it in a rectangular tin box on the near side footboard. Neither position is ideal. The Motosacoche notion will obviously add to the repair bill if the machine sustains a left-handed tumble, and it necessitates the presence of four lengthy wires in rather an exposed position. The F.R.S. idea is probably the best that can be devised so long as motor cycle makers make no provision whatever for the storage of accumulators; the only sound alternative is a platform above a countershaft gear box, where it would be in the way of chain adjustments. But eventually, one would imagine, the proper place will be identified as a platform brazed to the top tube of the frame, in the position where Norton and one or two other machines have their toolbags. Here the accumulator would be quite out of harm's way. It could not interfere with any other part; my F.R.S. accumulator leaves no room for mounting a speedometer near the centre of the bar, nor can the prongs be lengthened rearwards without obstructing access to the gear lever. Further, the wiring could be run very neatly along the top tube. This improvement is obviously outside the range of the electricians. It must be carried out by the motor cycle makers, and will only materialise when the majority of buyers specify electric lighting. Then the trade will tardily recognise the problem of battery storage and make allowances for it.

Valve Breakages and the Use of the Clutch.

A reader sends me his confession, to the effect that he is in the habit of running his engine declutched, *e.g.*, at level crossings, and enquires whether the practice is to blame for the fact that during the last three months he has broken two inlet valves (at the cotter hole) and one exhaust valve (at the junction of head and stem), the valve guide being simultaneously broken in each case. I cannot answer his question dogmatically, seeing that I have no personal experience of the latest model engine of the make to which my correspondent's remarks refer; but as I have had no complaints whatever of the valves on this engine, I suspect that he has been using his free engine to excess, and that he must ascribe his troubles mainly to this cause. His letter astonishes me, because I have never yet broken a mechanical inlet valve. It looks to me as if the valve stem had seized in the guide by reason of overheating in each case, and that when the tappet next ascended after the seizure, the valve snapped at the weakest point; in the case of the inlet valve (the stem of which normally keeps fairly cool), the cotter hole would be the weak point; in the exhaust valve, an overheated and scaled neck might well be weaker than the cotter hole. The engine in question is an admirable slow runner, a feature which almost invariably implies close fitting valve necks and a consequent absence of air leaks past the guide. But I cannot be certain, because it is possible that the firm in question has not got its latest valves dead right, and my correspondent gives no exact information about the amount of declutched running to which he subjects his engine. Generally speaking, a machine should not be run on free engine for a single avoidable second, and if this rule is followed subsequent trouble will be avoided.

Petrol Economy.

A Leeds reader speaks enthusiastically of a tip given him by a colliery engineer a few weeks ago. He was complaining that his 3¾ h.p. sidecar outfit could do no better than 50 m.p.g. under the most favourable conditions. His auditor went into the pit stores, and produced three small copper washers, of various weights, for putting on top of the float. The lightest washer was first tried, and resulted in an immediate stoppage of petrol spraying from the air intake, improved power, and lower consumption. Then the middleweight washer went in, and the fuel economy was raised to 70 m.p.g. With either washer, starting was as easy as usual. This is an interesting experience, though it by no means follows that the remedy will prove efficacious in all cases. It is obvious that the petrol level was badly out prior to the employment of washers; and the real interest of the suggestion lies in the claim that alteration of the petrol level stops petrol spraying from the air intake, a nuisance for which I have never found a radical cure, though an air extension pipe is good. I shall verify this point very carefully as soon as I strike a machine which sins in this direction; but at present I see no technical explanation of the claim, and suspend my judgment.

A.

The Sporting Side of Motor Cycling.

By ROAD RIDER.

THE essence of sport is difficulty, and the pleasure of all sport consists of triumphing over difficulties—difficulties which, in many cases, include personal risk. So the sporting side of motor cycling is not necessarily limited to racing on specially built trade machines; it may be enjoyed by any rider who sets himself tasks which cannot easily be performed, and it may range from winning a T.T. or a Brooklands event on the one hand to successful touring on a single-geared machine picked up for a ten pound note from a garage scrap heap and adapted at home by a clever but impecunious owner. Under my definition, I am bound to include in the sporting aspects—(1) competition work of all kinds, where the difficulty lies in surpassing rivals, (2) grease riding, (3) night riding, (4) crock driving, (5) driving single-geared machines in bad country, and (6) freak hill work.

It is impossible to deal with the delights of all these sub-aspects of sporting riding in a single article, and I propose to confine myself especially to the joys of touring on a single-geared machine, which, even if modern in design, must be in absolute "nick" to get the rider round a well-planned tour, especially if the weather breaks and grease adds terror to the hairpin bends of the bad hills, which must in any case be taken at speed. I must have covered a distance approaching 250,000 miles since I took my first ride with a petrol engine, and, of all the jaunts stored in my memory, there were none I enjoyed better than those in Devon or Scotland on a low-powered single-geared roadster or on a high-geared direct driven twin, minus a variable gear. A visit to all the beauty spots of North Devon on a 5-6 h.p. single-geared Bat is full of thrills for the driver who is sporting at heart; and quite the most interesting moments of the 1914 Scottish Trials were those when sundry dauntless men, mounted on grossly over-geared single-cylinders, attempted to round the V bends of the test hills at speed with their inside shoulder almost in contact with the bank or wall on the crook of the corner.

Weight must be Reduced.

For all such jobs, of course, you must ride light. You are content with ordinary walking kit, plus a suit of featherweight oilskins, serving the combined purpose of dust and rain kit, and with a tooth brush and razor in your pocket. Other men may carry two panniers, and a Brooks case and spare cover on the pannier. For you stern necessity confines the repair kit to the tyre outfit, a 4in. King Dick, a pocket screwdriver, a belt fastener, a sparking plug, and a valve cap spanner. What doesn't go in your pocket will go in a military hairbrush case, lashed where the front fork joins the front mudguard. 1,000 feet beam head lamps are an outrage for such as you; your lamp and generator cost 8s. 6d., and weigh 2 lb. or so; a "pip-squeak," taped to the steering bar, replaces the usual enormous bulb hooter; it is astonishing how much more life a mount has when you keep its load down.

Secondly, you must pick your road from a contour map, or, better still, from a half-inch ordnance, coloured to show where the high spots come. A little practice and an eagle eye will soon detect the places where the country rises sheer for 500 feet in less than a mile; the half-inch map will show the by-roads, and if the main highways are cunningly graded over shoulders, and round wide sweeping corners, you will soon spot a scarcely marked cart track, that will ask for three or four shots before you burble up to the summit. On jaunts like these it does not particularly matter whether your machine be a single-geared 6 h.p. or a standard 2¾ h.p. variably geared roadster; in either case freak climbing will cause you trouble of an equal order, but the faster mount offers more thrills per square mile or per hairpin.

The Joys of Tuning.

Then comes the tuning. A week at an inn like the small hostelry at the top of Countisbury with a machine which either has a single gear or a single figure bottom gear will teach the sporting aspirant more about tuning than five years of pottering in an ordinary district. If he takes a solemn vow to master each hill which worsts him at the first attempt, he will go home an infinitely wiser man. His grease-riding will improve till he loses all sense of fear—that is, if rain falls, and you can count on it within a week in all hilly corners of the British Isles. His corner work will be absolutely transformed; on the first day he will slide up towards the abrupt reverse bend with his valve lifted, his heart a-flutter, and his eyes staring. Three days later he will storm up to it all out, jam on his brakes, haul the machine violently round, correct its skid, lean over nearly flat, let his engine in with a bang, make a couple of lightning dabs at his air and throttle, and shoot up to the summit in a cloud of dust and a rosy halo of glory and envious admiration.

Let the novice try the hills in and out of Parracombe, on a wet day, with one gear; or even better, perhaps, let him take the road from Barnstaple to Lynmouth, *viâ* Loxhore, and see what he can make of the little-known, but quite trying one-gear climb up Loxhore,

The Sporting Side of Motor Cycling.—

which many of the veterans had to ascend somehow on 2¾ h.p. machines geared 4¼ to 1 ten or twelve years ago.

A few failures will set him virulently experimenting with his engine compression—he will grow a hawk-eye for leaks; he will come to know the difference which a 10 lb. stronger spring on the inlet valve can make with some engines; he will realise the kind of carburetter

A mill of somewhat unusual and pleasing design at Chesterton, Warwickshire.

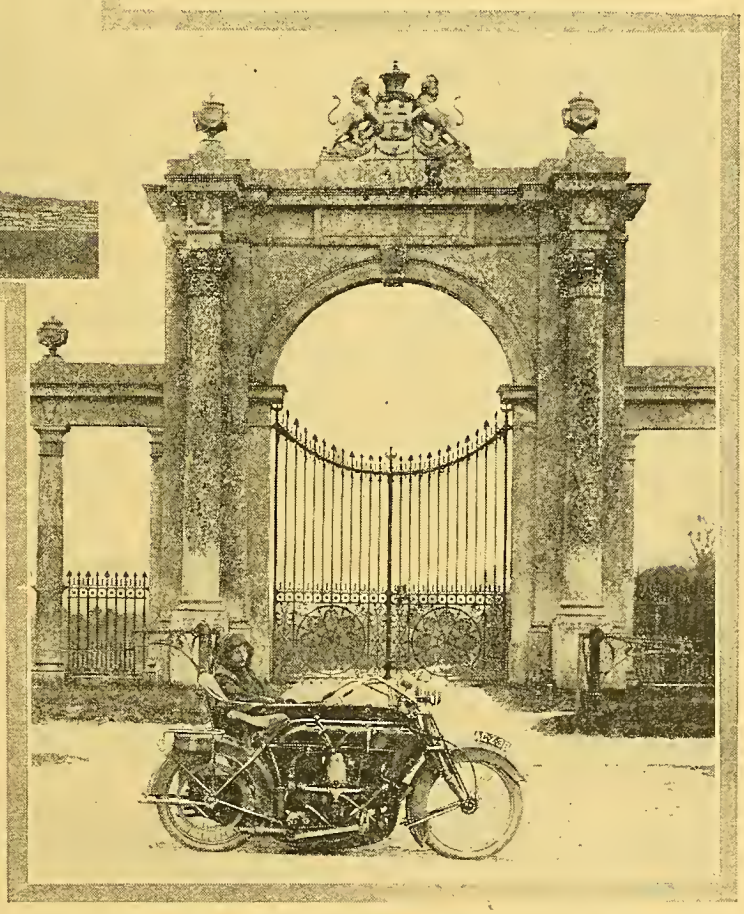
adjustment which gives a strong puff of gas when the engine is barely turning over at all; he will understand the unique vim which the maximum position of a magneto armature can afford provided that maximum is timed at the correct moment of the piston stroke.

The Final Touches.

When these elementary points have been mastered, he will sigh, if his pocket and tools permit, for a genuine semi-racing engine. We shall hear of him drilling holes in his piston and connecting rod, or fitting a light steel piston—a Zephyr or a Simplex, maybe, with a steel filigree connecting rod to match. Then delving into the mysteries of engine balance—swinging his crankshaft on a couple of knife edges, and carving weight out of its rim; studying dial diagrams of valve timing, and sending an order for a special cam or two to be machined up; then dropping his gear a trifle to get the benefit of the extra r.p.m. after rounding a hair-pin, until at last nobody in his district can make a similar machine keep in sight of his.

Anon, an Expert Competition Rider.

The next year we shall see him in the Six Day Trials taking the bad hills like a master, and at a speed which even the factory-nursed trade riders view with real envy. He was in the last trial, too, perhaps; but then he rode a standard agency-bought mount, with its bottom gear dropped 25% by dint of a special sprocket, or the like; and even at that he was nervous and clumsy on the test hills; this year he has standard gears, and he very seldom engages bottom, for he has learnt how to make a machine go. While other riders talk excitedly in hotels at night of the morrow's timed climb, or scan the skies anxiously for fear of rain along a soft bit, he is calm and collected; he is master of his job, and the only thing he is up against is his luck. He knows he can get over the course if the machine treats him decently, and even if a tyre goes or a valve snaps at an awkward moment when he has none too much time to spare and a tricky bit of road to scrap over, the odds are that he will get in somehow; for he is a sportsman, and welcomes difficulties, believing that they were only made to surmount, and determines to surmount them at all costs.



A 6 h.p. Humber sidecar outside the imposing entrance to Sir W. Escott's residence near Towcester.

Reliability, Simplicity, and Accessibility.

THEIR RELATIONSHIP AND A FEW SUGGESTIONS.

PART II.—Concluded from page 149 of last week's issue.

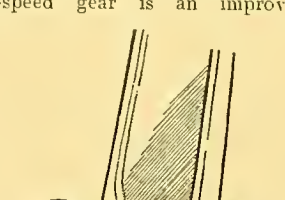
LAST week we dealt with the relationship of reliability, simplicity, and accessibility, and included a few suggestions as to where engine construction might possibly be improved in these respects. This week further ideas are put forward relating to other, though almost equally important, parts of the machine.

Gears.

Gears are a much vexed subject. Provided a countershaft gear is well designed and made, has short shafts, ample bearing surfaces, a large filling orifice, oil-retaining glands, and a minimum of projections, the actual details are not of the first importance.

The writer prefers fine pitch teeth with a wide surface to narrow coarse pitch gears, and prefers also that the engine and gear box be made in one unit on the lines of the late 2¾ h.p. Villiers or the two-stroke Clyno and some Singer models. This form of construction is, however, unusual, and has certain disadvantages unless it is very well carried out.

For ordinary solo touring work two speeds will suffice, provided the top gear is reasonably low, and there is not too big a jump between the high and low ratios. A flexible 3½ h.p. single should be capable of any reasonable tour with gears of about 4¾ to 1 and 7½ to 1. A three-speed gear is an improvement;



An adjustable big end bearing. The thick black line represents a brass packing strip. Note the method of fixing the nut with bent sheet metal.

even for solo work it is very pleasant to have a high top gear of about 5¾ or 4 to 1, a middle of about 6 or 6½, and an emergency low gear of 9 or 10 to 1. For sidecar work three speeds are almost essential if heavy touring is to be undertaken, and, in any case, a good clutch should be fitted. The dry plate type of clutch is so simple and effective that it would be hard to beat, though the multi-plate type is very satisfactory and has many staunch adherents. The chief defects of the latter type are a tendency to "drag" when disengaged, and the fact that a certain amount of cleaning out is necessary every now and then.

Transmission.

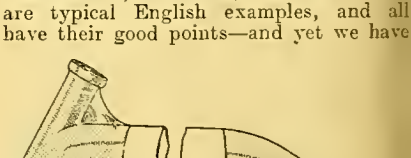
If the unit engine and gear box system be employed, or if the gear box be located very close to the engine, a silent chain front drive is ideal, as this type of chain is more suitable to the high speed at which it has to run. In any case, the front drive should be totally enclosed in an oil bath, and sheet metal is not the best material for use in this place. Firstly, sheet metal is apt to be bent and to rattle; and, secondly, it is hard to fix a sheet metal case so that it is rigid when in position and yet quickly detachable. A light aluminium casting split horizontally is hard to beat, but it is essential that provision for fixing this case is made in the original design of both crank case and gear box. Nothing could be more unsightly or more unmechanical than the strips of metal and odd bits of tin by which the majority of chain cases are attached. Some machines are a disgrace to their builders and designers in this respect.

The rear drive, if by belt, should be longer than is usually the case; and if it be impossible for certain reasons to carry the gear box well forward, the final drive should be by roller chain, a good shock absorber being incorporated somewhere in the drive. The rear chain need not be enclosed, but should be protected from mud dripping from above.

Frame Design.

So much has been written on this subject that the writer is somewhat chary of raising the question again, especially as his views are somewhat unorthodox. However, we all hold our own peculiar opinions, and this one may be of interest. The loop frame is specified because it relieves the crank case of much strain, and generally stiffens the construction; and a top tube tank on the lines of the Premier two-stroke is chosen for several reasons. Firstly, the frame is easy to clean, there being no crevices between tube and tank and filler caps; secondly, the construction (in quantities) is cheap; and, thirdly, it is eminently strong and removes the objection of the dropped top tube, as the drop would take place in the powerful rear lug group. All tubes in the frame should be as straight as possible (the bend in the loop frame is unavoidable, and gives a stronger construction than no tube at all).

Spring frames are a necessity for Colonial work, and would be a boon even on our comparatively good roads. This is difficult ground, for where is the perfect spring frame? There are, indeed, several good spring frames (by which sprung rear wheels are meant), and the Indian is amongst the finest examples. The A.B.C., the P.V., and the Wooler are typical English examples, and all have their good points—and yet we have



Tubular tank construction, showing two lug groups.

some way to go to find perfection in this respect, for joints exposed to mud and grit, incorrect pivot centres and unequal sized driving sprockets all require attention. It is true that these spring frames are a great improvement over the rigid frame, for, apart from the extra comfort, they cure much more serious faults than they introduce, and from the point of view of reliability they are of the utmost value in saving the mechanism from sudden shocks. The Bat and Edmund type of spring frame, in which the rider is sprung from the machine, have much to recommend them from the comfort view point, but they hardly affect the title of these notes.

Wheels.

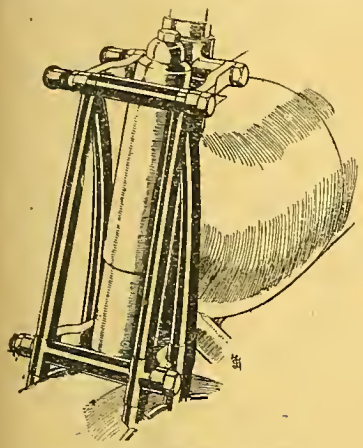
Rims, spokes and hubs are all important features, especially to those who live in districts where bad roads are the general rule. Rims, besides being of standard section, should be rustless and easy to clean. With regard to rustproof rims, the Roman aluminium alloy rim is absolutely rustproof and very strong in construction. These rims can be fitted to any machine, but it is advisable to use security bolts to fix the tyre, owing to the smooth rolled finish. Front wheel hubs are a constant source of unreliability on many modern machines, and their adjustments are often most inaccessible. The Timken roller bearing hub as used by the James has much to

eliability, Simplicity, and Accessibility.—

ecommend it, and it would appear that hub built up of Skefko ball bearings ould make a very satisfactory job, as ese bearings are capable of taking uite a heavy side thrust. Detachable id interchangeable wheels are a great nvenience; they will probably become andard on all passenger machines. A ell-designed hub with a knock-out indle is a first-class addition even to ght machines.

Spring Forks.

The chief points requiring attention n spring forks are the protection of nackle joints and springs. Everybody



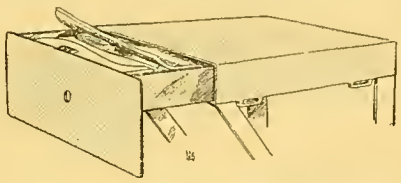
Rudge type of enclosed spring fork. The greasers are important.

nows how even the best spring forks evelop a certain amount of side play fter a long season under hard conditions, but everybody does not know that this side play is responsible for much skidding, tyre wear, and frame strain. Coil springs should always be enclosed, as in Rudge and Matchless forks, and the employment of an air (or even oil) dashpot would save much of the shock due to sudden reaction.

Fittings.

The subject of detail fittings, such as lamp and horn brackets, has already been touched upon, but the larger items also need attention. Without doubt, the wide domed mudguard with plenty of wheel clearance and a very narrow valance is the most satisfactory all-round device, both from the point of view of cleanliness and accessibility, and it is probably only due to the somewhat clumsy appearance of a light machine when so fitted that this type of guard is not more popular.

Toolbags form another important item, and the writer would suggest a somewhat unusual method of carrying the kit. The carrier might reasonably be made of sheet metal stamped in the form of a shallow box and having lugs for the permanent attachment of straps. The rear of this box would be open, and into it would slide a tray just deep enough to accommodate the deepest tool. The tray would be filled with paraffin wax (which sets quite hard), and the tools warmed and dropped into position so that they melt out the wax and form a close fitting bed. Wooden tool handles would, of course, need to have the bed carved out, and the tools most frequently used would lie in front of the drawer. A thick felt flap would complete the job, and the number plate would form a convenient end to the drawer. This method would be simple and accessible, would prevent rattle, and at the same time a missing tool would at once be obvious. There would be no room for spares in such a contrivance, and these should be carried in a case on the top tube as near the centre of the wheelbase as possible, as in that position they will be least subject to road shocks. While on the subject of tools, how is it that so many spanners are needed on the average motor cycle? With a little careful designing

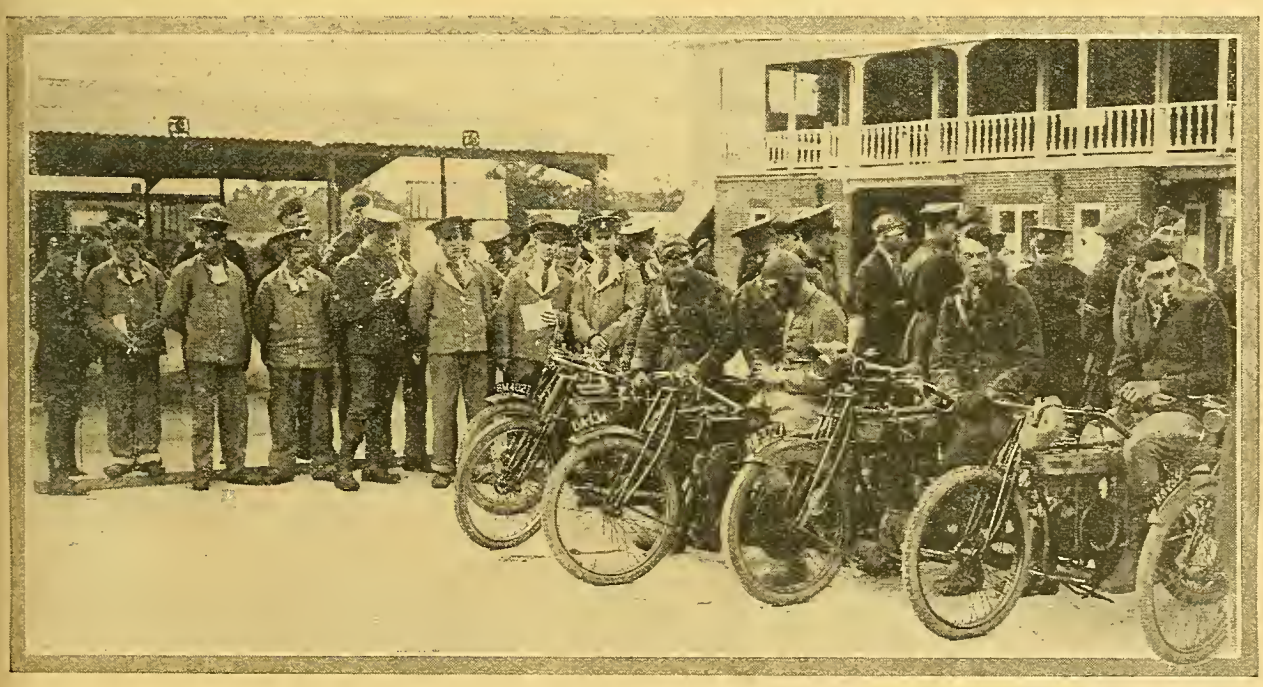


Suggested form of sheet metal tool-carrier. The drawer is filled with melted paraffin wax, into which the tools are dropped in such a manner as to form their own bed.

two sizes of nut only are needed on the engine (with the exception of the valve cap spanner, which can be combined with the steering head nut spanner) and two sizes of nut on the frame. It might even be possible to arrange that the sizes of frame and engine nuts were equal, in which case the tool kit would be greatly simplified.

Practical readers will think of many other details which would simplify the motor cycle or render it more accessible, but these remarks may possibly give a start to a subject which badly needs ventilation. The writer will look forward to seeing correspondence on the subject in the columns of *The Motor Cycle*.

UBIQUE



THE "ALL-KHAKI" MOTOR CYCLE RACE MEETING AT BROOKLANDS.

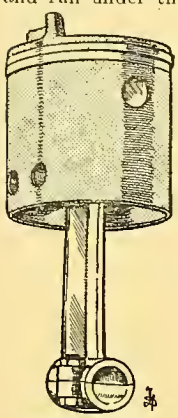
Competitors lined up for the start of the serpentine race. It was won by Second-Lieut. G. Barnard, R.E. (3½ h.p. Sunbeam), who won *The Motor Cycle* Cup for the best aggregate performance of the day. Note wounded soldiers, who were greatly interested in the racing. A fully illustrated report of this successful meeting appeared on pages 159-163 of our last issue.

A 21

A ROTARY TWO-STROKE ENGINE.

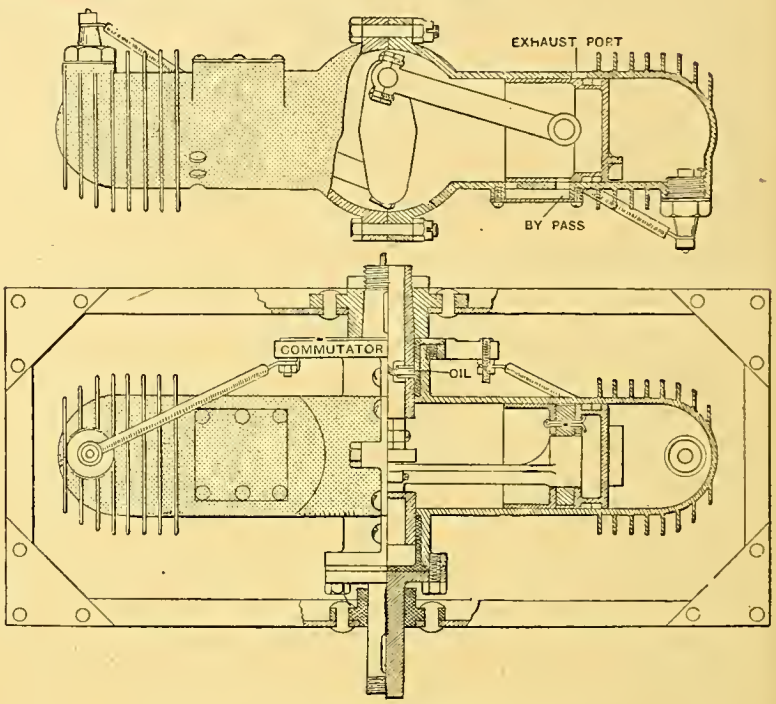
A Type which Combines Power with Light Weight.

IN these days of comparative standardisation it is a pleasure to come across an engine which embodies really unusual features, especially when they are of a practical nature. Such an engine is now undergoing tests at the works of Messrs. Wilfred and Co., Ltd., of Mount Street Mills, Nechells, Birmingham, and two experimental models have been built and run under their own power. At the present moment, though still in an experimental stage, these models have shown great promise, and the designers have considerable faith in the ultimate results. The engine which we examined had two horizontally opposed cylinders of 50×50 mm. bore and stroke, each cylinder being cast with one-half of the crank case, so that it is only necessary to bolt the two castings together, the split being on a vertical line passing through the centre of the crankshaft.



Piston and webbed connecting rod of Wilfred rotary two-stroke engine.

The connecting rods are formed of phosphor bronze castings, split and bolted together at the big end. Each piston carries two rings mounted in a single groove, and the gudgeon pin is placed rather high up. The piston head is flat and has a curved vertical baffle plate across the transfer ports. The crankshaft, which is rigidly fixed to the main frame, has opposed cranks, and serves as the inlet pipe, a light snifting valve being fitted to the carburetter to prevent blow back. The transfer passages are covered by detachable plates, and, as the cylinder castings are identical, a good balance is obtained. In the experimental model all ports are formed by drilling suitable holes through the cylinder and piston walls, and the port setting is somewhat unusual. As the whole engine, with the exception of the crankshaft, rotates, no flywheel is needed, and the little power plant weighs only 12½ lb. and measures 13in. in overall length.



A novel rotary two-stroke engine, described on this page.

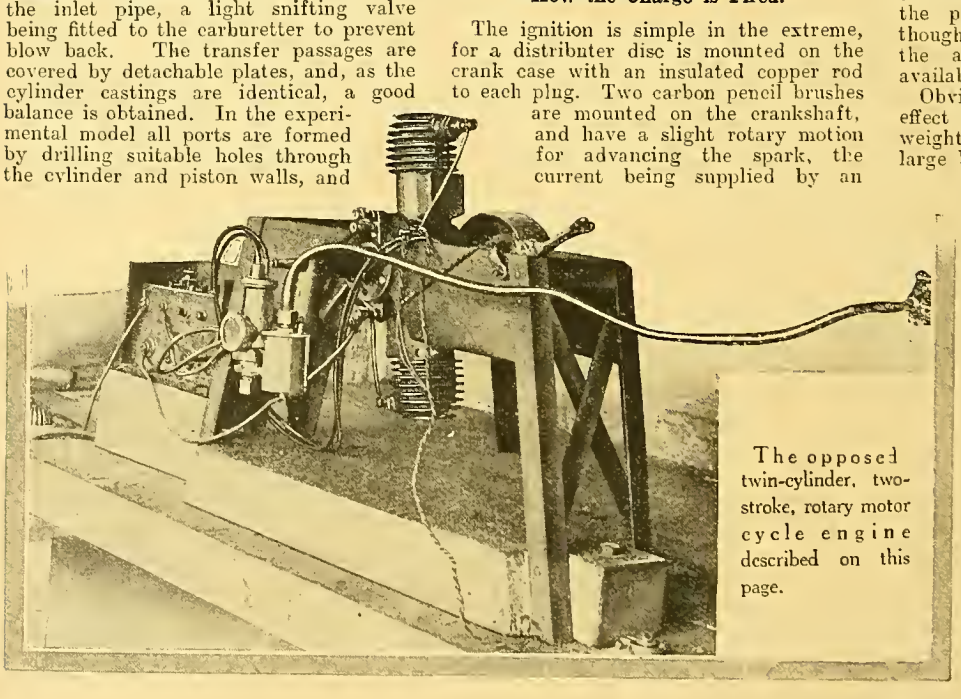
How the Charge is Fired.

The ignition is simple in the extreme, for a distributer disc is mounted on the crank case with an insulated copper rod to each plug. Two carbon pencil brushes are mounted on the crankshaft, and have a slight rotary motion for advancing the spark, the current being supplied by an accumulator through a coil. Lubrication is carried out on the petroil system, though arrangements have been made for a drip feed if it is found to be necessary.

It will be realised that both cylinders fire simultaneously, but that the double explosion occurs once in every revolution, so that very fair torque is obtained, and the power is by no means negligible, though at the present moment details of the actual brake-horse-power are not available.

Obviously, an engine of this type would effect a considerable reduction in the weight of a motor cycle, and may have a large bearing on the future of the lightweight movement.

The patentee of this engine is Mr. William E. Jennings, of Walsall. In the patent specification it is stated that the object of the invention is to produce a simplified construction of rotary engine, to avoid the use of valves and timing cams, and to enhance the efficiency.



The opposed twin-cylinder, two-stroke, rotary motor cycle engine described on this page.

The other day we were chatting with Second Lieut. S. Theo Newsome, of the 2nd Battalion Royal Warwicks, who was formerly with the Daimler Co., and a well-known motor cyclist. He told us that he has frequently received letters from people who have confused his name with that of Second Lieut. C. T. Newsome, the Rover rider, particularly while they were both away at the Front.

When it's a question of tyres

there's only one for your serious consideration, and that is the BATES-BUILT; mile for mile, and sovereign for sovereign, there is no other tyre that represents so much actual £ s. d. value.

The BATES possesses a thick, dome-shaped tread, durable and dependable, that whilst offering the sternest resistance to punctures is withal remarkably resilient and luxurious to ride upon.

You cannot obtain a safer tyre for use on greasy tramlines and slippery cambered roads. The BATES is designed scientifically to prevent skidding. A ridge on each side of the tread engages the road surface directly the machine heels over, arresting the slightest tendency to skid.

Safe Rules in Cornering.

How to Ride round Dangerous Corners Quickly and Safely.

IN learning the art of cornering, the feelings of the beginner are something akin to those of the peaceful old milch cow, who discovered that she had given birth to a steam-driven butter churn instead of a nice straddle-legged, goggle-eyed calf. At first he is filled with vague uncertainties and a sense that things are not as they should be, secondly he makes up his mind that something is quite wrong, and finally he proceeds to get used to it.

There is nothing that stamps the novice with such certainty as the manner in which he takes a difficult corner, while amateurs of long experience often mishandle their machines when negotiating sharp bends in a manner which leaves much to chance and the fortunate likelihood that there is no fast-moving vehicle approaching in the opposite direction. A little thought with regard to the way in which a corner should be taken reveals the fact that it is far easier to do the thing safely than by taking risks.

It is, of course, unfair to other road users to negotiate blind bends at speed, but accident is much less likely to occur when taking a corner, say, at twenty miles an hour, in the right way than when taking it dead slowly in the wrong way; in other words, the expert rider can maintain an average on a tortuous road without taking risks that the novice would be hard put to maintain, even though he risked his life at every bend.

General Rules.

It is, of course, impossible to lay down hard and fast rules with regard to cornering, but there are certain conditions which apply in every case, and which are obvious to anyone giving the matter a moment's thought.

The accompanying plans show an extremely dangerous village corner which the writer has had under observation for some time, and which may serve as a typical illustration. It will be observed that, owing to the buildings set at the roadside, it is impossible to obtain a view of the roadway ahead till one has actually reached the turning point. The dotted lines in fig. 1 may be taken as representing the wheel tracks of a number of motor cyclists who have passed during the week-end. Though the corner is visible from a considerable distance, the majority of riders are not prepared to take it till they reach the point A, from which the natural impulse is to cut in towards the wrong side of the road so as to avoid too sharp a bend. The result of this manœuvre is that the point B, which is the danger point, finds them on the wrong side of the road, and, not until they have reached this position, are they able to see round the corner.

Any amount of hooting does not excuse taking a corner in this manner. In negotiating a bend of any sort it is a wise plan to aim at obtaining the first possible view round the bend before the danger point is actually reached.

Contemplate the dotted line D E C, which shows how the corner can be taken in safety, and with more consideration for one's tyres and general comfort than in the first case.

By approaching the corner from the extreme left-hand side of the road one is able to obtain a view round the bend much sooner than if one were on the wrong side of the road; the turn, in fact, is not begun till one has reached the point E, from which position a clear view of the roadway ahead is obtained, and having convinced oneself that the way is open, one is still at liberty to make a wide sweep.

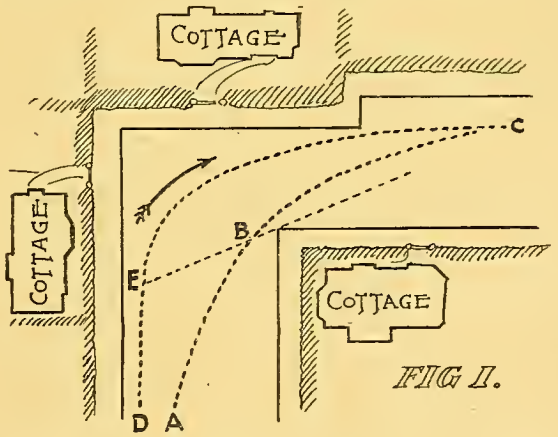

FIG 1.

In taking the corner from the opposite direction, however, that is, in taking a sharp left-hand bend, it is *not* wise to hold one's proper side of the road till the last moment. Again, we must attempt to obtain the first possible view round the corner, and this can only be done by keeping well out towards the centre of the road till almost at the danger point.

The novice, aware that he is approaching a difficult place, conscientiously hugs the left-hand side of the road from the point F till he reaches the danger point G. Nor until he has reached this point is he able to see round the corner, while he himself is hidden from view by the building. The result is that the driver of any vehicle approaching in the opposite direction will have begun to corner before he sees him, by which time they are almost end on. Further, on reaching the point G he is almost compelled to swing out into the centre

Safe Rules in Cornering.—

of the road in order to get round the corner at all, and collision is almost as likely to occur at the point H as at the point G.

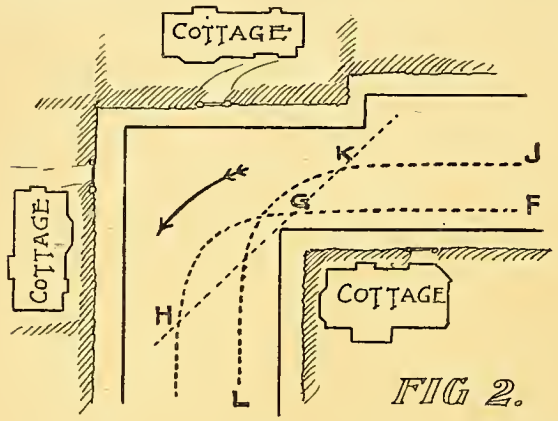

FIG 2.

Now it is obvious that by keeping to the centre of the road, and by following the line J K L, all these dangers are done away with. On reaching the point K a clean view of the roadway ahead is obtained, while any approaching vehicle has the same advantage. And having reached the point K, and made sure that all is well, one is able to open the throttle and dart ahead with much less loss of time than by labouring round the corner by the line F G H.

Practical experience will prove that by observing these commonsense rules one is able to spare one's machine and one's nerves, and to make much better time on the road than by practising the common but extremely unwise method of cutting in at every opportunity. The "cutting" can be done just as effectively, but without taking risks. In the ordinary course of events an experienced rider never attempts to cut a corner till he is convinced that the roadway ahead is clear; not only is it bad riding to do so, but it is not worth while. H. MORTIMER BATTEN.

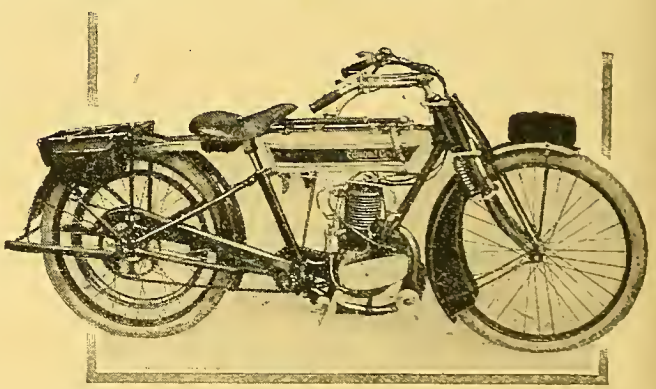
The Edmund Springing System.

Movement of Saddle and Footrests controlled by Long Leaf Springs.

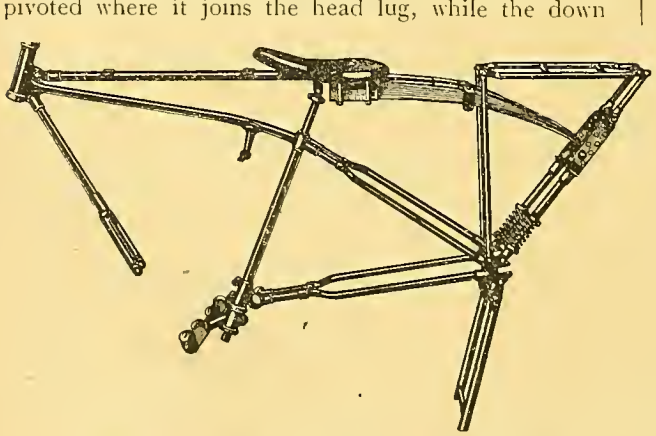
AN interesting type of spring frame which has stood the test of time, and which was not alluded to in the article urging the desirability of rear springing in our issue of July 29th, is the springing system as fitted to the Edmund motor cycle manufactured by Messrs. C. Edmund and Co., Chester. This frame has received the most thorough testing over the roughest road conditions for several years. A machine of this type competed in the Scottish Six Days Trial in 1913, and the frame gave excellent results over the extraordinarily rough road conditions encountered in that trial.

Design of the Frame.

As will be seen in the accompanying illustrations, the chief feature is the inclusion of a double top tube. The lower or main frame top tube is considerably dropped. Within this main frame the engine, gears, and wheels are carried in their normal position, while upon the top tube, which is parallel to the ground, the saddle is carried, and the tank, which is divided to allow for movement of the frame. The top tube is pivoted where it joins the head lug, while the down saddle tube passes right through the main frame down tube in which it is able to slide. To the bottom of this inside down tube are attached the footrests. The springing of these auxiliary top and down tubes is obtained by supporting them on two long leaf springs clamped to a lug beneath the saddle. The rear ends of these springs are fitted to two supports attached to the rear fork ends, and which also form the rear stays of the luggage carrier. At the lower ends of these stays, which are telescopic, are fitted two small spiral springs to take up the recoil in the same manner as shock-absorbers on a car. A good feature of the frame is the absence of whip or side play, owing to the portion carrying the rear wheel having no movable joints. In the near future we hope to record our opinion of the latest frame, the makers having kindly offered to place a machine at our disposal for trial. We have already had a short run on it fitted to a Levis two-stroke machine, and were favourably impressed with the comfort provided; we are therefore looking forward to a further test.



The Edmund lightweight, which is fitted with the Edmund patent system of rear springing. The engine is a Levis.

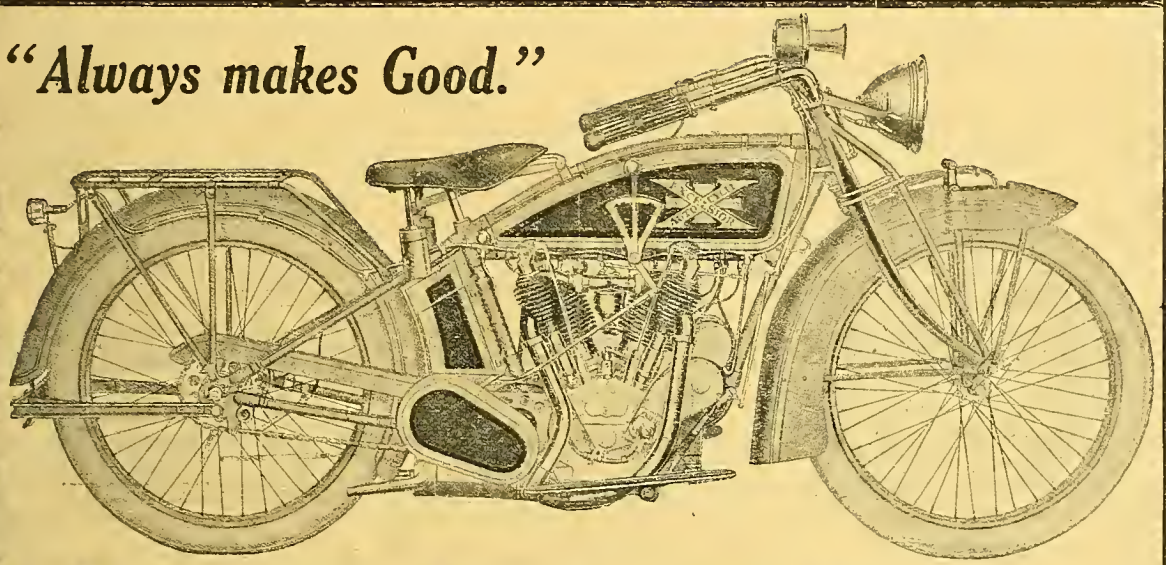


Showing the design of the Edmund springing system

The AMERICAN EXCELSIOR

America's Best Auto-Cycle

"Always makes Good."



You can have one to-day.

America's Greatest Motor Cycle—the American Excelsior—"The Good Old X" is here! You can buy to-day this highly-efficient product of the largest and best equipped motor cycle factory in the world — at an extremely low price. A high-powered machine designed for speed yet bristling with refinements, at a price which might reasonably be charged for a second-rate machine.

7 h.p., 3-speed countershaft gear, multiple disc clutch, chain drive, kick starter, mechanical lubrication,

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

The All-khaki Race Meeting.

Sir,—Will you kindly allow me a small space in your valuable paper to say how I appreciated the All-khaki meeting at Brooklands? It was one of the most enjoyable afternoons I have spent for a considerable time, and I sincerely hope another meeting will be got up on the same lines in the near future. I believe *The Motor Cycle* was mainly responsible for the success of the meeting. Wishing your paper every success,

FRANK COLLARD (Lance-Corporal).

The Sidecarrier for Understaffed Tradesmen.

Sir,—Seeing that you have published illustrations of tradesmen's sidecars, I am sending a photograph of the outfit we are now using. It is a 1914 4¼ h.p. chain-driven B.S.A., and is giving the greatest satisfaction. It can easily draw 2 cwt. The cost of running is much less than the cost of keeping a horse, although it runs many more miles than the latter could do. Its great advantage, however, is its speed, which is greatly appreciated by understaffed tradesmen. The box body, which was made by a local firm of coachbuilders, can quickly be removed, and a passenger sidecar fitted in its place.

B.S.A. sidecarrier employed by a butcher. See accompanying letter from S. J. Hawkins.

Hoping these few lines will be of some slight assistance to you in convincing the public of the utility of the motor cycle.

S. J. HAWKINS.

Oxford Roadways.

Sir,—Mr. Vulliamy speaks of Oxford thoroughfares apparently as a native. Speaking as a stranger, who has sometimes to travel from London to Gloucester by road, I should like to say that the really disgraceful state of the Oxford thoroughfares impresses such an one, if possible, almost more unfavourably. The public are indebted to Mr. Vulliamy for calling attention to this matter. Perhaps to some extent the state of affairs is due to the way the motor 'buses are driven rather than to the motor 'buses themselves. Some of the drivers seem to lack any consideration. I remember I was stopping for petrol somewhere to the west of Carfax when a motor 'bus came by at full tilt, splashing us plentifully with mud and absolutely ruining the white dress of a lady who was crossing the road. I have no sympathy with those who brand as a road hog every motorist that exceeds the speed limit, but this sort of behaviour is real thoroughfare "swinishness." L.M.M.J.

Automatic Carburetters.

Sir,—I read with great interest, in your issue of July 29th, Mr. J. Reed's experience with a Claudel-Hobson carburetter. I should like to know if Messrs. Claudel-Hobson are now supplying carburetters complete, and the price of same; also if Mr. Reed would be kind enough to give a description of the alterations to his engine and help another Triumph enthusiast to increase the m.p.h.

R. S. THOMSON, R.N.R.

Magneto Rear Lights.

Sir,—Seeing "Shazbazzik's" reply to "HE 118" *re* magneto rear lights, I thought I would have a go at making a coil according to instructions given. Having knocked the ends off a Kodak film spool, I bored a ⅜in. hole in each, and, having cut a number of lengths of soft iron wire 2¾in. long, pushed them through the holes, until the last few had to be driven in. The wire core and ends were insulated with tape, and then wound with 24 gauge enamelled wire, four layers ("Shazbazzik" does not say the size of wire, by the way), as directed. This was then connected up with the magneto and the engine started.

Alas! for the poor Osram lamp, which gave one or two brilliant flashes, and then was no more. Another layer of wire was put on, and another trial made with a new lamp, but, as the light given was still very brilliant, a further layer of wire was put on, and this seems sufficient. 3½ volt lamps, as used in the pocket lamps, were used.

I notice "Shazbazzik" says two 4 volt Osram lamps can be used in series. Does he think there is enough current given off to light what is really an 8 volt lamp without taking too much from the magneto and causing the engine to miss? H 1227.

Does an Engine Run Better at Dusk?

Sir,—In reference to the letter in your issue of July 22nd under the above heading from "G.P.G.K.," I have yet to be convinced that an engine does run better at night, but even if this is a fact, it cannot be due to either of the reasons advanced by your correspondent.

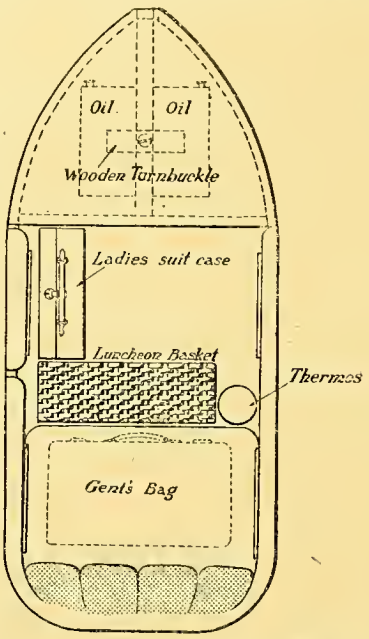
Carbonic acid gas (carbon dioxide) is neither inflammable, nor is it a supporter of combustion. It is one of the products of combustion, and its introduction into the cylinder of a motor cycle engine cannot be advantageous. It is further not a fact that plants, flowers, etc., at night give off a considerable quantity of this carbon dioxide. The green colouring matter of the leaves has the power in sunlight of decomposing this carbon dioxide, the carbon of which it assimilates releasing the oxygen into the atmosphere. If your correspondent is convinced his motor cycle *does* run better at night, he must look for other causes than those he mentions PERCY S. CLEWS.

Disposal of Luggage on a Sidecar.

Sir,—I thought perhaps a description of the way in which luggage for two sufficient for a ten days' tour is packed on my sidecar might be of interest.

The heavy luggage, comprising all things needed at the journey's end, is packed in a collapsible suitcase in a waterproof cover, and strapped firmly to the grid. It sometimes is undisturbed for several days. The things needed for a one night stop are disposed of thus: Gentleman's, in a soft leather bag, which fits in the rather shallow cupboard under the seat; lady's, in a soft canvas suitcase, which fits in edgewise after the passenger has taken her seat.

A sponge bag, with toilet articles and towel, is carried in the side-pocket in the door. Thus a refreshing wash can be indulged in by the side of any spring or stream (after a repair job, for instance) without disturbing the main packages. A canvas bag, with boots, shoes, and bathing suits, is packed in the toe of the sidecar under the mat, and over the locker for spare oil tins. I may say that I oil liberally, and prefer to stick to one well-known brand, not always procurable in remote parts, so I put two quart tins side by side, lying forward, with a partition between them to which a wooden turn buckle is screwed, holding both tins securely in position.



A luncheon basket lies on the mat under the passenger's knees, and a Thermos in a holster alongside completes the outfit.

Cigarettes, matches, etc., occupy the pockets opposite the door. The map pockets on either side the seat hold maps, a copy of the Michelin guide, eau de Cologne, electric flash lamp, newspapers, dusters, and a paint brush for cleaning the engine, etc.

On looking at the sketch one's reflection is bound to be, Where is the passenger going to be stowed away? But I can assure critics that, doubtless owing to the fact that the sidecar is large and the passenger small, there is a place for everything and comfortable room for the lady as well. Anyway 100 miles after lunch on a big twin outfit have no terrors and no after fatigue. When the bags are all out of the sidecar and the contents dispersed around a bedroom one would hardly credit in what a small compass they travel. The first time of packing needs some scheming, but after that it all comes easy enough. Y.T.O.

American Machines in South Africa.

Sir,—I noticed in *The Motor Cycle* of last mail a paragraph showing the falling off of motor imports into this country for 1915 compared with 1914. As you are aware, the European war is responsible for this. New British models are hardly obtainable here, and I know several motorists anxious to buy, but cannot get them even for spot cash. New models arriving are even "drawn for" by depositors who have been waiting months for them.

I have just returned from a holiday in Durban, where the agent of one of the leading English makes informed me that spares on order six months ago have never arrived, and that he could easily dispose of forty new models if he could only get them.

By the enclosed cutting from the leading daily paper here you will see what a big bid the Americans, especially the Indian, are making for this market. Their machines are well displayed in the shop windows with all sorts of spares and accessories, and are well advertised, too. Then again, compare the price of £50 for a 4 h.p. single-cylinder free engine model with that of the English equivalent at £72 10s., plus about 10% war charges.

Of course, we realise how busy the British factories are with war orders, but meanwhile our American competitors are not letting the grass grow under their feet.

Pretoria, S.A. C. H. DEIGHTON.

[The cutting referred to is of an advertisement of the Indian agents in the *Rand Daily Mail*. It states that 120 single-cylinder Indians were due to arrive on August 1st, and that they would be on show at all agents throughout the Transvaal, Orange Free State, Natal, and Bechuanaland simultaneously.—Ed.]

Electric Lighting on Motor Cycles.

Sir,—I have read with interest the article on the simplest form of electric lighting, by "H.W.H." (*The Motor Cycle*, July 22nd), and his kind appreciation of the Volex dry battery. As the producer of this battery, I have always claimed that, for the illumination of motor cycles, it is far preferable, more convenient and economical than accumulators or any other form of dry battery.

I should, however, like you to permit me to correct both Mr. Montgomery's statement and "H.W.H.'s" statement in your last issue with reference to the question of the current consumption increasing by adding the voltage. In the first place, if a bulb taking .3 ampère on two cells were connected to three cells, the current consumption of this bulb would be greater. "Ohm's Law," the basis of the theory of electricity, demonstrated that current equals voltage divided by the resistance, so that a little calculation will prove that the electromotive force increasing, and the resistance of bulb filament remaining the same, must result in an increased current consumption.

However, there is no occasion for controversy on this point, as the bulbs provided for use with a two-cell Volex battery would be 2½ to 3 volts at .25 ampère, and the bulbs provided for the three-cell Volex battery are 3½ to 4 volts at .25 ampère. The life of a two-cell battery and a three-cell battery, each cell of the same dimensions, under these conditions, would be exactly the same, but the light given with the three-cell Volex battery would be 50% greater.

There is one important conclusion in which Mr. Montgomery, "H.W.H.," and the writer are in agreement, and that is, if the right battery be used, this form of lighting compares favourably with other forms.

M. H. GOLDSTONE.

Exmoor Roads.

Sir,—Replying to the enquiry signed "EL 1969" in last week's issue, I have just returned from a tour which included Exmoor and North Devon, and am thus able to be of service to your correspondent.

The road from the main Porlock-to-Lynmouth Road to Oareford and Oare is quite impossible, and it is better to continue along the main road for somewhere about four miles from the top of Porlock Hill and take the direct road down to Oare from near County Gate. This is a steep descent, but the surface is all right.

For the Doone Valley it is much the best to leave the machine at Malmsmead (the "Lorna Doone Farm," there is excellent accommodation) and explore on foot—though there is little to see. Malmsmead is most picturesquely situated on the Bagworthy Water, which divides Somerset and Devon (hence the amusing difficulties of the party attacking the Doones referred to in the famous novel) about a mile from Oare, and midway between there and Brendon. On reaching Oare from Porlock the church should be visited, where Lorna Doone was married (and shot at by Carver Doone), and then a turn to the right down the valley taken to Malmsmead.

All the hills in these parts are fearfully steep, but with a low gear they are climbable. My mount was a Calthorpe-Jap 2½ h.p., gears 5½ to 1 and 10½ to 1. What is worse, the surfaces are often very rough and loose and stony, particularly up the new Porlock Hill near the top, and the main road, and from Malmsmead to Brendon. But the scenery is most gorgeous.

Wishing your correspondent good luck, and earnestly advising him to carry two spare covers,

H. CHALLEN SHARP.

[We have received other letters containing the same information, for which we thank our correspondents.—Ed.]

Motor Cyclist Volunteers.

Sir,—In your issue of July 29th, on page 117, there appears a very sensible and none too strongly worded criticism of the childishly futile Motor Cyclist Volunteer movement. On page 115 of the same issue half a page is devoted to a photograph and letterpress describing an outing by the Midland Branch of this organisation.

I have seen little of this movement myself—I only returned home from duty two weeks ago from the Front, where I have been since last September—but, if the report on page 115 is not written in jest, and may be taken as representative of the doings of this body as a whole, will you allow me to take my stand in your columns beside your correspondent "M.B.," and say to the hale healthy men who are playing at this childish travesty of war, "For God's sake give up this fooling now, and take a hand in the sterner game. If you can't or won't do that, at least give up your fooling just the same, for to those who have seen even a little of the great grim tragedy that is being enacted little over fifty miles from these shores, your doings seem like a child's burlesque of death."

A.G.M. (Captain A.S.C.)

Sir,—We note with surprise and disgust each week in your paper the publicity given to the events and outings of motor cycle volunteer corps, whose chief object is only for a national emergency.

Now the chances of an invasion are considered as comparatively remote, and one is struck when looking at the pictures of manœuvres, etc., with the fact that many of the members are young fellows who are of an eligible age for Active Service. It is a disgrace to the sport of motor cycling that these young fellows should be encouraged to join such organisations when they are so urgently needed at the Front. One can only conclude that, by joining these corps, they are silencing their consciences and ignoring their country's call by persuading themselves they are doing their duty.

If there is no room for them as military motor cyclists (and they have already had many chances of joining various motor sections for Active Service), let them do their duty, as so many other motor cyclists have chosen to do, by joining infantry regiments rather than stay at home waiting for an invasion.

This letter is not an attack on the principles of these motor cycle volunteer corps, but against those members who are eligible and fit for Active Service, and who are sheltering themselves under such organisations. The ranks ought only to be filled by those who are over age or have been rejected as medically unfit.

The writers would like it to be understood that, before leaving England, (1) they tried to enlist as military motor cyclists, but there were no vacancies; (2) ever since arrival here they have tried, unsuccessfully, to secure a transfer to some motor cycle corps for Active Service.

Pte. J. V. PARKER.

British Magnetos.

Sir,—The question of the magneto supply is discussed very seriously by your readers, and as we all have some that are near and dear to us at the Front, we do not intend to buy any more German machines. "Ixion" is voicing the opinion of many readers when he suggests (page 99, issue of July 29th) that all the British magneto makers should combine. The Simms Co. are not novices at magnetos; why are they not more at the front nowadays? I have a Simms magneto, the parts of which are interchangeable with the Bosch machine.

Some few years ago you published figures showing that there were 13,000 magnetos needed for the motor cycle trade every year. I am sure there are more now.

ULSTER.

AT THE "ALL-KHAKI" MOTOR CYCLE RACE MEETING (Another meeting is to be held on Saturday, Sept 4th.)
Private W J. Reid, of the Royal Fusiliers, bringing his 7 h.p. Indian up the test hill in the unlimited hill-climb.

"THE MOTOR CYCLE" RECRUITING SECTION.

Latest recruits in the Motor Machine Gun Service.

UP to the end of last week 3,443 applications from motor cyclist recruits had been dealt with by the Editor.

We still receive a number of applications for transfers from men in the Territorials and new armies, though it has already been stated that transfers are now most difficult, if not impossible, to arrange.

The M.M.G.S. is the only branch of the service requiring motor cyclist recruits immediately.

Two Folkestone motor cyclists rode up to Coventry on their sidecar to attend last week's inspection, and, after being attested, at once proceeded home and reported at the training centre next day.

Among the car drivers attested last week was P. J. Cronie, who for three years had held the position of second chauffeur to H.I.H. the Grand Duke Michael of Russia.

A patriotic Britisher, Mr. A. E. Milson, of Geneva, Switzerland, wrote to us for particulars respecting joining the Army, and on receipt of them paid his own fare to Coventry, and was at once accepted for the Motor Machine Gun Service, having had eight years experience with motor cycles and light cars.

It is a remarkable thing that many youngsters under nineteen years of age are desperately anxious to join the M.M.G.S., and very often falsify their ages so that they may attend the inspection. As several have had to be rejected on account of misrepresentation of age and the fact that their measurements are not up to standard, we think it well to throw out a warning to other youths not to repeat this. The minimum age is 19.

The Excelsior School for training cyclists in the mechanism and handling of a sidecar machine promises to render most useful work. The instructors are Messrs. W. H. Carson and E. Milton, and every day the six recruits with which the scheme has started receive instruction in the works and are then taken on the road. The Editor of *The Motor Cycle* lectured to them last week, with sectional models kindly loaned by the Triumph Cycle Co., Bayliss, Thomas and Co., and C. H. Pugh, Ltd. Expert cyclists of good physique desiring to join the M.M.G.S. *via* the training school should apply at once to Mr. Geoffrey Smith, Inspecting Officer, R.E., 19, Hertford Street, Coventry.

About sixty candidates for the M.M.G.S. had notified their intention of attending the inspection at the Coventry Recruiting Office yesterday (Wednesday). Married men should always attend with their marriage lines and children's birth certificates.

More Motor Cyclists Wanted.

There are still immediate vacancies for experienced motor cyclists in the Motor Machine Gun Service. Pay 1s. 2½d. per day, all found, enlistment for duration of war. Ages 19 to 38. Candidates who fill up the form in our last issue and post it to Mr. Smith will, provided they state that they are ready to enlist at once, receive a free railway warrant to attend an inspection of recruits on Wednesday, the 25th inst., at the Recruiting Office, Masonic Hall, Coventry, 2.30 to 4.30 p.m.

Williams, V. (Llanwrtyd Wells).

Vacancies for Car Drivers and Mechanics.

A limited number of vacancies exists for car drivers of at least three years' experience, and fully qualified mechanics who have held similar positions in motor cycle factories or leading garages. The pay is 6s. per day. Applications in each case should be made to Mr. Geoffrey Smith, Editor of *The Motor Cycle*, enclosing two references from employers.

Despatch Riders, R.E.

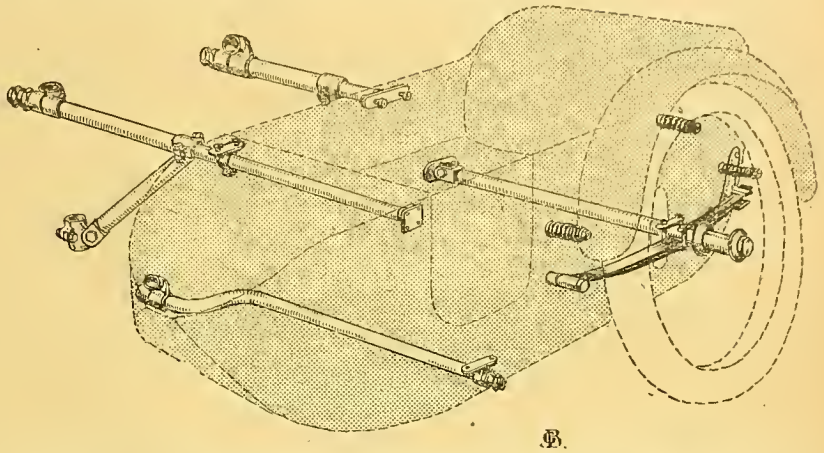
A number of motor cyclists were passed for the waiting list of despatch riders in the Royal Engineers last week. It is, however, impossible to state when the men will be called up, in view of the number of names on the list.

The Latest Bramble Sidecar for Spring Frames.

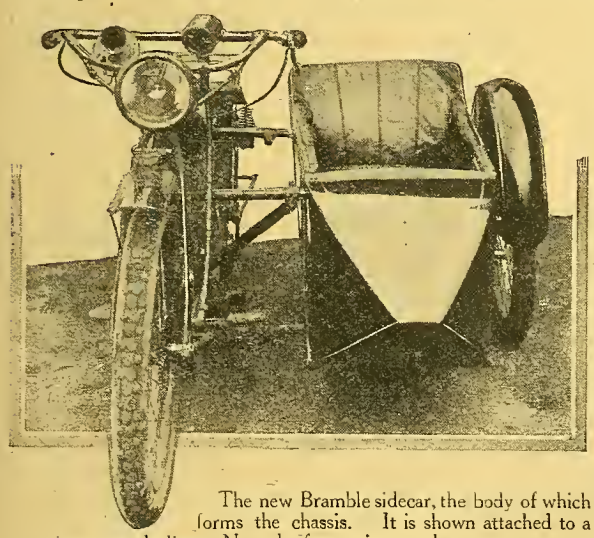
An Ingenious Departure in Sidecar Design.

READERS who own motor cycles fitted with spring frames will no doubt be interested in the latest Bramble sidecar, which is specially designed in order to obtain to the maximum degree the advantages of a spring frame. In general appearance it resembles the ordinary Bramble model with the enclosed chassis, but in this particular model the body actually takes the place of the chassis. This has several advantages, the chief being the gaining of a very low riding position and the saving of a certain amount of weight.

In the sidecars that have been used with spring frames up to the present, although they have allowed for the springing of the bicycle frame, the benefits have been considerably minimised by the fact that the sidecar chassis has been rigid, thus imparting road shocks. In the case of the Bramble the body is attached to the bicycle frame in such a manner that it forms one unit with it. The axle passes through a recess in the body under the seat, and is hinged at the far end where it is attached to the body. The body is supported on the axle by a half elliptic spring. It will be seen that the only unsprung parts of the whole combination are the three wheels and the sidecar axle, which should reduce the strain on the bicycle to a minimum. Further, the least possible amount of unsprung weight is always an advantage.



Skeleton view of new Bramble sidecar specially designed for machines with spring frames. The sketch shows how the connections are attached to the body itself, which is specially strengthened, there being no frame.



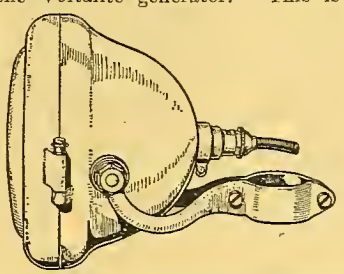
The new Bramble sidecar, the body of which forms the chassis. It is shown attached to a spring-frame Indian. Note the four-point attachment.

The body, of course, is specially strengthened in order to withstand the extra strain thrown upon it. The two main connections pass right through the body, and are attached by means of plates bolted to it, while the fitting attached under the saddle is simply bolted to the strengthened side. The attachment to the bicycle is at four points—two on the down tube, one under the engine cradle, and one under the saddle. The clips are quickly detachable, and it should only be a matter of a few minutes to attach or detach the sidecar.

The whole outfit has a very pleasing appearance. It would seem as though the mudguard problem has been solved in this design, as, instead of being supported on an unsprung chassis at the end of long stays, it is securely bolted to the body, where it is, of course, sprung as in car practice. We have not yet had an opportunity of trying this sidecar, but we are inclined to the opinion that, although the driver's comfort must be greatly increased by the extra springing, the passenger may miss the luxury of the springing afforded by the usual long C springs—of which there is no equal in comfort even in the car world.

ELECTRIC LIGHTING BY MAGNETO GENERATOR.

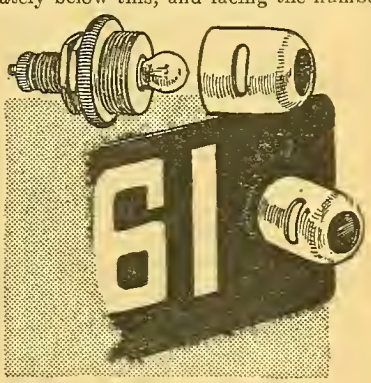
AMONG the many interesting electrical accessories sold by Messrs. Ward and Goldstone, of Springfield Lane, Salford, Manchester, is the Voltalite generator. This is an electric lighting installation which consists of a small magneto generator attached to the forks of the motor cycle. The drive is obtained from the front, or, if preferred, the rear wheels, by means of a small rubber-tyred wheel pressing on the rim. This, combined with the Superba head lamp, should make an ideal lighting set for the man who uses his machine much at night.



The Superba lamp supplied with Voltalite outfit.

THE UNIQUE REAR LAMP.

THE small sketch here reproduced is that of the Unique rear lamp, which is a neat, well-made little device for attaching to the existing number plate. The lamp consists mainly of a cone-shaped cap or cover, at the end of which there is a tiny red glass. Immediately below this, and facing the number, is a narrow slot, allowing the white light from the miniature screw bulb inside to be reflected on to the number plate. To fix it it is only necessary to drill a half-inch round hole in the top right-hand corner of the number-plate, and fix on the lamp with the nuts provided. The retail price is 3s. without the bulb, and it is sold by Brown Bros., of Great Eastern Street, E.C.



The Unique tail lamp.

With Gun and Despatch.

THE military motor cyclist again looms largely in the present issue, the important part he is playing in the great European conflict demanding such attention. The upper illustration shows the latest Motor Machine Gun Battery to leave for the Front—The No. 16, commanded by Major Thackwell, the section commanders being Lieut. Carew, Lieut. Conduit, and Lieut. Joske, who are mounted on 4 h.p. Triumphs. It may be observed that the number of cars in each battery has lately been reduced, the C.O. now having the use of a standard pleasure type sidecar outfit. Inset is a Clyno machine gun outfit traversing a rough track.

The lower picture is an official illustration of the Dardanelles operations, showing despatch riders attached to the Royal Engineers after landing on the sandy shores of the Gallipoli Peninsula. It will be noticed that "shorts" and shirt sleeves are the standard equipment in those sunny parts!

Munitions First.

Practically all the largest motor cycle and car manufactories have already been or will be taken over this week by the Government. The manufacturers do not resent the Government's action, believing in munitions first.

No Shortage of Petrol.

15,438,600 gallons of petrol were imported into this country last month. This is a big increase over the June figures, the amount then being 12,662,635 gallons. It is also more than was imported twelve months ago, the figures for July, 1914, being 14,497,722 gallons.

A Case for Police Action.

A correspondent, Mr. W. H. Stallard, calls our attention to a glaring instance of a road hog whom he encountered to his hurt on the Newport-Wellington (Salop) Road. When travelling in the middle of the road he met three men in a cart coming in the opposite direction. The cart was on the wrong side of the road, but when the motor cyclist was within thirty yards the driver suddenly pulled right across the road, forcing Mr. Stallard into the kerb, so buckling the front wheel and throwing him on to his head. These men, we are told, were seen passing up and down the road several times. In a case of this kind it is advisable to communicate with the police without delay.

Appointment of Leading Competition Rider.

Mr. B. Alan Hill has lately joined the editorial staff of *The Motor Cycle*. It is perhaps due to him and to ourselves to state that in September last Mr. Hill joined the British Red Cross, and was serving in France as driver on the 4th Motor Ambulance Convoy until last February, when he was invalided home, and subsequently received his discharge. It may be remembered that, previous to the war, he was a successful competition rider on Rudge and Indian machines, and competed regularly in the Scottish Six Days Trials, having figured in all but one of those trying events. On each occasion he gained a gold medal, and, as a matter of fact, has been singularly successful in long distance competition work, having won a gold medal in each six days trial in which he has ridden—English or Scottish—eight in all. Alan Hill has also taken part in most of the London-Edinburgh and all the London-Exeter runs, and has on two occasions ridden in the Tourist Trophy Race.

From Gallipoli!

"We are all feeling the monotony here very much, and *The Motor Cycle* is very welcome when it comes along. I hope we go to England when we finish here, as I should like to sample some of your roads."—Extract from letter from Gunner D. Gibb, of the New Zealand field artillery, now serving on the Gallipoli Peninsula.

Latest Road Reports.

KENT. LONDON-BROMLEY-SEVENOAKS-TONBRIDGE. The surface of this road is now very poor, being full of undulations rather than pot-holes. The Tunbridge-Hastings road is a little better. Hawkhurst-Maidstone-Wrotham-Sidcup-Lewisham-London. This road on the whole is in pretty good condition considering the nature of the traffic to which it has been subjected during the last twelve months, and forms a good route to the South Coast (Hastings, etc.).

Practically all roads in Winchester are in a bad state. Winchester to Southampton, bad in parts; Winchester to Basingstoke, fairly good; Winchester to Romsey, bad; Winchester to Alton, fairly good (about to be tarred); Winchester to Andover, fair; Winchester to Newbury, fair; Winchester to Portsmouth, not bad; Winchester to Stockbridge, fair; Winchester to Petersfield, fair.

SPECIAL FEATURES.

CUR OVERSEA TRADE.
MILITARY MOTOR CYCLE MATTERS.
THE SPORTING SIDE OF MOTOR CYCLING.

A Tip for Rigid Footboards.

A correspondent tells us that fou or five pieces of rubber gas tubin bound together and fastened to th footboard form an excellent insulatin cushion, which very considerably lesser the footboard vibration, and increase the comfort of the machine.

The War Funds.

Last Monday's totals of some of th principal war funds read as follow:

The Times Fund for Sick and Wounded	£1,622,19
The Queen's Work for Women Fund	163,71
Indian Soldiers' Fund ...	146,20

Motor Cyclists in the National Register.

No doubt a great many motor cyclist mentioned their favourite hobby whe filling in the National Register las Sunday. Thousands of young men hav acquired practical skill whilst moto cycling which should be of inestimabl service to the State, but the form an instructions were not made clear on thi point. Further, a good deal of waste energy would no doubt have been save had a question such as "Are yo physically sound and fit?" been asked. I will mean many enquiries to ascertai whether men of recruitable age are suffer ing from some disability or bodily defect

The lady's new model 2¾ h.p. Excelsior passenger outfit. Driven by Mrs. W. H. Carson, this machine has already "made good" by making a top gear climb of Stoneleigh Hill with passenger, and also by climbing Saintsbury—a well-known Cotswold gradient, with a grade of about 1 in 6½. The gear ratios are 5¾ and 11½ to 1. There should be a good field for a lady's special sidecar outfit, as the increase in the ranks of lady solo riders is now equally noticeable among those favouring passenger machines.

Midland Motor Cyclists' Volunteers.

The M.M.C.V. Corps held a recruiting parade on Saturday when it was successful in obtaining recruits for both the Regulars and itself. On Sunday members of the Corps spent the day field-sketching at Rowington.

Natives of Uganda like Motor Cycles.

Motor cycles are popular with the chiefs of Uganda, and at Kampala there are about twenty natives who ride them. The majority of the machines are Triumphs, both four and two-stroke models being in evidence.

United Services Brooklands Race Meeting.

As was expected from the great success attending the "all khaki" meeting at Brooklands on August 7th, the venture is to be repeated, and the second meeting will be held on Saturday, September 4th. A list of events and other details will be found elsewhere in this issue.

Average Prices.

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*. We quote those models of which at least five weekly averages have appeared during the past two months. Where it is possible to obtain a sufficient number of each model, we also give the average for the past week.

"The Weekly Blue Bit of Light"

Is the title given to *The Motor Cycle* by one of our Dutch readers. He refers to its lighting effect among the dull collection of daily war literature.

Clamouring for British Motor Cycles.

A Pretorian reader tells us that British-made motor cycles are practically unobtainable in South Africa at the moment, and he knows several motor cyclists in his district anxious to buy, but cannot get them even for spot cash. The new models on arrival are drawn for by depositors who have been waiting months for them. A Durban dealer told our informant that he could easily dispose of forty new models if he could only get hold of them.

The Motor Cycle Trade.

The July Board of Trade returns show a big drop in the imports of motor cycles over the previous month's figures, but this drop is balanced by the big increase in the June figures over those for May, which we called attention to in our issue of July 15th. The exports have dropped back again after the partial recovery recorded in the previous returns. Following are the actual figures:

IMPORTS.

July, 1915.—495 motor cycles, value £24,442 (including parts and tyres not imported with complete machines, £37,827).

June, 1915.—822 motor cycles, value £34,990 (including parts and tyres not imported with complete machines, £65,671).

July, 1914.—172 motor cycles.

EXPORTS.

July, 1915.—881 motor cycles, value £39,924 (including parts and tyres not exported with complete machines, £64,601).

June, 1915.—1,020 motor cycles, value £45,128 (including parts and tyres not exported with complete machines, £68,162).

July, 1914.—2,089 motor cycles.

The Accident to the Irish Mail.

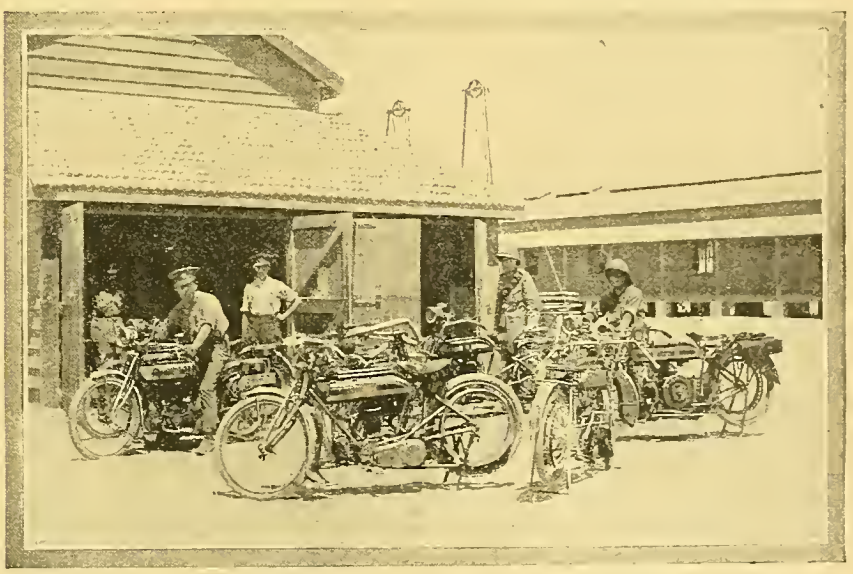
Hundreds of motor cyclists and motorists at the week-end visited the scene of Saturday's accident to the Irish mail train on the L. and N.W. line near Weedon. The overturned carriages could plainly be seen from the old Roman road known as Watling Street from the hill a mile on the London side of Weedon, a village between Daventry and Towcester. The last carriage was hauled on the line on Sunday afternoon, about 4.30, and a severe thunderstorm shortly afterwards burst over the scene.

New Lighting Regulations.

New regulations were issued last week to the effect that in the London area lamps on all vehicles are in future to be lighted half an hour after sunset (instead of an hour as hitherto), and to remain lighted until half an hour before sunrise (instead of an hour as hitherto). It is presumed that these regulations are the results of the dimmed lights, but at any time it is a good idea, and we hope to see it permanently adopted throughout the country. There is no doubt that the most dangerous time on the road is the hour after sunset, due to the fact that so many road users leave the lighting of lamps until the very last moment.

Presentations to a Well-known Irish Rider.

Mr. J. F. A. Day, who has for some time past acted as assistant hon. secretary of the Dublin and District Motor Cycle Club, is shortly about to leave Ireland to take up his residence in California, and the members of the club took advantage of the occasion to express their appreciation of his services to the club by entertaining him to dinner and making him a presentation of a gold watch. A presentation was also made to Mr. Day on behalf of the Sun Cycle and Fittings Co., whose machine he has ridden with considerable success in the competitions of the club. The hill-climbing competition that was to have been held at Ballinaslaughter Hill did not take place.



Some despatch riders' machines with the Mediterranean Expeditionary Force. Douglases, Triumphs, and B.S.A.'s will be recognised; the machine on the right is a Swiss Moser.

ANOTHER UNITED SERVICES RACE MEETING.

At Brooklands on Saturday, September 4th. List of Events.

THE "United Services" is the more comprehensive title adopted for the next Brooklands race meeting, which is open to any member of the British Army, Navy, or Allied Forces (in uniform). A good programme has been outlined, and the meeting generally will be conducted on the lines which ensured such a success for the "All-khaki" gathering on August 7th. The sprint races will on September 4th be held on the finishing straight, which is now being put into thorough order.

List of Events.

No. 1.—TWO-STROKE HALF-MILE SPRINT, for motor cycles fitted with two-stroke engines of a capacity not exceeding 270 c.c.

No. 2.—LIGHTWEIGHT HALF-MILE SPRINT, engine limit 350 c.c.

No. 3.—MEDIUM-WEIGHT HALF-MILE SPRINT, touring machines, engine limit 550 c.c.

No. 4.—MEDIUM-WEIGHT HALF-MILE SPRINT, racing machines, engine limit 550 c.c.

No. 5.—QUICK-CHANGE PLUG RACE.

No 6.—UNLIMITED HALF-MILE SPRINT, engine limit 1,000 c.c.

No. 7.—SIDECAR HALF-MILE SPRINT, engine limit 1,000 c.c.

No. 8.—LIGHT CAR HALF-MILE SPRINT, for cycle cars and light cars not exceeding 1,100 c.c.

No. 9.—SERPENTINE FAST RACE, for solo machines of any type

No. 10.—JUNIOR HILL-CLIMB, engine limit 350 c.c.

No. 11.—MEDIUM-WEIGHT HILL-CLIMB, engine limit 550 c.c.

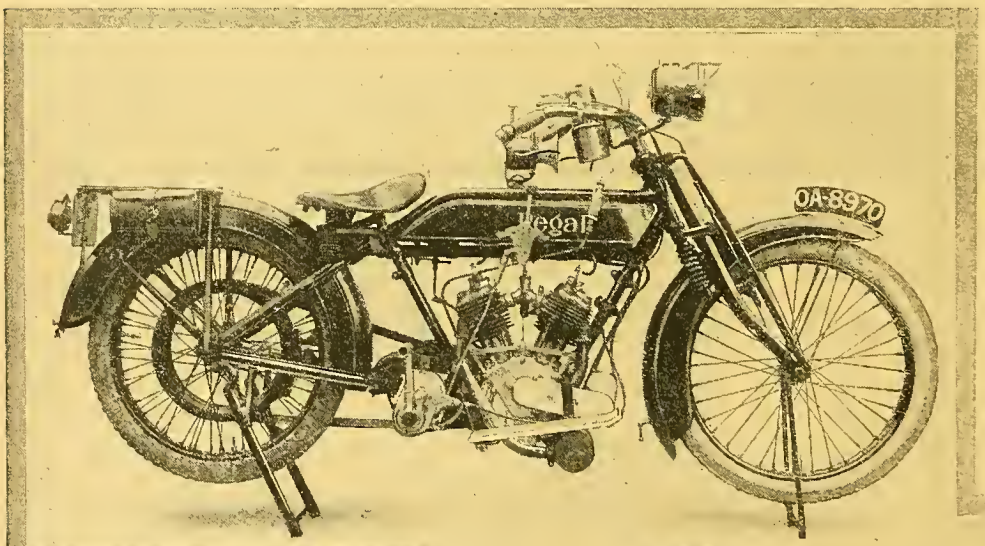
No. 12.—UNLIMITED HILL-CLIMB, engine limit 1,000 c.c.

The sprint races will be held on the "finishing straight" with standing starts.

As in the case of the first meeting, *The Motor Cycle* will present a silver cup for the best aggregate performance of a competitor on any one machine. First and second prizes will also be awarded according to the number of entries received.

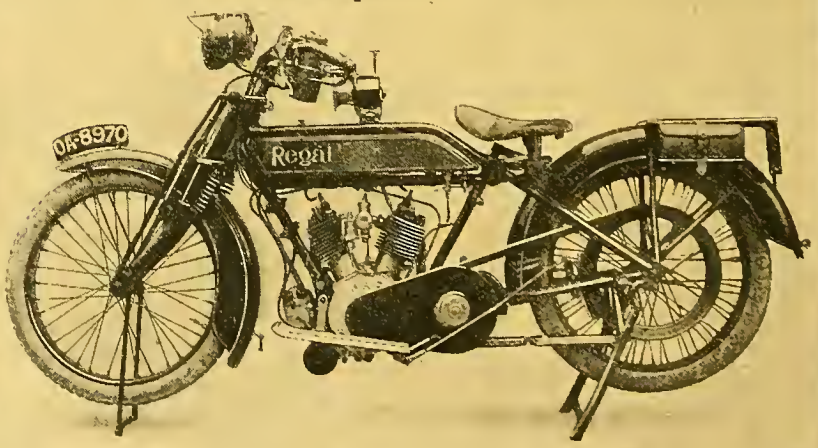
Entries close on Saturday, August 28th. They should be addressed to Mr. T. W. Loughborough, of the Auto Cycle Union, Pall Mall, S.W. Mr. Loughborough and Lieut. F. M. C. Houghton (whose letter in *The Motor Cycle* originated the All-khaki meeting) are the joint hon. secretaries. The entry fee for each event is 2s. 6d. Admission to the track is 1s., but members of the home clubs and competitors will be admitted free of charge.

Motorists from Derby to Leek, on the Ashbourne Road, should be careful not to leave their vehicles unattended whilst calling at restaurants or hotels. For a breach of the regulations a correspondent was recently fined 10s., or seven days' imprisonment, and was ordered to pay a witness's expenses.



A FOUR-SPEED TWIN-CYLINDER MOUNT.

A striking Regal which is fitted with a twin-cylinder J.A.P. engine and a four-speed Jardine gear. Drive is by chain to the countershaft gear box and thence by belt. It is a neat looking machine and well adapted for solo or sidecar work. The belt pulleys of this new model, it will be noticed, are of almost equal size.



Mr. LIONEL S. W. ROOK, of Erdington, writes:—

"Now a word about the gear. I am more than satisfied with it. Last week I and a passenger (about 20 stone in all) made a non-stop run from here to Ledbury, which means, as you know, some stiff pulling over the Malverns. Twice going up the Wyche I was baulked and nearly stopped, but the pulley answered perfectly, and you can guess how very pleased I was. In fact, to sum up, I have tested it in every conceivable way, and it has always acquitted itself wonderfully, and I must congratulate you on your ingenuity in producing such a novel gear. Rest assured I shall recommend it wherever possible."

Read what "The Motor Cycle" says:—

"We were afforded an excellent demonstration of the action of the gear on a 3½ h.p. Triumph. Not only was free engine obtainable, but on the very lowest gear, when the belt was quite slack, there was no sign of slip, and in this position it was impossible to prevent the motor cycle from moving off easily by any attempt to hold it back."

Mr. H. W. PHILLIPS, of Blackheath, London, writes:—

"I am pleased to inform you this is a very satisfactory gear and works splendidly."

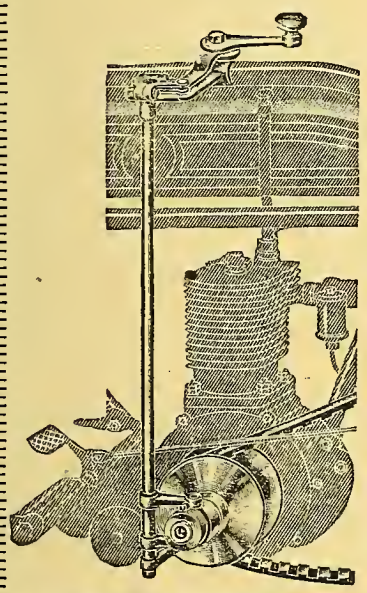
Mr. H. THOMPSON, of Hurley, Atherstone, writes:—

"The Grado Multi-Pulley that was fitted to my bike a little while ago is very good, and I am satisfied with it. It certainly does all that one requires. I am 15 stone, and I often take a 10-stone passenger, and can get up all hills although my machine is only a 3½ Blumfield. In traffic one can travel as slow as desired. For starting it is quite all right, and one can guess I feel the benefit, being a heavy man. The old method of pushing was hard work. I shall have pleasure in recommending your pulley at any time."

Read these letters from riders who have proved the value of

The GRADO Multi-Gear.

The Simple Variable Pulley arrangement for Belt-driven Machines.



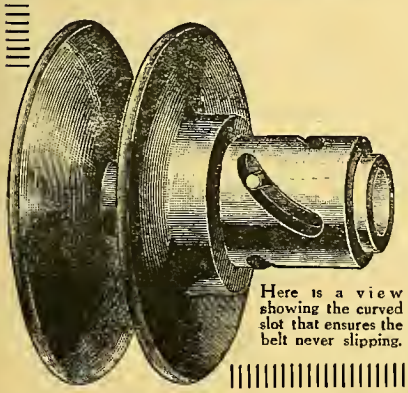
The GRADO GEAR as fitted to machine.

The Grado Gear is most simple in construction—there is nothing to get out of order, and it can be fitted to a standard belt-driven machine in 2 to 3 hours. Why not write for our Catalogue TO-DAY?

PRICES.

Pulley complete (as illustrated), bored to suit engine shaft up to 4½ h.p.	**£3 3 0**
Up to 6 h.p.	**£3 10 0**
Lightweights	**£2 10 0**

We can supply a Special Pulley for engine with Extending Crank Bosses, like the J.A.P., Old Rex, Minerva, etc., for 10/- extra. Recess up to 1¾in. diameter; up to 2¼in. diameter, if necessary, 12/- extra.



Here is a view showing the curved slot that ensures the belt never slipping.

An Outstanding Victory.

WINNING the Irish End to End Trial in the face of the keenest competition from big twin machines of double its h.p. is the latest achievement of the 4¼ h.p. B.S.A. Motor Bicycle. The first place in the flexibility test (solo) also fell to the B.S.A. while the B.S.A. with Sidecar was the only combination of so small h.p. to complete the course. It is interesting to note that five B.S.A's started and all five machines finished. The awards given below are further convincing evidence that it is quite unnecessary to employ an expensive, heavy high-powered machine for solo or sidecar work.

PALMER TROPHY	Won by Mr. R. Jones.
GOLD MEDAL	Won by Mr. R. Jones.
GOLD MEDAL	Won by Mr. T. Toole.
GOLD MEDAL	Won by Mr. F. L. Dooley.
SILVER MEDAL	Won by Mr. W. J. Chambers.
SILVER MEDAL	Won by Mr. T. J. Woods.

Another B.S.A. Success.

CORK and District M.C.C. ONE DAY TRIAL.

GOLD MEDAL	Won by Mr. F. L. Dooley.
GOLD MEDAL	Won by Mr. E. W. Whitaker.
BRONZE MEDAL	Won by Lance-Corpl. Thompson.

TWO of the three machines WINNING THE TEAM PRIZE WERE B.S.A's.

Hill-climbing and Racing in South Africa.

MOTOR cyclists in South Africa, or, to be more correct, those S.A. motor cyclists not fighting in the great war, continue to hold occasional trials which, although naturally not so well supported as in the pre-war days, help to keep those who remain at home enthusiastic, and so prevent club affairs from becoming moribund. These remarks apply also to motor cycling in New Zealand and Australia, and, with home competitions practically suspended, the doings of our Colonial friends are of more than usual interest.

The Cape Province, S.A., in particular, appears to contain many very keen riders, and this week we are enabled to publish details of three trials held by clubs in that State. On July 11th, the Eastern Province M.C.C. whose headquarters are at Port Elizabeth, held a twenty miles road race which resulted in some good sport.

As a result of recent heavy rain, the road (from Uitenhage to Green Bushes *via* Fitch's) was in a shocking state, and there were one or two falls. Some of the competitors were in a state of exhaustion at the end of the twenty miles over such bad roads. Results:

SCENES IN THE EASTERN PROVINCE (S.A.) M.C.C. ROAD RACE.

(Top) 3½ h.p. Alldays and sidecar, driven by H. Braybrooke, at speed.

(Middle) Some of the competitors at the starting point.

(Bottom) Dennis (2¾ h.p Douglas), winner of the solo class.

SOLO CLASS.

1, Dennis (2¾ h.p. Douglas), actual time 33m.; handicap, 8m.

2, Paton (3½ h.p. Rudge), actual time 36m.; handicap, 4m.

3, Scrimgeour (5 h.p. Indian), actual time 38m.; handicap, 6m.

SIDECAR CLASS.

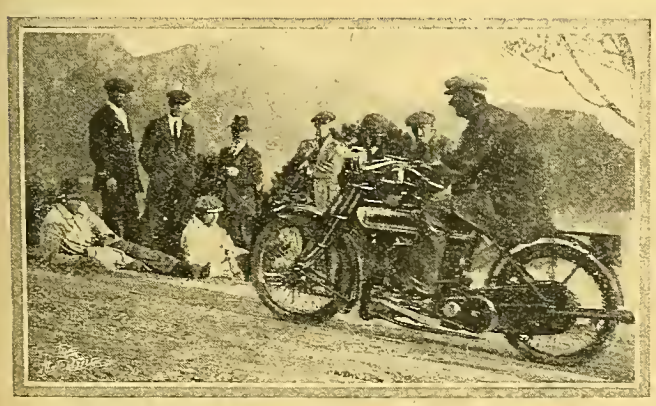
1, S. Nevay (5 h.p. New Hudson), actual time 41m.; scratch.

2, H. Braybrooke (3½ h.p. Alldays), actual time 44.; handicap, 2m.

3, A. Burton (4 h.p. Triumph), actual time 53m.; handicap, 8m.

Further down the coast the East London M.C.C., continuing its activities, held a hill-climb last month at Kwelegha. There were sixteen competitors, and the hill contained three cross gulleys, which do not altogether assist one in making good time. Results:

1, F. Kurts (3½ h.p. Rover).
2, G. Cock (3½ h.p. Rover).
3, H. Feller (3½ h.p. Rover).
4, F. Miles (3½ h.p. Triumph).



J Wyllie (A.J.S.), winner of the Cape Peninsula M.C.C. flexibility test.

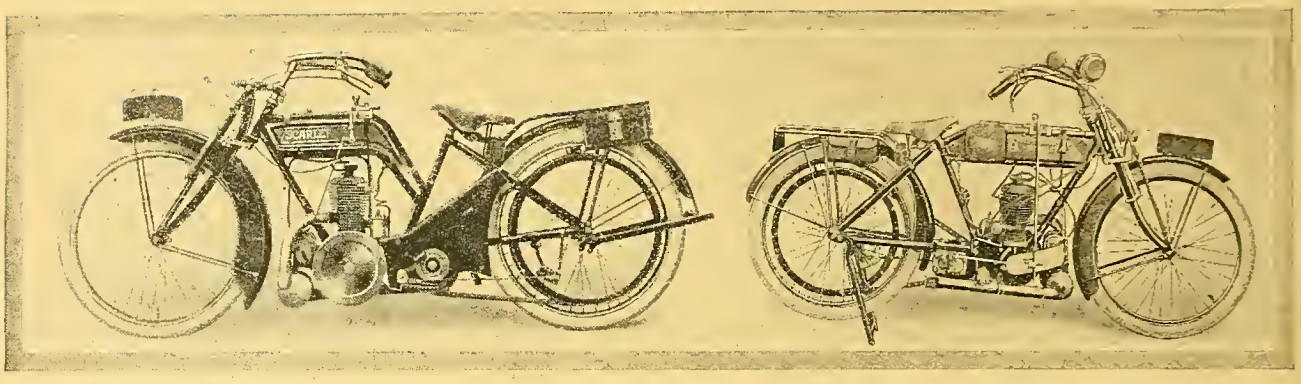
A Flexibility Hill-climb.

The Cape Club recently held a flexibility hill-climb for novices. A slow and fast climb, each about half a mile in length, was the order of the day, with one class for solo riders and one for sidecarists. The same gear was to be used in both attempts, while braking or clutch slipping or touching the ground entailed disqualifications.

The course was badly cut up—S.A. is in the very heart of winter now—but this did not prevent over a dozen riders turning up. Results:

SOLO CLASS.—Winner: J. Wyllie (A.J.S.), variation in time 1m. 59⅗s.

SIDECAR CLASS.—Winner: E. Binns (Premier), variation 1m. 51⅗s.



The 2½ h.p. two-stroke Scarlet—the lady's model on the left. The engine is a 269 c.c. Metro, and both models can be supplied with or without a two-speed countershaft gear. The illustrations are of the two-speed models.

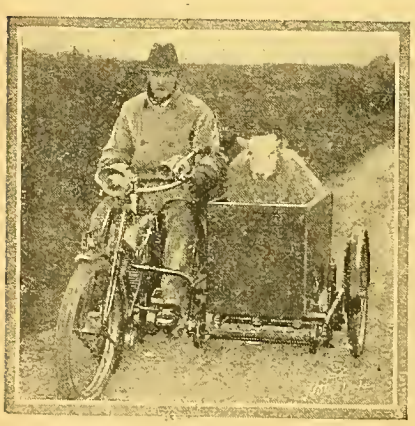
THE SCARLET TWO-STROKE

A NEAT newcomer to the ranks of lightweights is the Scarlet, manufactured by Messrs. Scarlett and Hodkin, of Plymouth Grove West, Manchester. The Scarlet is made in three models—single-speed, two-speed, and ladies' model. The engine is the same in all three, viz., a two-stroke Metro, 70×70 mm., giving a cubic capacity of 269 c.c. It is fitted with an outside flywheel, E.I.C. waterproof magneto, and a Senspray carburetter.

In the case of the two-speed model a countershaft gear box is fitted, with combined chain and belt drive. The lady's model is identical with the ordinary model, only with the exception of the top tube, which in the former case is dropped sufficiently to give freedom for the rider's skirt. The machines are enamelled in scarlet, while the tank is of a rather darker shade of red with black lining.

A DETACHABLE SIDE-CARRIER.

THE accompanying illustration shows a rider on his 3½ h.p. two-speed motor cycle and sidecarrier, in which he took a sheep fifteen miles to a patriotic sale. How the woolly passenger enjoyed the drive is not recorded, but he has successfully put on the motorist's straight-ahead stare, and appears to be looking forward to the journey. The sidecarrier, which is built of three-ply wood and one-inch flooring, is provided with a lid, which is not shown in the illustration. It only cost £1, and fits with thumb-screws to the same chassis as the owner's sidecar body. The passenger body can be removed and the sidecarrier put on in about two minutes. The owner says he has taken sheep, calves, hens, paling posts, a push bicycle, furniture, and even a cooking range in the sidecarrier.

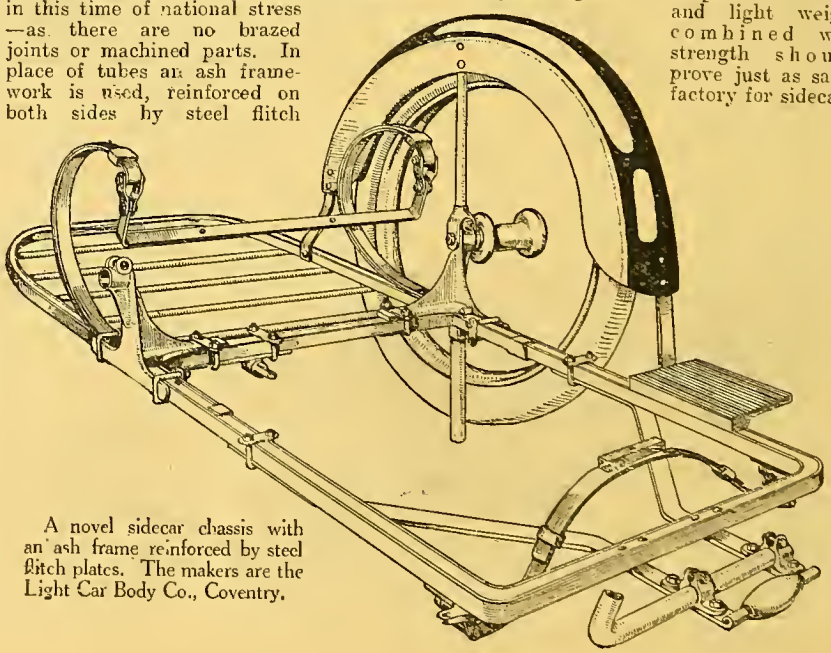


An unusual sidecar passenger.

A NOVEL SIDECAR CHASSIS.

A NEW type of sidecar chassis has been manufactured by Messrs. the Light Car Body Co., of Coventry, the feature of which is the ash frame. One of the points where this chassis scores over the orthodox type is that it can be successfully manufactured without highly skilled labour—an important point in this time of national stress—as there are no brazed joints or machined parts. In place of tubes an ash framework is used, reinforced on both sides by steel flitch plates, which are riveted together. The frame consists of an oval main member that carries the wheel axle and the diagonal saddle support. The spindle and the rear chain stay lug are held by two substantial forgings attached to the chassis by means of bolts and also by clips. These at the same time secure the C springs. The body is supported at the front on a transverse spring. The main front connection is attached to the chassis at four points, thus ensuring rigidity, while the support is taken from the centre. In order to give a finished appearance, a small roller is fitted, which also, in the unlikely event of a connection breaking, would prevent the front of the chassis from digging into the ground and stopping the machine suddenly.

We are informed that the weight is about the same, or, if anything, less than that of the tubular type, strength for strength. We understand it has been thoroughly tested, and has proved most satisfactory, there being no whip. It will be remembered that this type of chassis was used with success on cars a few years ago. Its simple construction and light weight combined with strength should prove just as satisfactory for sidecars.



A novel sidecar chassis with an ash frame reinforced by steel flitch plates. The makers are the Light Car Body Co., Coventry.

if you want reliable information and advice on motor cycle management.

¶ "MOTOR CYCLES AND HOW TO MANAGE THEM" is unquestionably the best and most complete handbook on motor cycles, their care and management.

¶ It will be found invaluable to beginners, and both useful and instructive to more experienced riders. It deals with a multitude of subjects relating to all types of motor cycles.

¶ The buyer of a second-hand machine will find the book equally useful, as it describes old type carburetters, ignition systems, etc., in a special chapter on second-hand motor cycles.

No More Tyre Troubles.

There will be no time lost on the road through bursts or punctures — no wearisome delays — if you fill your tyres with

Essenkay
"ENDS TYRE TROUBLES"

The Most Perfect Substitute for Air yet discovered.

WITH ESSENKAY in the covers instead of air tubes you have all the advantages — Buoyancy, Resiliency, and Life — of the pneumatic tyre. Yet you avoid bursts and punctures, and appreciably increase the mileage of the covers.

Essenkay is a Revelation.

ESSENKAY is better by far than the pneumatic tyre, and there is not a particle of rubber in it. It won't rot or perish. It won't harden. It is impervious to heat, cold and climate. Proof against acids, chemicals, petrol, and oil.

Agents Wanted. — We are open to appoint live Agents in many districts.

Not affected by continuous use.

ESSENKAY is not affected by continuous running — when the covers have been worn through the ESSENKAY filling can be transferred to new ones.

Test It Free.

Get ESSENKAY into your tyres without delay. We offer you an opportunity of testing it Free and at our expense. So do not hesitate. Write to us to-day.

Everest Carburetters, COVENTRY

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Leaky Cylinder Head.

I have a 1913 model 2¾ h.p. four-stroke motor cycle with a detachable cylinder head. Will you please let me know the remedy to stop the leakage of lubricating oil from this point?—S.N.P.

The joints of the cylinder head should be clean and true, and a copper and asbestos washer fitted. If one is not enough, try two. See that the holding-down bolts are screwed tightly and evenly, so that the strain on each is equal.

Two-stroke v. Four-stroke.

I have heard that the J.A.P. engine is a four-stroke. If so, is this better than a two-stroke? What is the meaning of the term?—NOVICE.

You are quite right, the J.A.P. engine is a four-stroke. Briefly, the difference is this. A four-stroke engine has an explosion every four strokes, *i.e.*, two complete revolutions of the flywheel, while a two-stroke has an explosion every revolution of the flywheel. The four-stroke is more flexible and better understood than the two-stroke, but the latter has fewer working parts, and develops considerable power at low speeds.

No Compression in Front Cylinder.

I should be glad if you would put my mind at rest. I have a 2¾ h.p. Douglas, and I never seem to have a good compression in the front cylinder. It sounds as if the compression escapes into the crank case. I cannot pull the engine over the compression in the back cylinder, but can do so easily on the front. I have just fitted new piston rings with but very little improvement. Is this because the back cylinder gets more oil than the front? I cannot find any signs of a crack anywhere, and the machine takes me up any hill without trouble, but will not pick up speed on the level on opening the throttle.—A.M.

We have had considerable experience with the machine mentioned in your letter, and have never suffered from a similar trouble. The engine never seemed to have very much compression, but it pulled well despite this. Probably matters will improve when the new piston rings have become run in. Try fitting a smaller jet. We take it for granted that you have made sure that there is no leakage past the valve seatings.

Shaft-driven Motor Cycles for the War Office.

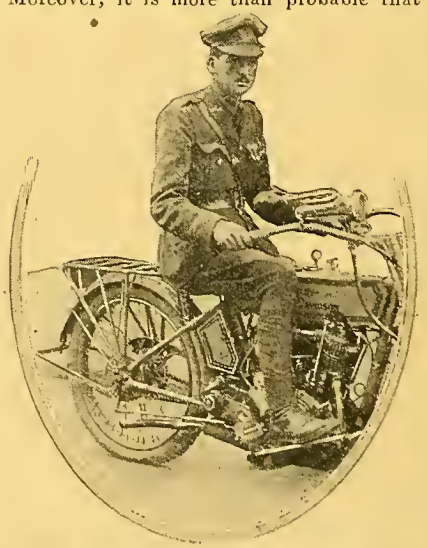
Has the Triumph Cycle Co. made for the War Office a machine which is shaft-driven all through?—CLYNO (Active Service).

To the best of our knowledge no shaft-driven motor cycle has been made for the War Office either by the Triumph Cycle Co. or any other firm.

Increasing the Speed.

I am the owner of a 1909 3½ h.p. machine which is capable of doing 55 m.p.h. with ease. I call this exceedingly fast, considering everything on it is absolutely standard, including a 32 jet. I am anxious to see what this machine can do. (1.) How should I proceed to time it for speed? (2.) Can I run with only one piston ring? (3.) What difference will this make?—W.C.H.

(1.) You could fit a large jet and arrange for more air, and possibly advance the magneto slightly. (2.) A single piston ring will diminish friction slightly. (3.) You might reach a speed of 58 or 60. We are, however, of the opinion that you will be most unwise to upset the present settings of such a first-class machine, except as an experiment, more especially since complete satisfaction is obtained. Moreover, it is more than probable that the results obtained from any alterations or additions to the machine would result in dissatisfaction in general riding. A speed of fifty-five miles per hour for a machine of this date is, we think, exceptionally good.



Lieut. Bicknell, of the 2/5th Gloucesters, on his 7-9 h.p. Harley-Davidson.

Adjustments for Touring.

My machine is a 3½ h.p., 1911, two-speed gear, with a light sidecar attached, and I shall be glad if you will say: (1.) How to time the engine to get the best results. (2.) What size jet should be used. (3.) Best magneto timing. (4.) Carburetter adjustment. (5.) How to obtain easy starting. (6.) Would a long exhaust pipe flattened at end, without exhaust box, comply with present exhaust regulations, pipe to extend just beyond back wheel? I want to obtain the best results for touring. (7.) How far down the cylinder should piston have travelled before exhaust valve opens?—G.H.

(1.) The most satisfactory timing for ordinary riding is as follows: Piston on dead centre (top), exhaust valve just closed. Inlet valve to open immediately after exhaust has closed. If the valves are set in this manner the closing of the inlet and opening of the exhaust will come automatically correct. This timing will be found best for ordinary touring conditions, but it is, of course, possible to obtain better results for speed with special timing, which can only be found by experiment on each individual engine. (2.) Standard Triumph jets about 30 and 32 will be found most suitable. (3.) Piston on dead centre (top firing stroke), contact breaker two-thirds advanced. (4.) Standard setting, viz., 32 jet, petrol level rising to within $\frac{1}{32}$in. from jet orifice. (5.) To obtain easy starting and good running make sure all parts are clean and adjusted correctly, *i.e.*, valves ground in, cylinder and piston free from deposit, valve springs in good order, carburetter adjusted as in No. 4, contact breaker clean (points separating not more than $\frac{1}{32}$in.), plug points clean and not too far apart (about $\frac{1}{32}$in. to $\frac{1}{16}$in.); compression must be good. (6.) No; a flattened exhaust pipe does not comply with the law, which insists on an expansion chamber or silencer being inserted between the engine and the outlet pipe. (7.) The exhaust valve should commence to open when the piston is about half an inch from bottom of stroke.

Tappet Adjustment.

Q. Will you please advise me on the following: My 3½ h.p. (single-speed) has recently been overhauled by the makers. When starting it clicks (it is not a knock), the sound seems to come from the tappets. When speed is gained the sound stops, but on slowing down it comes on again. I have tried all nuts, but have not had the timing case off. I might add I use plenty of lubricating oil.—AB 2175.

A. The noise you are troubled with is in all probability caused by the clearance between the tappets being too great. When the engine is worn the clearance should be about the thickness of a visiting card. Also see that there is plenty of oil in the timing gear.

Benzole for Two-strokes.

Q. I have a 1915 2½ h.p. single-speed two-stroke, geared about 5¾ to 1. I should be glad if you would be good enough to inform me on the following points: (1.) Do you consider benzole a suitable fuel? Is there any truth in the statement that it causes the engine to run hot? (2.) What would you say my petrol (or benzole) consumption ought to work out at per gallon? At present I do not think I am getting more than 65 m.p.g., and I always drive on full air. (3.) At a steady speed of, say, 17 or 18 m.p.h., would you say that an oil (drip) feed of rather more than one drip per second was excessive?—P.C.H.

A. (1.) Benzole can be used quite satisfactorily. In two-strokes you will not find it run hotter than petrol, provided you get the air supply to the carburetter correctly adjusted for it. (2.) There would not be a great difference in the consumption, though it is probable that you would do a greater distance on benzole. Your consumption at present is rather high. You would probably do better with a slightly smaller jet. You will require a smaller jet for benzole than for petrol. (3.) The quantity of oil you mention should be about correct. Provided blue smoke does not issue continually from the exhaust you are not over-lubricating.

Repairing a Tube.

Q. Just recently I experienced great trouble in trying to put a patch on an inner tube. I did everything possible, but could not get the patch to stick. I also took it to a garage, and the people there were beaten just the same. I then purchased a new tube, rode home, and discovered a small puncture. I tried to mend it, and had exactly the same trouble—could not get the patch to stick until it had stood all night. Can you explain the reason? I consider it is the nature of the tube. Can you suggest any method whereby I could patch a tube quickly, as a puncture on the roadside should not take many minutes to mend?—C.T.

A. The usual reasons for a patch not sticking are: Tube not clean and slightly roughed, patch old or dirty, solution not good. With a Patch Quick outfit or some similar outfit, you should have no difficulty in making the patch stick if you follow the following directions: Thoroughly clean tube with petrol, then rough it slightly with sandpaper, apply solution to tube and patch (not thickly), and allow it practically to dry, then if patch is applied and pressed into position with thumb and fingers you will find it will adhere. Be careful not to touch the solution with the fingers after it has been applied.

EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"A.B." (Bury).—Sociable sidecars of various makes. Comfort, wear on tyres, skidding, name of makers and price.

"A.H." (Coventry).—Grado multi-pulley. Is it severe on belts, and does the belt slip on the lowest gears?

"T.K." (Bath).—3¾ h.p. water-cooled Scott and sidecar. Hill-climbing, ease of starting, reliability, and general efficiency.

ROUTES.

PORTSMOUTH TO PLYMOUTH.—H.J.W.

Portsmouth, ferry to Gosport, Southampton, Totton, Cadnam, Ringwood, Wimborne, Bere Regis, Dorchester, Bridport, Lyme Regis, Colyford, Exeter, Chudleigh, Ashburton, Ivybridge, Plymouth. Approximately 160 miles.

FOREST HILL (LONDON) TO SWANSEA.—C.H.P.

Forest Hill, Dulwich Common, Christchurch Road, Clapham Common, Battersea, Upper Richmond Road, Twickenham, Staines, Ascot, Wokingham, Reading, Newbury, Hungerford, Marlborough, Beckhampton, Calne, Chippenham, Acton Turville, Chipping Sodbury, Iron Acton, Pilning, train to Severn Tunnel Junction (this passage is quite easy, the service is good, and the charges are reasonable), Newport, Cardiff, Bridgend, Aberavon, Neath, Swansea.

NEWPORT TO BLACKPOOL.—E.I.

Newport, Pontypool, Abergavenny, Hereford, Leominster, Ludlow, Craven Arms, Church Stretton, Shrewsbury, Wem, Whitchurch, Tarporley, Warrington, Wigan, Preston, Lytham, to Blackpool; approximately 190 miles. To avoid the manufacturing towns of Warrington and Wigan, follow road signposted by the R.A.C. beginning on the outskirts of Warrington and continuing through Rainhill, Prescot, Rainford, Ormskirk, Rufford, to Preston.

KIDDERMINSTER TO INVERNESS; also distance.—J.M.M

Bridgnorth, Wellington, Crudgington, Hodnet, Whitchurch, Tarporley, Eaton, Stretton, Warrington, Newton-in-Makerfield, Brighton, Wigan, Preston, Garstang, Lancaster, Carnforth, Kendal, Shap, Penrith, Carlisle, Gretna Green, Ecclefechan, Lockerbie, Beattock, Crawford, Abington, Lanark, Carluke, Newmains, Airdrie, Denny, Stirling, Perth, Dunkeld, Pitlochry, Blair-Atholl, Dalnaspidal, Dalwhinnie, Kingussie, Aviemore Station, Carrbridge, Freeburn Inn, Daviot, to Inverness. Approximate distance, 450 miles.

TWO-STROKE MACHINES IN THE R.N.A.S.

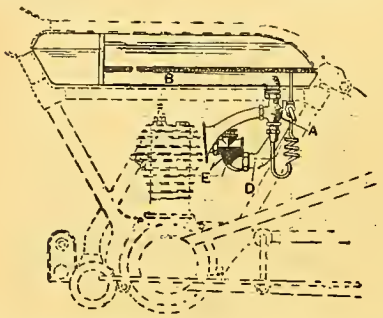
An imposing group of thirty Scott motor bicycles, with a background of R.N.A.S. lorries, photographed somewhere in the Near East.

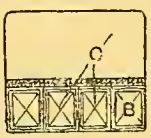
PATENTS

BY ERIC W WALFORD.

An Interesting Vaporising System.

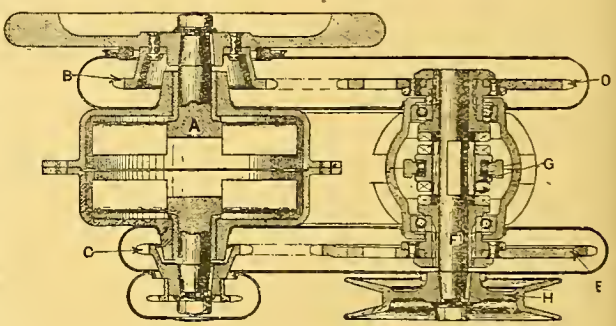
In the specification it is pointed out that the air passing to the engine can only absorb a certain proportion of petrol, and that, consequently, any excess of petrol supplied passes through the engine uselessly. To overcome this and obtain a saving of fuel it is proposed to supply petrol from the tank to a carburetting chamber A, which, instead of being in direct communication with the inlet pipe, leads to a series of conduits B arranged in the lower part of the tank. The small sectional illustration shows four conduits. These lie longitudinally along the tank, and are connected at their ends so as to form a long tortuous passage. The interior of the passage is lined with some absorbent material such as Turkey towelling, the material being formed into a tube or stocking and held in a partly distended condition against the sides of the conduits by X-shaped strips C which fit the corners of the conduits. The end of the conduit remote from the entry of the carburetted air communicates, by means of a pipe D, with a chamber E containing a throttle and an extra air valve, from which the mixture passes to the engine. It is stated that by passing the carburetted air through the lined conduits any excess of petrol is absorbed, so that the ingoing charge is of such a nature that it is completely consumed and no waste occurs.—E. R. Godward, No. 12,930, 1914.





An Engine and Gear Unit.

With the engine is combined a countershaft which can be driven at either of two speed ratios. Revolving with the crankshaft A are two chain sprockets B C of different dimensions, transmitting their motion by chains to corresponding chain wheels D E mounted upon sleeves revoluble upon the countershaft F. Either of these sleeves may be clutched to the countershaft by the sliding dog clutch member G, thereby transmitting the motion, according to the ratios of the particular sprockets engaged, to the belt pulley H.—F. A. Kimberley and the James Cycle Co., Ltd., No. 26,424, 1913.



An Attractive Show Card.

The makers of the Abingdon King Dick machine have issued a well-designed showcard. A picture of a King Dick sidecar outfit is the prominent figure.

Grease and Oil Injectors.

Messrs. Arthur R. Price, Vevo Works, Park Lane, Birmingham, inform us that thousands of their three-spout grease and oil injectors have been ordered for war purposes by the Government.

Abingdons in London.

We are informed that Messrs. G. H. Smith and Co., 12, Mortimer Street, W., are agents for the Abingdon motor cycles and sidecars, which can be seen at this address.

Changes of Address.

The new address of the New Ryder Motor Cycle Co., Ltd., is 76, Belmont Row, Birmingham.

The business of the H.S.M. cycle car will in future be handled entirely by the manufacturers, the H.S.M. Manufacturing Co., from 97, Besson Street, New Cross, S.E.

War Effects on Trade.

While speaking generally the motor cycle trade is in a flourishing condition, there are instances in which the war has caused the downfall of certain firms, especially those in a small way of business. A typical example is the case of a man we know, whose accessory business has practically dwindled to nothing as a direct result of the war. He is a trained engineer, and altogether a thoroughly good man, with a good knowledge of the trade, so he should have little difficulty in finding a berth where his services would be appreciated. Any firm needing such a man will be put into communication with him on application to the Editor.

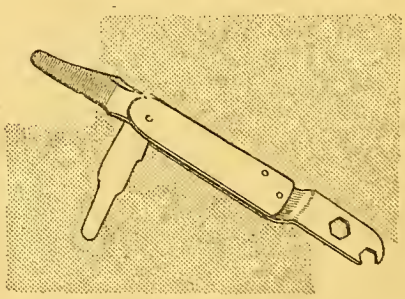
SPARKLETS

The H.D. in 1916.

Mr. Victor Welsford returned from the U.S.A. last week, and we understand that he will shortly be issuing details of the Harley-Davidson programme for 1916, which at this early stage is fully arranged.

Catalogue Received.

Alldays motor cycles. This catalogue shows the details of the Allon two-stroke, and the 3½ h.p. and 6-8 h.p. machines. Alldays and Onions, Fallows Road, Birmingham.



A neat and handy little magneto knife, recently placed on the market by Messrs. Ward and Goldstone, Sampson Works, Salford, Manchester. It comprises a magneto spanner, a contact file, and a gauge for setting the platinum points.

Books Reviewed.

"Aluminium Facts and Figures." British Aluminium Co., 108, Victoria Street, E.C. This little booklet contains much valuable information to those working in aluminium.

"Staffordshire." W. Bernard Smith. Cambridge University Press. 1s. 6d. An interesting, well written, and well illustrated guide book of Staffordshire, dealing with the county from a geographical and historical point of view. It is printed on art paper.

Three of the "Handy Homeland Handbooks." The Homeland Association, Ltd. 1s. These are complete with maps, and are full of useful information. The books under review are of Dartmouth, Totnes, and the River Dart; Dorking, Leatherhead, and Ashtead; and the Council Official Guide to Barnstaple (3d.) These books are invaluable to the many motor cyclists who are engaged in touring in England at the present time.

"The Internal Combustion Engine." H. E. Wimperis, M.A., A.M.I.C.E., A.M.I.E.E. Constable and Co. 6s. 6d. A useful textbook for advanced students, dealing with the internal combustion engine in all its types.

"Motor Cycle Principles and the Light Car." D. Appleton and Co., 28, Bedford Street, Covent Garden. 6s. nett. An American book written in the American style, which gives a fund of information that can be generally obtained from English handbooks. It gives information on light cars, cycle cars, and motor cycles, and deals with a number of systems which are practically obsolete in this country. Dealing with spring suspension of motor cycles, two illustrations are given of the Indian system, fore and aft.

MOTOR CYCLES FOR SALE.

Auto-Wheels.

AUTO-WHEEL, good order, with spring attachment; £7/10.—Clare, 28, Worsley Rd., Farnworth. [X4162

AUTO-WHEEL, £9, n t run 400 miles, excellent condition.—Browne, 94, East Sheen Av., S.W. [1215

AUTO-WHEEL, just overhauled by makers, new Palmer tyre; £10/10.—Lamb's, 151, High St., Walthamstow. [1098

MOTOR CYCLES FOR SALE.

Triumph.

1909 Triumph, 3½h.p., 2-speed, F.E., wicker sidecar, engine thoroughly overhauled, lamp, horn, tools; £27/10.—Bell, R.E. Office, Mill Hill. 'Phone: 1886 Finchley. [X3702

1914¾ T.T. Triumph, 4h.p., Clincher de Luxe, enamel and plating perfect, lamp, horn, all accessories; after 8 p.m.; £41/10.—Milford, 23, Greyswood St., S.W. [X3704

TRIUMPH, 3½h.p., F.E., variable gear, new wicker sidecar, Jones speedometer, mirror, all splendid condition; £42.—24, High St., Collier's Wood, S.W. [1260

1914 Triumph, 4h.p., T.T., 3-speed, semi T.T. bar, lamp, horn, speedometer, little used, condition guaranteed as new; £53.—Robinson's Garage, Green St., Cambridge. [6867

TRIUMPH, 3½h.p., 1909, fair condition, tank and frame re-enamelled last year, Millennium 2-speed and free, back tyre good, front worn; £20.—J.W., 1, Heath Hurst Rd., Hampstead. [1069

TRIUMPH, 1913, 3-speed, cane sidecar, Lucas lamp, rear light, horn, Cowey speedometer, complete equipment, guaranteed perfect; £45.—Sergt. Harvey, R.E., Park Rd. North, Bedford. [X4098

1914 Triumph, 4h.p., 3 speeds, Millford sidecar, new Palmer tyre on back, new Dunlop on sidecar, new Pedley belt, in thorough condition; £55.—C. Hall, 62, Sumatra Rd., West Hampstead. [1044

1913 Trimph, free engine, semi T.T., new Dunlop tyres, P. and H. lamp set, long horn, Millar rear light, recently re-bushed and overhauled by Triumph Co.; £33.—Walbro' Motors, Ely, Cambs. [X4128

TRIUMPH, 1913, free engine, all accessories, and spares, including belt, 2 inner tubes, and cover, just overhauled by makers, perfect; £35, nearest offer by August 30th.—C. F. Lambard, Ashbourne. [1017

TRIUMPH, 3½h.p., 1911, 2-speed countershaft, drip feed, new P. and H. lamp set, trip speedometer, condition perfect; any examination; £27.—Pinkerton, 50, Peak Hill, Sydenham, or 'phone Avenue 976. [1121

1911 Clutch Triumph, following new: Cylinder, piston, tappets, valves, Palmer, F.E., hub, and belt; good head light, spares; absolutely reliable; £30.—Bedford Villa, Fuller's Rd., Woodford, Essex. [1071

TRIUMPH, 3 speeds, and collapsible sidecar, accessories, all in splendid condition, £55; clutch Triumph, Palmer cords, speedometer, in good condition, £28.—Hazel Motors, 24-28, Woodford Rd., Forest Gate, E. [1168

TRIUMPH, Sept., 1913, Sturmey-Archer, fitted Gloria cane sidecar, recently overhauled, in perfect condition, good tyres, Lucas lamp, and horn; £46, or change higher power; private.—7, Wastdale Rd., Forest Hill. [1223

V.S.

5-6h.p. V.S. Combination, 2-speed, free engine, splendid condition; £25, or exchange Scott, Triumph, or Douglas.—Stone, 274, Gloucester Rd., Horfield, Bristol. [1225

Werner.

WERNER, 2½h.p., splendid running order, just completely re-bushed and overhauled, costing £5, late 1914 Amac, U.H. mag., tyres good, Whittle, lamps, spring forks, etc., 100 m.p.g.; great sacrifice, £12/10, or nearest.—Hayes, 55, Warren Rd., Torquay. [X4315

Williamson.

WILLIAMSON, 8h.p., Canoelet sidecar, good tyres; £38.—9, Waldegrave Rd., Teddington. [1058

WILLIAMSON New 8h.p. Water-cooled Sidecar Combination; £99/5; exchange quoted.—Motories, 68, Horton St., Halifax. [0706

WILLIAMSON Combination, 1914, done 4,000 miles, just been overhauled, fitted with new tyres, splendid condition; £62/10.—Simpson, Chemist, Brighton. [X3945

1914 8h.p. Water-cooled Williamson Combination, screen, accessories, and spares, as new, just overhauled; £70, no offers.—40, Eviugton Valley Rd., Leicester. [X4119

WILLIAMSON (September, 1913) 8h.p. w.c. Motor Cycle, coachbuilt sidecar, speedometer, screen, easy starter, spares, new condition, little used; £58/10, or nearest offer.—Rothwell's Boot Stores, Stacksteads, Rossendale, Lancs. [X4158

Win-Precision.

WIN-PRECISION, 1914, und sidecar, coachbuilt, 3¾h.p., 3-speed, heavy Dunlop; £40.—48, Evering Rd., Stoke Newington. [1051

Wolf.

WOLF 2½-3h.p. 2-strokes, three in stock; £25/8.—Lamb's, 151, High St., Walthamstow. [1096

WOLF, 1915, 2½-3h.p., 2-stroke, only had little use; £21/10.—Adelaide Motor Co., 84, Chalk Farm Rd., N.W. [1212

Yale.

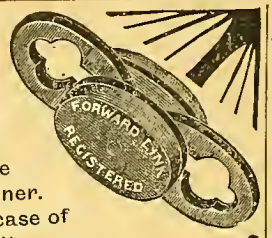
YALE Motor Cycle in stock, 8h.p., 2-speed, kick start; 60 gns.—Jones, The Broadway, Muswell Hill. Sole agent for N. London, trade and retail. 'Phone: Hornsey 2562. [7636

Zenith.

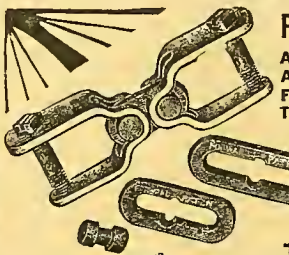
ZENITH, 1912, 6h.p., with sidecar; £25.—Dr. Mullock, Southwold. [9971

ZENITHS, 8, 6, 5, 3½h.p., best sidecar machines extant.—Timmons, Mansfield. [X4170

FORWARD LEATHER COVERED LINK should be carried by all users of the Forward fastener. Invaluable in case of too short a belt.



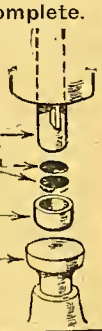
1/- from all agents.



FORWARD ADJUSTABLE BELT FASTENER. The most popular and strongest fastener in the world.

1/6 complete.

FORWARD VALVE STEM ADJUSTERS



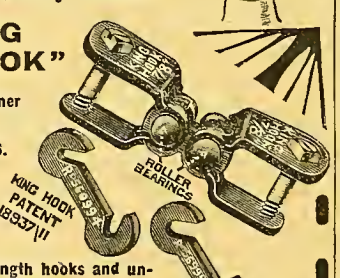
Made in three sizes, 5/16, 3/8, and 7/16

6d. set of four.

1/- set of eight.

With quantity of discs.

"KING HOOK" The super hook fastener with **ROLLER BEARINGS.**



Double strength hooks and unbreakable screws.

1/- detachable. **1/3** adj.

"KING HOOK" leather covered links, **10d.** each.

"CHAMPION KNUT,"

An exceptionally strong and reliable fastener at a popular price. Guaranteed to give complete satisfaction.

9d. detachable. **1/-** adjustable.

FORWARD MOTOR CO.,

SUMMER ROW, BIRMINGHAM.

Makers of **FORWARD BRITISH PLUGS.**

MOTOR CYCLES FOR SALE.

Zenith.

1914 Zenith-Green, with cane sidecar, not ridden 300, all spares; £51.—Jarmain, Harwich. [9968

ZENITH, 1913, 3½h.p., Gradua, and sidecar, in splendid order; £37.—P. Corby, 88a, High St., Merton. [1014

A BRAND New 1915 Zenith Combination, 8h.p.; £106.—Box 9,116, *The Motor Cycle* Offices, Coventry. [X4300

1915 Zenitha.—Immediate delivery from stock of most models.—Alexander's, 115, Lothian Rd., Edinburgh. [1245

6h.p. Zenith-Gradua Combination, clutch, and kick starter, speedometer, accessories; £60.—R. Davis, 14, High St., Biddulph. [X3703

1914 6h.p. Zenith, new underslung cigar shape sidecar, good condition; bargain, £54.—683, Leytonstone Rd., N.E., Essex. [1049

ZENITH, 1913, 6h.p., clutch, kick-start, Canoelet sidecar, all on; £45.—Seen at Stag Motor Works, East Finchley, London, N. [1123

1913 Zenith-Gradua 6h.p., clutch, kick starter, only 2,800, absolutely like new throughout.—Parkinson, Builder, Chatteris. [1267

ZENITH, 1912, 3½h.p. Jap, Gradua gear, Bosch mag., thoroughly sound; £30.—P. J. Evans, John Bright St., Birmingham. [1155

ZENITH, 4-5h.p., 1915, countershaft model, new condition, ridden under 200 miles; £60.—28, Lindsey Rd., Bishop's Stortford. [X4333

ZENITH-GRADUA, 4h.p. J.A.P., sidecar, P. and H., exhaust whistle, horn, new Dunlops on back, reliable; £35.—Nicholson, Butcher, Barking. [9922

ZENITH, 1914, 4-5h.p. twin, and 1914 sidecar, speedometer, new condition; £48.—B. Stone, 28, St. Ann's Rd., Burdett Rd., London, E. 'Phone: 65 East. [9996

ZENITH-GRADUA, 1914, 5h.p. twin, excellent order and condition, horn, lamps, plugs, tools, new tyre back; £48.—Particulars, Tom Simpson, Hatter, Stalybridge. [9977

1912¾ Zenith, 3½h.p., new tyres and belt, J.A.P. engine, with speedometer, lamps, and Montgomery sidecar; £32/10, good condition.—Trimm, Summer Rd., East Molesey. [9995

ZENITH 8h.p. 1914 Combination, clutch, Gradua gear, Cowey, lamps, fully equipped, as new; bargain, 48 gns.; appointment.—37, Shernhall St., Walthamstow. [1065

ZENITH, Zenith, Zenith, 1914, 8h.p., 90×77½, Millford coachbuilt sidecar, and all accessories; £65, or offer.—Cass's Motor Mart, 5, Warren St., Euston Rd., W. Museum 623. [1149

ZENITH-GRADUA, 1913½, 6h.p., and Millford Corvette sidecar, semi T.T. bars, lamps, horn, speedometer, spares, carefully used, fast; £45.—10, Netherton Rd., St. Margaret's, Twickenham. [1008

1914 Zenith Combination, Gradua gear, countershaft, and kick starter, in good condition, 3 lamps, speedometer, and spares, and accessories; £54.—Rhiewbank, Kentish Rd., Belvedere, Kent. [9999

ZENITH-GRADUA, 1913½, 4h.p., clutch, kick start, lamp, horn, whistle, tools, Swan sidecar (nearly new), insurance, very smart turnout; £41, or sell separately.—71, Muswell Av., Muswell Hill, London. [9974

1914 9h.p. Zenith-Gradua Combination, No. 7 Gloria, finished in red, excellent order, very fast, all accessories, £80; also light car chassis, complete with road wheels, gear box, steering, condition as new.—Plant, 7, Park St., Bow. [9982

ZENITH Gradua 1915 Models in Stock.—3½h.p. twin model B 59 gns., 4-5h.p. model D 62 gns., 8h.p. model H 73 gns. plus 5% increase; sidecars in stock; exchanges, extended terms.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0481

1915 6-10h.p. Zenith-Gradua and torpedo sidecar, only done a few hundred miles, absolutely in perfect condition, and guaranteed as new, all accessories; cost £108.—For inspection and trial run apply, West Lodge, St. George's Hill, Weybridge. [X4087

ZENITH 1915 countershaft models, delivery from stock: 3½h.p. twin, model B, 60 gns.; 4-5h.p., model D, 64 gns.; model H, 8h.p., 74 gns., plus 5% surcharge; sidecars in stock to fit; exchanges or extended terms arranged.—Elce and Co., 15, Bishopsgate Av., Camomile St., E.C. [0492

Ladies' Machines.

1913 Lady's Douglas, condition as new; £38; any trial.—Nixon, Brampton, Cumberland. [X4112

LADY'S Forward Motor Cycle, 1914, 2¾h.p., 3-speed; £25, or near offer.—Kent, Terminus Buildings, Seaford, Sussex. [X3941

LADY'S Hobart 2¾h.p. Motor Cycle, 1914 model, re-enamelled and overhauled by makers, in perfect order; £35, or near offer.—Glenroy, Walsgrave Rd., Coventry. [X4302

LADY'S Late 1914 Douglas, Lucas lamp, horn, and accessories, perfect condition, unsoiled, only done 400 miles; buying combination; £48/10.—Blackwell, 3, Leicester Terrace, Northampton. [X4178

Miscellaneous.

N.S.U., 2¾h.p., free engine; 1914 Connaught, 2¾h.p.; both good condition, ready for the road; £20 each.—Hunt, Settle. [X4229

Eliminating Weaknesses.

A FEW weeks ago a suggestion was made in these columns that motor cycle experts might well be appointed by the Government to study the conditions under which motor cycles are used at the Front and report upon any desirable alterations or amendments in design. Such an obvious course, it might be argued, has already suggested itself to the powers that be; it may have been, but we have our doubts, judging from the information constantly reaching us. For instance, a certain popular make of motor cycle used by the army at the Front has given constant trouble in one outstanding particular, and it is now quite an ordinary thing to see such machines running about with certain important parts, such as fork, wheel, and hub, taken from another make of machine. There is nothing very serious in this, it is true, if we have an abundance of mechanics with nothing else to do but to effect the alterations and an inexhaustible supply of parts, but such really is not the case. Now it must be understood that we are not necessarily taking to task the firm whose machine has needed the attention to which we refer. It would indeed be a miracle if no single machine at the Front failed to develop some little weakness in view of the extremely severe conditions under which it is regularly used. The *pavé*, the badly cut up roads due to abnormal traffic, and the constant riding over the roughest tracks are bound to tell their tale, but what does astonish us is the fact that this trouble has been allowed to continue so long. It was last autumn when the weaknesses in motor cycles selected by the Government began to make themselves manifest, and we contend that there has been ample time in the interim to strengthen up or amend the design of any faulty part. Manufacturers at home may have some idea of what is needed, but only experienced men on the spot can state authoritatively that this or that is wrong for the exceptional conditions, and demand a rectification of the error in future consignments of machines. One hears frequent cases of the frame of a certain make of motor cycle giving out, other cases of fork weakness, and so on until one wonders when engineering skill will be called in to rectify these weaknesses. This is where expert advisers could minimise tremendously the work of the mechanics of the Army Service Corps.

Motor Cyclists and Compulsory Service.

FOR some months past a section of the daily press has been urging the Government to adopt compulsory service forthwith, and without necessarily expressing a diverse or favourable view of this national movement, we should like to make it known far and wide that, so far as motor cyclists are concerned, to urge compulsion at present is rather beside the point. There is no dearth of applicants so far as this patriotic section is concerned. For months past our efforts have been taxed to the utmost in coping with the applications we have received from prospective recruits, and we go so far as to say that were motor cyclists treated in a businesslike manner, and in a manner they expect to be treated, the numbers would be increased threefold. We refer mainly to anomalies in the matter of payment. We have dealt with the subject before, and, as our readers know, it is not a question of the low rates of pay—for that matter the British Army is, as a rule, very well paid—but the inconsistencies of paying different rates to motor cyclists performing exactly the same kind of work. The rates for motor cyclists vary from 1s. 2½d. to 6s. per day, depending upon the section, which every reasonable man will agree is absurd; all car drivers get 6s. per day, and frequently a man whose experience is just insufficient to pass him as a car driver has to accept pay but one-fifth of the amount. Before there is compulsion we contend that the first move is to equalise the rates of pay.

An index to the advertisements in this issue will be found on the page facing the back cover.

The Variable Pulley Countershaft Speed Gear.

A DESIGN WHICH IS FREQUENTLY RESUSCITATED.

MANY readers will remember that in the days of the tricar boom, about 1904, there was produced a gear invented by Captain Low (named, I believe, the Lindsay-Low gear, and shown at the Stanley Show), which then looked like solving the problem of variable speed and transmission, but unfortunately experience with this and subsequent gears of the same type has shown that, although very good in theory, there are practical objections in the case of its application to a motor cycle which prevent it being very successful.

A diagram making clear the operation of this gear is shown in fig. 1. Between the engine and the rear wheel, which is represented by the circle A, is a countershaft B, which swings on an arm C controlled by a speed lever D. The countershaft carries two fixed pulley flanges E and F and a sliding flange G, both sides of which are bevelled the same as the flanges E and F. On each side of the sliding flange G there is consequently a belt pulley, the diameter of which varies according to the position of the flange G along the countershaft. In the sectional view the right-hand pulley is of large diameter and the left-hand one small. By moving the flange to the left the diameters of the pulley grooves change.

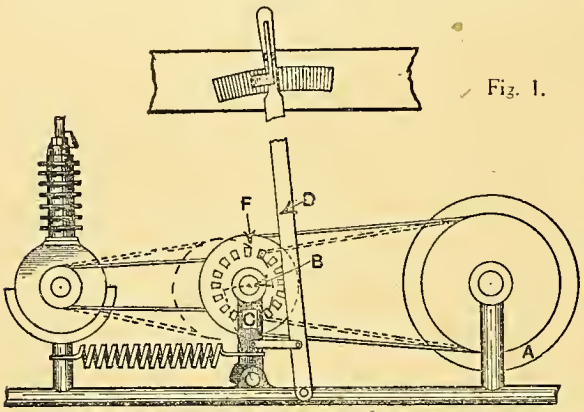

Fig. 1.

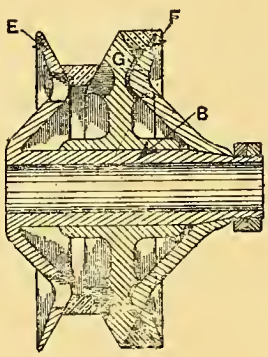

Drawings from the patent specification of the Lindsay-Low gear

In full lines in the larger diagram the engine is shown as driving on to the small pulley of the countershaft, and the larger pulley on this shaft drives the back wheel so that one has a high gear. By pushing the lever D forwards the dotted line position is reached in which a big double reduction of gear is obtained between the engine and back wheel. As the lever is moved forward the back belt tends to tighten and the forward one slackens off. The back belt, therefore, forces the flange over, and the diameters of the two belt grooves change to suit the relative tensions of the two belts.

Consequently this simple arrangement provides a gear which is gradually variable over a fairly large range, but the chief difficulty in applying this gear to a motor cycle is that one is compelled to use two short belts, and everybody knows that it is difficult to make a short belt stand up. Although one can demonstrate the practical operation of a gear of this kind, experience alone shows that serious trouble with belts ensues.

The belt line changes as the countershaft is moved forwards and backwards, and to overcome this various schemes have been suggested by later inventors. In patent No. 20,894 of 1909, granted to Messrs. W. E. and F. R. Lea, the whole countershaft was free to slide slightly, so that the positions of the pulleys automatically adjusted themselves and the correct belt line was maintained. A similar suggestion is made in J. A. Prestwich's patent No. 30,168, 1910, in which it is stated that the complete pulley could be made movable on the countershaft.

It will be gathered that this kind of countershaft gear is very attractive to inventors, and it is not surprising to find that it has lately cropped up again, the inventors being Messrs. W. W. and W. H. Wall, patent No. 25,050, 1912. Fig. 2 shows the compound pulley mounted upon the countershaft K. This is carried by one end of a lever L, the other extremity extending to near the top bar for operation by the rider. In this case, to move the pulley sideways to deal with the change of belt line the lever near its pivot engages a kind of cam M. These later inventors have apparently done nothing to overcome the difficulties previously experienced with the belts, and until one is assured that this has been dealt with I cannot see that this latest construction to come to light should be any more practical in the long run than its predecessors.

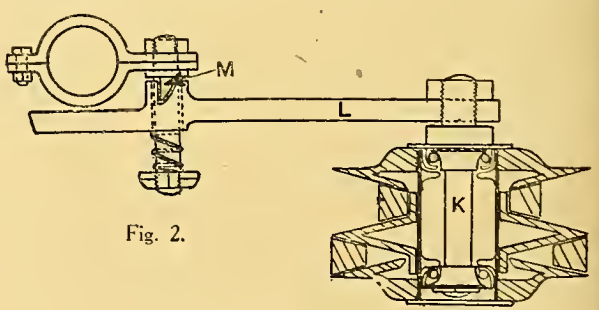

Fig. 2.

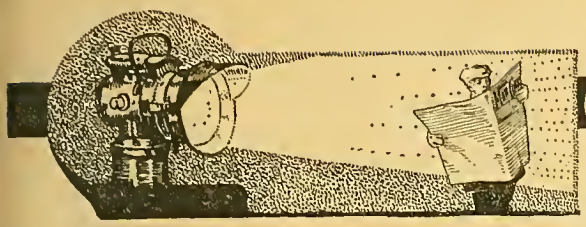
It may be of interest to mention that a gear of this kind, made some six years ago, is before me as I write, having been traced in a corner of my office, discarded as impractical in the limited space available on a motor bicycle.—E.

"The Motor Cycle" Photographs

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints half-plate, 1/6 post free; mounted, 1/9 post free. This refers to photographs taken by "THE MOTOR CYCLE" operators.

Orders, which must be accompanied with remittance should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street London, E.C.



Occasional Comments

"By Ixion"

Where Small Engines Score.

Nobody has laid sufficient emphasis on the vast superiority of small engines in respect of accessibility. I am a born tinkerer—eternally dismounting the mechanism of my machines, sometimes because they need it, sometimes because it is raining and I have nothing else to do, sometimes out of sheer curiosity and the wish to do justice to designers. But for all my enthusiasm I rather shirk the job of decarbonising the average big twin, and when I overhaul a 3½ h.p. single I am usually tempted to rest content with removing the cylinder, leaving the crank case *in situ* on the frame, because I know it is a heavy job to get a 500 c.c. engine back into a frame single-handed. But who minds whipping a baby two-stroke or other 2¾ h.p. power unit out of the frame? The all-round clearance is so great that you can be sure of getting it away with the minimum of labour and coaxing, and when it is out you can walk down the garden, carrying the engine in one hand.

The Swing-up Stand.

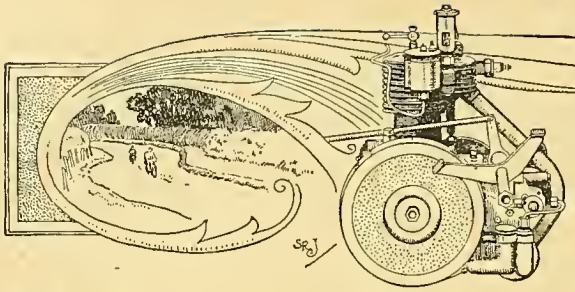
Is there a master patent in respect of the stand which raises itself by means of a spring when the machine is wheeled off it, of which the Rudge is an excellent example? Years ago, when our makers compelled us to stoop over the tail of our machines, and secure the stand by means of a dirty little wing nut (supposing it had not dropped off on the road) I penned many a vitriolic note in favour of the "kick-up" stand. I don't particularly detest the kick-up stand nowadays, but I am at present afflicted by a machine which has a fat place in the centre of its cross-bar, the fat place being guarded by projections at each end, and mounted so far out of centre that it just fails to register with the spring catch. As a consequence I have to stoop over the mudguard when I wish to fasten the stand, and meanwhile the exhaust extension spits carbon dioxide in my face. Thus I am pining for the spring-up stand, such as adorned my last Rudge. How many of my readers recall the old Price stand, which had two separate legs, each of which had to be disengaged from a spring catch individually, and hoisted up? What a chance for a little ceremonial in the M.M.G.S. if such stands were still in vogue. "Raising stands by numbers! At the word one, tilt machine away from you, right hand on the saddle peak. . ."

Double Clutch Control.

I have been trying a 1916 Harley-Davidson, and under ordinary circumstances should have bought one, as the design is extremely interesting, including such attractive features as combined hand and foot clutch control, mag-dynamo lighting-cum-ignition, and a carburetter which permits of 4 m.p.h. on top gear. But at a time when our imports vastly exceed our exports, it seems to be a point of honour with patriots to prefer home-built stuff, and so I owe my impressions of the "H.D." to the courtesy of a friend, whose conscience is less fastidious than mine about the national interests. Incidentally, the "H.D." does not seem inclined to shed its twiddly bits, after the manner of so many American machines. Yankee workshops appear to stock a curious brand of taps and dies, as their bolts and nuts tend to become frightfully loose after a tenth part of a turn; from this defect the "H.D." is certainly free. I was much taken with the combined clutch control. Hand control is certainly the goods for starts from rest, as you want your legs for propping up the machine while the engine is getting to work, especially when the machine is a 7-9 h.p. and scales the best part of 3 cwt. On the other hand, foot control is more convenient when once the outfit is on the move, as one hand is often absorbed with the engine control, and the other is needed for sounding a hooter. I recommend the dual control to British designers of heavyweights *de luxe*.

Spring Frames.

The leading publicists have not yet got busy on the benefits which war confers on nations in partial compensation of its frightful losses; but it is at least obvious that it should benefit motor cyclists in certain directions. In particular, it has so completely broken up our already inadequate road surfaces that the problem of spring frames is bound to be tackled when the industry resumes its normal round. My experience of motor cars seems to suggest that the countries with the worst roads invent the best car suspension systems, but the parallel does not apply to motor cycles, for America's roads are probably the worst in any civilised country, and the American motor cycle engineers have reached no unanimity on the springing question. The Indian, of course, is an example of what can be done, but the average Yankee maker is satisfied with a clumsy solution; he piles up engine power, which enables him to fit enormous car-size tyres and rims; and possibly he supplements these makeshift notions with a spring saddle pillar, often so crudely carried out that the saddle leather is constantly fouling some metal part of the frame. In England we are even less enterprising, and so far little or nothing has been attempted; the lethargy of American makers under even worse conditions suggests that the problem is very thorny. Much of my riding is done over roads corrugated by heavy gun and lorry traffic; and oddly enough, my greatest comfort this year has been attained with machines differing widely in design. My Baby Levis was genuinely comfortable over the bumps at speeds up to 30 m.p.h., but bucketed at higher speeds; and a 6 h.p. Ariel, with rather sloppily-inflated tyres, was delightful up to the same speed. At high speeds practically every machine I have ridden this year has been a real liver shaker, and made me sympathise with the American car racer who fitted shock absorbers between his teeth!



ELECTRIC LIGHT FROM A MAGNETO.

MR. PETTYT, of Maude's Motor Mart, recently gave us an opportunity of examining a magneto fitted up in accordance with a very ingenious scheme by its late owner, who is now a member of the R.N.A.S. The idea was to make the magneto available to supply current for lighting lamps or charging accumulators without rendering it useless for its original purpose.

To put this plan into execution, a drum was mounted on an extension of the armature shaft beyond the contact breaker. This drum, which is shown diagrammatically in the accompanying sketch, consists of three portions, of which Nos. 1 and 2 form the commutator. The commutator serves to change the alternating current of the magneto into a continuous current suitable for charging accumulators, while Nos. 2 and 3, electrically connected by a pair of brushes and a metal bridge piece, serve to regulate the supply of current to the commutator. The various brass segments are insulated from one another by insulating rings, and also by the insulating blocks. There is only one such block in segment 3, and its purpose is to interrupt the flow of current to segment 2, and thence from the external circuit to the accumulator for a short time before the separation of the points occurs at the contact breaker of the magneto. During the greater part of the revolution, the current from the primary of the magneto passes from segment 3 to segment 2, and thence to one or other of the brushes. The other of these brushes bears, meanwhile, upon segment 1, which is connected to the other side of the accumulator and to the frame of the machine, thus completing the primary circuit back to the other end of the primary coil of the armature. As the drum rotates, the brushes alternately bear upon segments 1 and 2. There are two insulating blocks, and twice in every revolution, at the time when the primary current is very low, the brushes cross these insulating blocks, and exchange segments with one another. The result is that each brush, instead of collecting an alternating current from the armature, collects a current flowing in one direction, and therefore suitable for charging a battery. This current, of course, is not steady, but rises and falls as the armature rotates. At the same time it conforms to the essential of not changing in direction. For a short time during every revolution, this current to the accumulators is interrupted altogether. This is when the insulating block on segment 3 passes under its brush and interrupts the circuit. If the current were free to flow to the cells at all times, the operation of the magneto for ignition purposes would be interfered with.

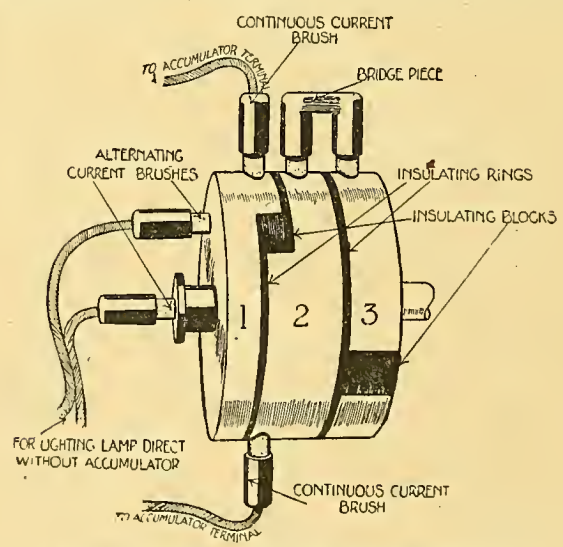


Diagram of commutator for converting alternating current of a magneto to continuous current for charging, as described in the accompanying letterpress.

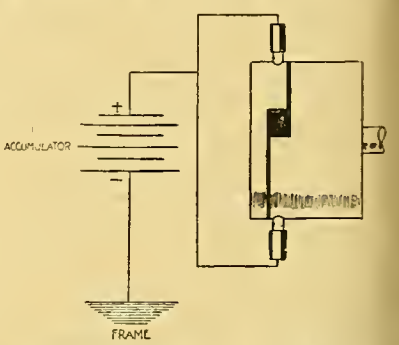

Diagram showing how the connections are made for charging. Both wires are connected to one terminal of the accumulator, the other terminal being earthed.

It occurred to the designer of this interesting apparatus, that it might be useful not only to be able to light lamps through an accumulator, but also to be able to keep a lamp burning when no cells were being carried. For the latter purpose, he adopted the simple method of fitting the two brushes A B, one of which draws off an alternating current from the insulated central screw. This current can be used for lighting a lamp, subsequently completing its circuit through the second brush A B bearing on the side of segment 1, and thus connected to the frame of the machine.

The device briefly described has been proved to work quite satisfactorily, both for charging and for direct lighting. When the former was going on, the magneto functions just as usual, but when lighting the lamps direct, it is more difficult to get it to fire at low speeds, owing to the interference with its ordinary functions by the circuit to the lamps. Separate switches are, of course, required to determine the flow of current along the two lighting circuits and the ignition circuit.

A Visit to a Signals Training Centre.

How Royal Engineer Despatch Riders are fitted out for Active Service.

IN our issue of July 15th we gave a short description of an R.E. Signal Station, and thanks to our kind friend through whose courtesy we were enabled to take particulars of this, we recently spent a still more interesting afternoon at the principal centre where those who enlist in the R.E. to do signal work receive their instruction. Naturally, a number of these men are despatch riders. The scene on this occasion lay in a beautiful country residence standing in its own grounds. In the house itself was the officers' mess and numerous class rooms, while nearly all the officers and the men slept under canvas in the park.

There is a fine village green outside the entrance gates, and at the time of our arrival over a hundred D.R.'s were being inspected previous to their departure for the Front. It was, indeed, a fine sight, as may be realised from the illustrations in our centre pages last week. The men were fully equipped with overcoats, map cases, revolvers, and were, in fact, in full field kit, while on the carriers were the usual large square box on which extra clothing rolled up was strapped. What a different outfit from that carried by the competition rider, who enters a long distance trial under "touring conditions"! With these he does not comply, but this cannot be said of the D.R. who goes to serve his country carrying very little more than the average motor cycle tourist who wishes to cover his journey with just sufficient for his comfort should take with him.

The machines were the latest pattern 2¾ h.p. W.D. Douglases and 4 h.p. Triumphs, and both they and the men looked extremely smart and businesslike. After an inspection, the men were drawn up in formation representing three sides of a square, and an elderly but smart Colonel, grown grey in the service of his country, addressed them and gave them friendly advice before starting on the event of their lives—their departure to fight for their King and the land they love so well. The address over, a sharp word of command rang out, and all rushed back at the double to their machines. These men were the finished article, and the order was executed with the alacrity one expects from the British soldier.

(Upper) Looking into the workshop at the despatch riders' training centre described on this page. In pre-war days the "workshop" was an outhouse of a country residence.
(Lower) Two old friends at the R.E. training centre—A. J. Sproston and A. Milner.

The hall was an ideal spot for a training centre. Its position and its beauty could not fail to appeal to the men, while the stables and outhouses, to say nothing of the courtyard, appeared to be made for the purpose. Each little outhouse was fitted up; most of them were workshops, while one of the stables had been ingeniously turned into a power-driven machine shop. The machinery consisted of a capital lathe, while the power was derived from a "dis-ed" (pronounced dissed) Douglas. In D.R. language the word "dis" is used to denote anything faulty or even scrapped. It has been borrowed from the R.E. Signal Service, whose men talk of a telegraph or telephone line being "dissed" when the messages are interrupted, meaning thereby disconnected. The frame of the Douglas had certainly suffered, and the poor little mount, minus front and back forks, resembled an old Motosacoche power unit as we remember it in the old days. It stood unclamped on a wooden box and drove the lathe by means of a long belt. It was started up for our benefit and did its work well. Its cooling was aided by means of two fan blades riveted on to the flywheel.

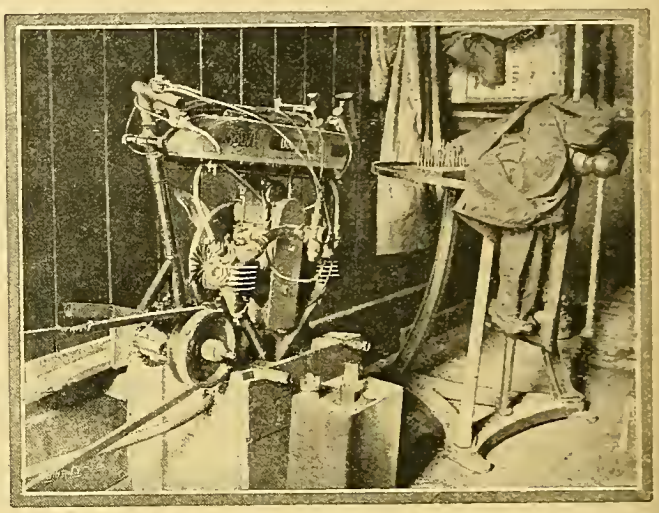
A Visit to a Signals Training Centre.—

In another part, a coach house was full of hard-working artificers, who were carrying out sundry repairs. Here we met two old friends, Sergeant Albert Milner, of Birmingham, and Corporal A. J. Sproston, of whose brave doings mention has already been made. We then had a stroll round the grounds and saw men receiving instruction in all the various phases of signalling. A visit to the stores was most interesting. In the spares department there was a stock which would almost have made some of our best known accessory dealers envious. Next to that was the clothing store, and a little further on a shed with the significant words "dissed bikes" chalked up.

A War Veteran.

Among the officer's "remounts" we saw a rusty old 1914 3½ h.p. three-speed hub gear Triumph, on which its name "Wind-up" was painted. What a tale that fine old stager could tell! It belongs to an officer who is one of the few survivors of the original signal company who went to France a year ago, and is about the only motor cycle which has lived through the whole campaign. The next shed was stocked with beautiful new machines not yet taken from their crates, waiting for the lucky D.R.'s to claim them.

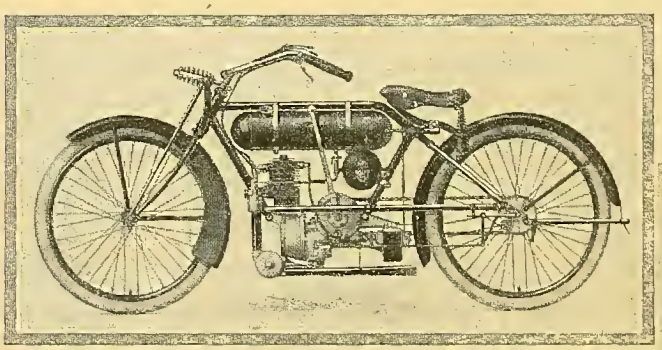
This concluded a most interesting afternoon, and left us deeply impressed by the feeling of what our favourite pastime was doing in serving King and Country.



The power plant in the "machine shop." Note the fan blade on the flywheel, also that the power unit is resting on the box without being clamped thereto.

The Two-stroke American Cleveland.

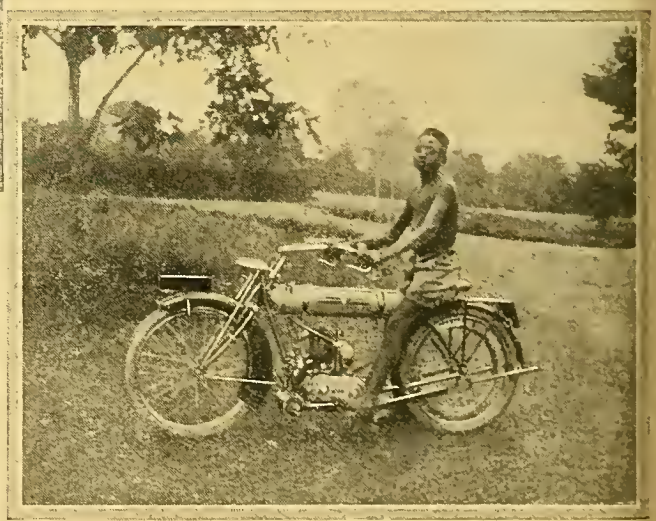
THE new two-stroke lightweight Cleveland, an American machine, particulars of which were given in *The Motor Cycle* of July 1st, 1915, page 6, has been remodelled and is now being placed on the United States market.



An American two-stroke lightweight, the Cleveland, which may shortly make its appearance on the British market. It sells in the United States for £30.

As we pointed out at that date, the Cleveland bears a very strong resemblance to a well-known Coventry machine, and the illustration of the marketed model as distinct from the experimental model does not lessen this impression. The design of the Cleveland is interesting as representing practically all that is good in British design plus American ideas in the unit system of construction and other notable details. Two-strokes, it may be interposed, are not generally favoured in America as yet, and the firm's announcement states that forty-three makes of two-strokes are on the market in England. To reiterate the essential details, the single-cylinder engine has a bore and stroke of 63.5 mm. × 70 mm. (222 c.c.). The crankshaft is longitudinal in the frame, and drives the two-speed gear by means of a shaft. A multi-plate clutch is located between the two-speed gear box and the driving chain to the rear wheel.

Modifications in the latest model illustrated consist of a dropped frame giving a lower saddle position and a straight exhaust pipe. Bowden control is adopted on this machine. The Cleveland sells in America at about £30. As American prices go this is rather high, partly explainable by the fact that it is about the first machine of its type.



A young Baganda chief (Uganda) and his two-stroke Triumph. The natives in that part of Africa are very keen on motor cycles, especially two-strokes, for as one chief said, "I like the two-stroke very badly, for it makes a good noise." We have to thank Mr. R. Freeman, of Kampala, Uganda, for the photograph.

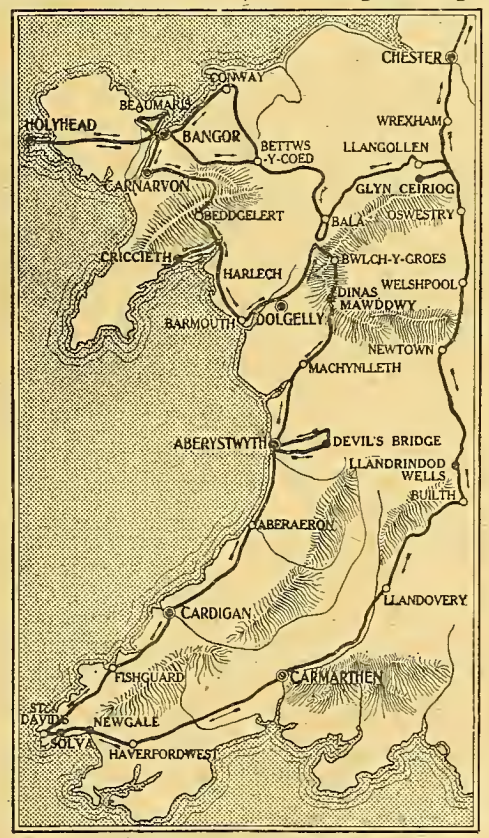
Through the Length and Breadth of Wales.

A Comprehensive Tour of 800 Miles.

A halt for tea by the side of Whitesand Bay, St. David's.

A LETTER arriving from the Zenith Co., to say "Machine despatched per passenger train," sent me in haste to Lime Street Station, Liverpool, where I found it covered in just one piece of brown paper, but quite safe and sound. I was soon riding home through the crowded streets, and was delighted to find that the big 8 h.p. was as easy to control as the 6 h.p. (if not easier) that had served us so well for over two years. The arrival of the new mount resulted in the planning of a holiday tour. After a few trial runs, the day arranged for the start arrived at last; this was a signal for the six weeks' spell of fine weather to break. We crossed the river from Liverpool to Birkenhead by the passenger ferry, the charge for the machines and passengers being only 8d.

After leaving Birkenhead, we covered the sixteen miles to Chester with but one stop to strap the luggage on more securely. Not until Chester was left behind did we feel we had really started. The roads to Rosset were very wet; then to Oswestry they were drier, but rather bumpy. After this, in spite of the rain, they were good. At Welshpool (sixty miles) we stopped for lunch. The weather clearing a trifle, we set out again, and, skirting Newtown, we were soon climbing the long twisting hill that leads to Llandrindod Wells. The road was of the scenic railway type. The Wells here did not impress us at all favourably. The modern red brick building seemed far too much in evidence. After putting in a gallon of benzole, which cost 1s. 8d. compared with 1s. 3d. in Liverpool, we proceeded through Builth, Llandovery, Llandilo, to Carmarthen, where we put up for the night, the distance for the day being 160 miles.



Route covered by the writer.

At breakfast we had a fish called sewin; it is a local fish caught by the coracle men. It was new to us, but was very similar to salmon. Before leaving, we rode to the river to inspect one of these remarkable little coracles. They are made of canvas and thin laths of wood tarred over, and are so light that they can easily be lifted on one finger.

The streets of Carmarthen are steep, narrow, and winding, which rendered driving somewhat tricky. We left by the Haverfordwest Road, which was in very good condition. It included a three-mile climb to Red Roses,

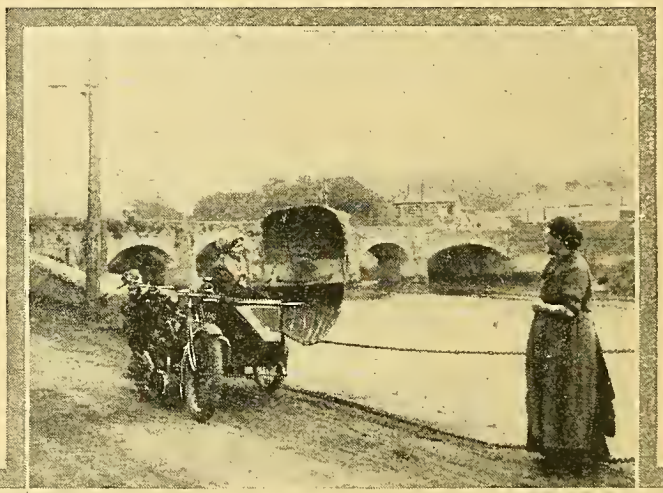
Through the Length and Breadth of Wales.—

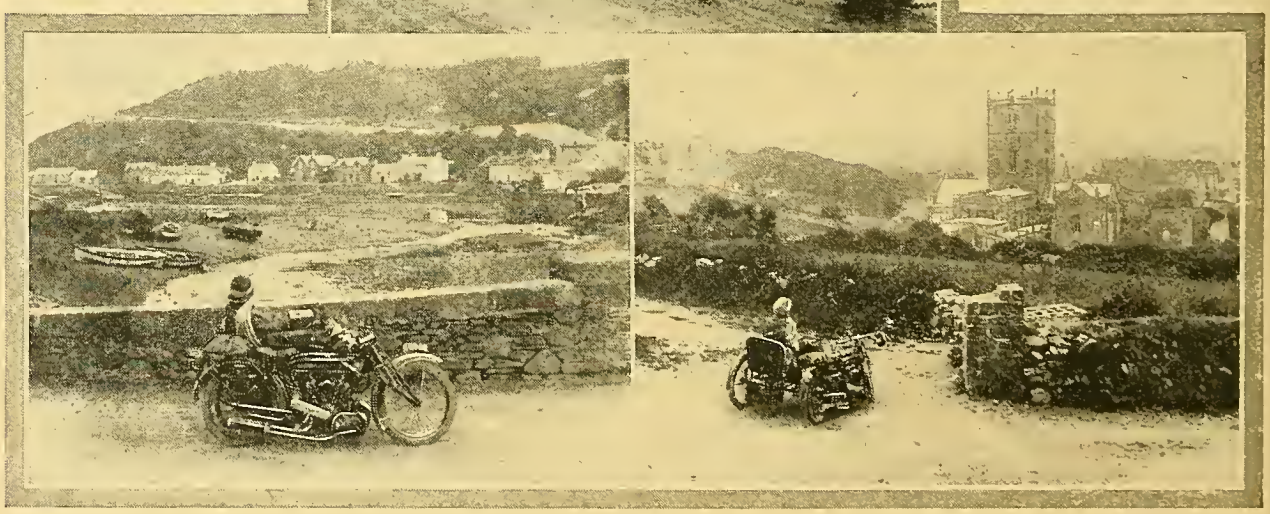
then a switchback to Narberth, where it was market day. Driving through the streets was rendered somewhat exciting by having to dodge the horses and cattle assembled for sale. Then a pretty run to Haverfordwest, with its castle on the hill top and the village clustered on the hillside below it. The High Street has a gradient of about 1 in 8, and is one of the steepest main streets I have ever seen.

The road after this was loose and undulating as far as Newgate, where it goes down to the sea and runs parallel with it, separated only by a 7ft. barrier of stones thrown up by the sea. The rise out of this bay was a real stunner, a hairpin bend and then what appeared to be about half a mile of 1 in 8. I got up pretty easily, but I should think any under-powered or over-geared machine would have considerable trouble in this district. Further on there was a steep hill into and out of that pretty little fishing village of Solva that made me feel thankful for the reserve of power we had.

IN SOUTHERN WALES.

Examining a coracle—a single seated fishing boat of extremely light construction. Carmarthen bridge in the background





Fishguard old harbour, showing new road in background leading up hill-side.

St. David's Cathedral and ruins.

An Interesting Cathedral.

The road to St. David's was good as a whole, though rather loose in parts. The approach to St. David's is up a long gentle hill, and our first glimpse of the cathedral was the sudden appearance of the top of its square tour, which seemed to shoot up out of the earth. The nearer we got the higher the tower became, until we topped the crest and looked down into a kind of basin with the cathedral and the splendid ruins at the bottom. Riding down to it required good brakes. We went in, and it seemed to be the quaintest cathedral in the kingdom. The inside is of a slate colour. The supporting columns staggered and splayed outwards at the top. Some old bells, and the stains on the floor where the bodies thrown up by the sea were laid, were all of interest to us.

The surrounding ruins took some little time to explore, but were well worth it. We left the cathedral with the soothed and satisfied feeling and effect which these grand masterpieces of architecture have on one. On reaching the motor we found the back tyre was flat. After repairing it we made for Whitesand Bay, about three miles distant, where we had a picnic tea and, seeming to have the whole world to ourselves, indulged in a bathe. We were so pleased with this far corner of Wales that we decided to spend the night here. Going for a walk after supper on the cliffs we were stopped by two soldiers who told us that no one was allowed there after 9 p.m.

The road to Fishguard was very difficult to follow as there were so few signposts, the surface, too, was bad, having been repaired by a quantity of loose flinty stones which were left for the traffic to roll in. Fishguard is not an inviting place, it is very similar to Holyhead. The old harbour is rather interesting, but the road down to it requires careful driving and good brakes. The rise out (northwards) by the new road is fairly easy.

I should like here to warn any reader contemplating a tour in this part of the country against taking the

6,943 miles— and not a puncture in either tyre!

A letter from William V. Pack, "Dale" Motor and Cycle and Electrical Works, Sunningdale, Berkshire:

"Will you please send me one 26 x 2½ Cover to fit 26 x 2¼ rim, the same as supplied to the Sunbeam Co. for 1914 3½ h.p. motor cycle.

"I mention this because I have had such good results with these fitted. I have now done 6,943 miles as registered by my speedometer, and have not even had a puncture in either tyre. I not only use my cycle for pleasure but for business purposes. I have a box carrier which holds 18 cans of petrol, so you will see that your tyres have some very rough usage.

"I want this new cover for a sidecar at present until it is needed for the cycle.

"Trusting you will send same by return."

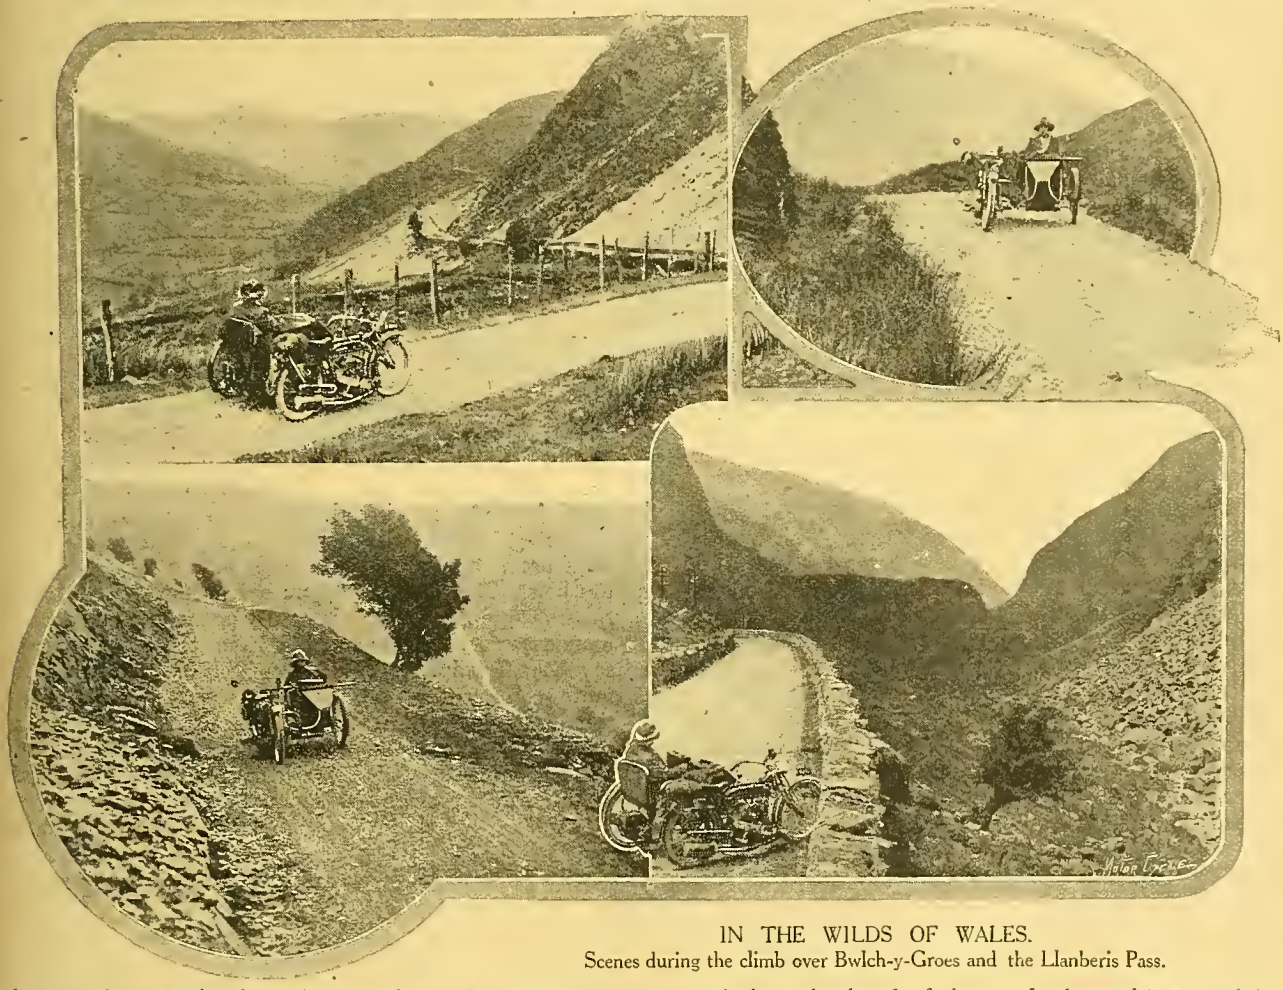
Through the Length and Breadth of Wales.—

coast road from Fishguard to Aberystwyth The roads are in a disgraceful state, full of pot-holes; also steep gradients and sharp bends abound. Neither does the scenery make it worth the trouble. The south-west coast is by no means the finest part of Wales. After we left Cardigan, a nail punctured the rear tyre, and, while engaged in the repair, the occupants of a two-seater car offered assistance. A mile further along the road we found the car with the near side wheels in the ditch. It was our turn to offer assistance. The car was apparently undamaged, so, with the assistance of a few local people, we had the car back on the road in a very few minutes. We



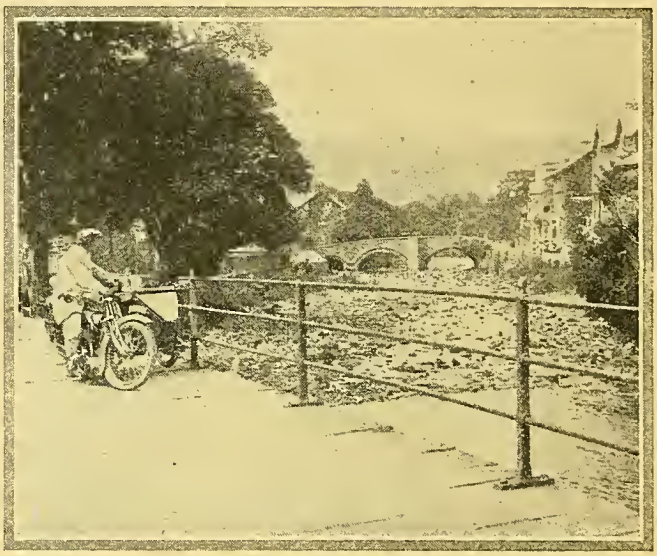
IN THE WILDS OF WALES.
Scenes during the climb over Bwlch-y-Groes and the Llanberis Pass.

then sped on again through the rain to Aberystwyth, where we elected to stay a couple of nights. On the second day, after a wet morning, the afternoon turned out bright, so we decided to get the machine out and do the circular tour of thirty miles to Devil's Bridge. This was a splendid top gear run up well engineered grades. The two hours spent exploring here are among the most pleasant recollections of our trip. No one should pass this way without paying Devil's Bridge a visit. Tiring of the seaside in the wet, we decided to make for Bala over the highest pass in Wales—the famous Bwlch-y-Groes. The few hours sunshine in the morning saw us cheerfully covering the miles between Aberystwyth and Machynlleth, but before we reached the village of Dinas Mawddwy the rain came pelting down and the thunder rolled; amid those wild hills the scene was most impressive.

Upon reaching the foot of the mountain we dismounted and walked round the hairpin bend to reconnoitre and decide the best way to negotiate the corner. Returning to the side convenient for the corner, it having a right hand bend, I attempted to take it fast, but it was no good; the weight of the luggage behind the sidecar when the machine was tilted on the gradient of about 1 in 5 lifted the front wheel, and it would not grip and bounced to the left; lifting the exhaust and applying the brakes saved us from sliding right into the ditch. I then let the machine run backwards into the bend of the road, then with a straight run sailed up in fine style. At the top we stopped to take a photograph, and as the rain had ceased we had a picnic. We seemed to be right on the top of Wales. The rain coming on harder than ever we coasted down the hill, having to open two gates *en route*, and took a photograph of the spot where Joe Edge, over two years ago, went over a precipice with an empty sidecar. Reaching Bala Lake we turned to the left and went *via* Dolgelly. About a mile from Barmouth we ran clear of the rain and entered that place with the water dripping off our oilskins, while ladies with sunshades up stared in astonishment. We still had a pint of benzole left from

Through the Length and Breadth of Wales.—

the gallon bought at Aberystwyth, and had covered a distance of seventy miles of heavy country, so I was naturally pleased with such economy. We put the machine up at Wilkinson's garage, where we received every attention, and the charges were the most reasonable found on the trip. The first fine day dawned as we left Barmouth for Harlech. Here we spent some two hours looking over the castle and basking in the sunshine on the walls. We then pushed on to Portmadoc. Before entering this town we were twice pulled up at toll bars and had to pay 9d. at each.



The village of Beddgelert.

The Most Beautiful Pass in Wales.

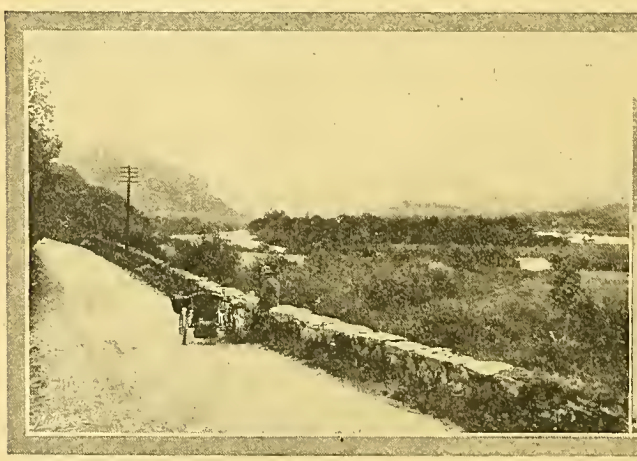
After crossing the embankment we entered the town and inspected the miniature railway that runs to Festiniog. From here we proceeded by a good road to Criccieth. The place was packed, as it was market day, so we drove on into the country, where we had a picnic far from the madding crowd, afterwards retracing our steps to Portmadoc and on to Beddgelert, *via* the Pass of Aberglaslyn. This pass is, to my way of thinking, one of the most beautiful in Wales. The colours and blending of tints on the mountain, with the Glaslyn sparkling below, make up a scene which it would be difficult to forget. The road is a good one, and though a long pull up, it is so well engineered that it is a comparatively easy climb.

Staying the night at Beddgelert, we walked to the supposed grave of Gelert, though it is now fairly certain that no dog was ever buried there. Next day we made a late start, being loth to leave so charming a spot. A nice run on top gear to the top of Llanberis Pass and a free-wheel run down brought us to old Llanberis, where we took a walk to see the waterfall. Then, circling Snowdon, we pulled up near the lake and climbed the hillside, after which we went on *via* Carnarvon to Bangor. From here we made trips to Holyhead (a splendid fast road), Bettws-y-Coed, Conway, etc. We made the return journey by Bethesda, Capel Curig, Bettws-y-Coed, Cerrig-y-Druidion, to Lake Bala, and after circling round this went on to Corwen, Llangollen, to Chirk, where we turned into the lovely quiet valley of Glyn-Ceiriog, staying the night at Dolywern. This is one of the few spots not known to the average tourist, but well worth a visit. As I was due back at the office the next morning, the machine was let out somewhat, and the forty-five miles to the end of our trip was covered somewhat over legal limit.

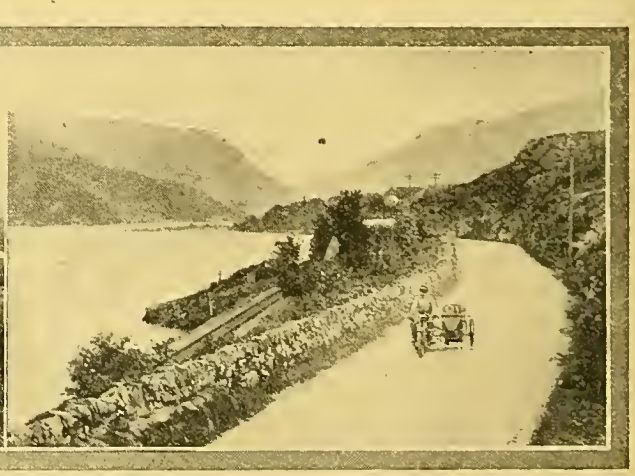
A Few Details of the Trip.

The trip covered 800 miles, during which time twelve gallons of spirit were bought, ranging in prices from 1s. 3d. to 2s. per gallon. The only troubles consisted of two punctures, a choked jet, and taking 1in. out of the belt. The immunity from belt trouble I put down to the large pulley and long drive. The engine and magneto were not touched. In conclusion, I must say that I think that my new 8 h.p. Zenith-Jap is more comfortable and at the same time safer than the lower powered mount, as one can take corners on hills more slowly and yet still be sure of being able to pick up afterwards. Curiously enough, I find no increase in the petrol consumption.

MERCURIAL.



Near the Pass of Aberglaslyn, between Portmadoc and Beddgelert.



A good stretch of road between Llanberis and Carnarvon.

MOTOR CYCLE TYRES.

Protection to every thread of fabric is as important as the fabric itself. Like a spider's web, every thread in a Tyre casing is extremely sensitive. A weakness at one point will militate against the whole. Each thread must be carefully put in relation to the others and the rubber applied so that no weakness or strain arises at any point. In fact, every millimetre must be of equal calibre so as to produce the fabric that will stand Tyre work.
This is the care used in making the fabric for the Clincher, and is the guarantee of safety to every user.

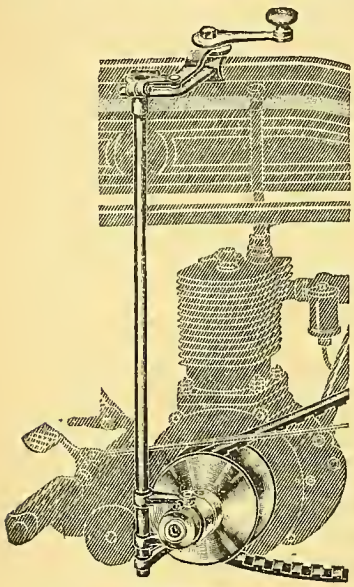
The GRADO Multi-Pulley

is just the thing, gives gear for 4-1—8-1, Lightweight 10-1.



Motor Cyclist ! Read what it will do for you.

This is no boast. It starts your machine like a car.

Takes machine and sidecar up hills impossible without.

Gets you safely through thick traffic.

Ensures safety over the greasiest roads.

In fact, it turns work into pleasure.

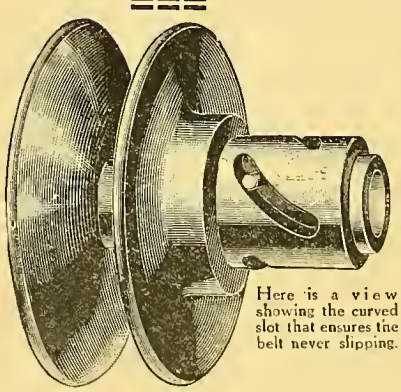
Just half a turn of the handle on the top tube changes from top gear to free engine. So Simple!

Read what a Police Constable says :

Police Station, Broughton,
Kettering, Aug. 16th, 1915.

Gentlemen,
I received the Grado Multi Pulley mid-day Saturday last. Thanks for your prompt attention to my order I fitted same and tried it same evening, and am delighted with it, it acts splendidly to every move of the control lever, and there is not the slightest slip with the belt. The fitting is quite simple. Once more thanking you,

I remain, yours faithfully,
Constable H. SWIFT.



Here is a view showing the curved slot that ensures the belt never slipping.

Fitted in two hours to Triumphs, B.S.A.,Bradbury Premier, T.D.C., Rex, Singer, Precision, and others.

Fit one to-day, you are sure to be pleased.

Prices : For Triumph, B.S.A., etc., **£3 3s.**
Lightweights, **£2 10s.**
Recessed for J.A.P., old Rex, etc., 10/- extra.

Alldays Allon REGD. Two-Stroke

THAT it should be possible to get a really reliable and up-to-date motor bicycle at this price is in itself remarkable, and there's a reason for it.

SINCE the earliest days of motor cycling we have been building motor cycles. We have done all the experimenting. That experience was based on 250 years of the best engineering experience, and the result is seen in the perfection of the Alldays Allon. By large output, economical purchases of material, and continuous employment of the most highly-skilled workmen, we can produce the Alldays Allon at the unrivalled-value figure of

£30 plus 5% for Single-speed; **£37** plus 5% for Two-speed; and **£40** plus 5% for Two-speed, hand-controlled clutch.

"THE MOTOR CYCLE" RECRUITING SECTION.

Recruiting Temporarily Closed for the Motor Machine Gun Service.

FOR a short time recruiting for the Motor Machine Gun Service has ceased. Motor cyclists have come forward splendidly for this section, and the training centre is now full up. As soon as further recruits are wanted, an announcement to this effect will be made in these columns.

The six cyclists who came from the Excelsior Training School last week were surprisingly proficient, considering their short training of only a week. The tests had been carried out on a rough common not far from the Excelsior Works, and the men were taught to ride in circles and to execute the figure 8 in and out of some football goalposts which happened to be handy. All of them, too, satisfactorily performed the brake test, and as the result of lectures and explanations by means of a sectional engine and parts, they were passed into the training batteries with a knowledge not only of driving, but of the internal mechanism of the machines. Their places were taken by six more cyclist recruits, who promise equally well.

One of the recruits, C. T. Williams, came specially from North Queensland to enlist, and though an experienced car driver, preferred the motor cycle section at 1s. 2½d. per day.

One or two motor cyclists who have served in volunteer battalions were accepted last week.

Any motor cycle agent willing to exhibit a special poster as soon as recruiting is re-opened may have a copy or copies on application to the Editor.

With further reference to the paragraph in our last issue respecting transfers, under War Office letter transfers from the Territorial armies are now forbidden. It will be known that transfers from the new armies have been prohibited for some time past. We have received further applications for transfers since our last issue went to press, and should any applicants not have received replies, they will gather the reason from the foregoing.

Of the sixty-odd recruits who attended last week's inspection the shortest was 5ft. 1in. and the tallest 6ft. 4in.

Latest recruits in the Motor Machine Gun Service are given hereunder :

Atkinson, F.	Fryer, R.	Pattison, J. B.

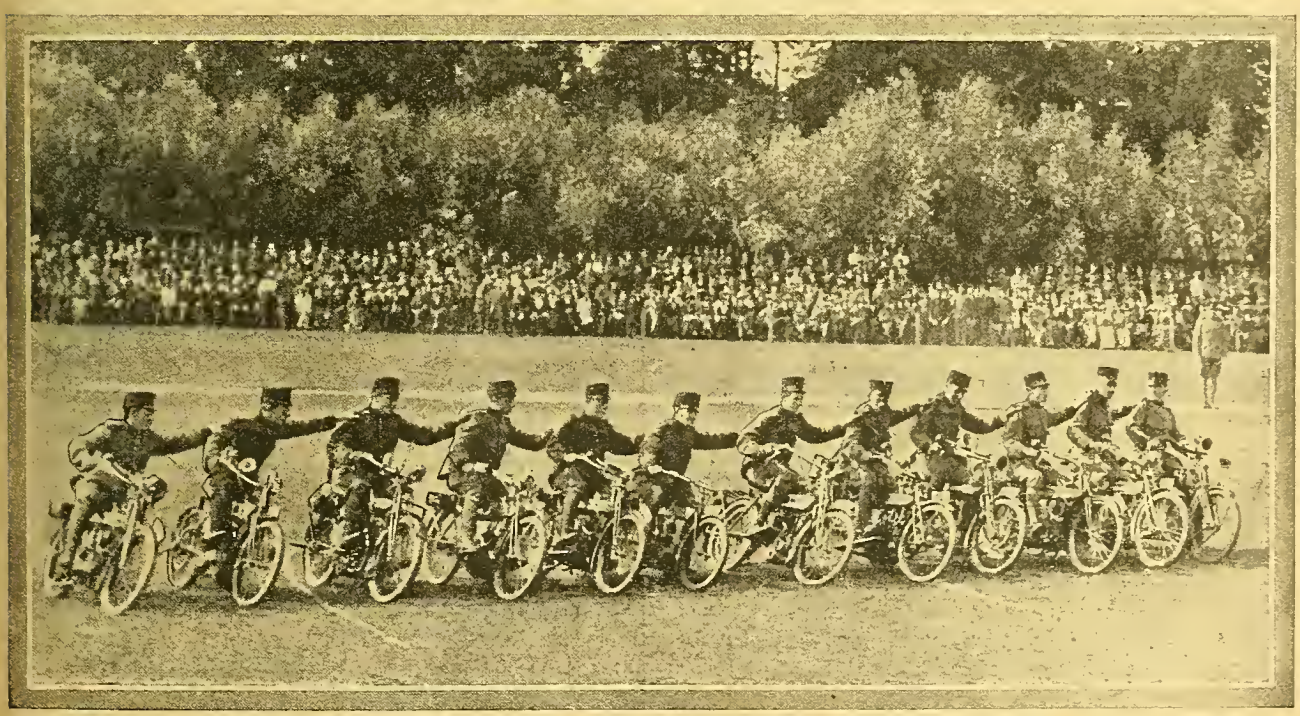
R.E. Despatch Riders.

Despatch riders are still wanted for the waiting list of the South Midland Divisional Area. Only experienced riders can be passed, and, before their names can be added to the list, a demonstration in riding abilities is necessary. All motor cyclists residing in Warwickshire, Worcestershire, Gloucestershire, Buckinghamshire, and Berkshire who wish to enlist as despatch riders in the Royal Engineers should apply for an appointment to the nearest inspecting officer for the area, viz., Lieut. H. Smith, 6, Brynland Avenue, Bishopston, Bristol; Mr. Geoffrey Smith, 19, Hertford Street, Coventry; or Mr. R. C. Davis, 11, Hythe Bridge Street, Oxford.



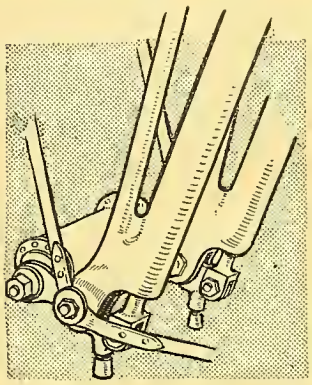
A DOZEN DUTCH MOTOR CYCLISTS GIVING AN EXHIBITION RIDE IN A CIRCLE.

Dutch military motor cyclists demonstrating their prowess before H.M. Queen Wilhelmina at the Hague. Many well-known British makes will be recognised.

THE 8 h.p. TWIN-CYLINDER THOR.

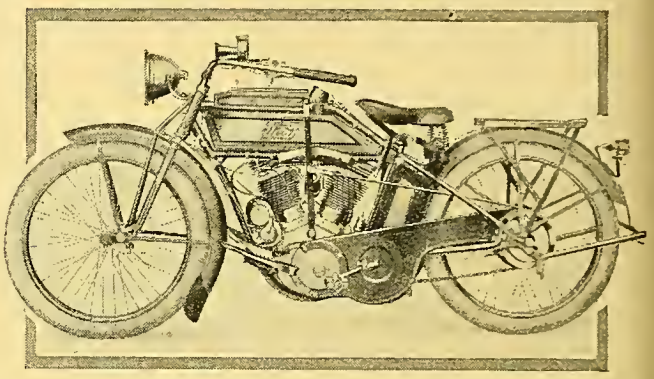
The Latest American Machine to be placed on the British Market.

THE 1916 8 h.p. twin-cylinder Thor, which hails from Chicago, follows generally American practice. It has a pleasing appearance, being enamelled in two shades of blue, with panelling around tank and toolbox. Its mechanical features are interesting. The cylinders, which are of 82.5 mm. by 92 mm. bore and stroke, are placed at an angle of 50°, and have entirely enclosed overhead inlet valves. This contributes much to the neatness of the machine, at the same time making for quiet running. The machine is fitted with a Schebler carburetter. A typically American feature is the combined Splitdorf magneto and dynamo, mounted on an extension of the crank case between the down front tube and cylinders. The accumulators are carried below the saddle-pillar. Twist handle-bar control is adopted, the left-hand operating the spark and the right-hand the throttle. The exhaust lifter is controlled by a lever on the right-hand side, operating by means of Bowden wire. Chain drive is employed, and the transmission is direct from the motor sprocket (which is under-geared and driven at a reduced speed, being mounted eccentrically to the engine-shaft) to combined clutch and two-speed hub gear.



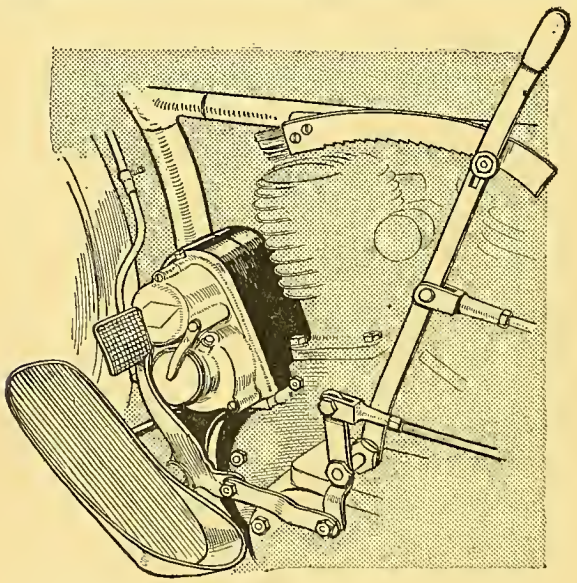
The cantilever front wheel suspension.

The springing consists of spring forks on the rigid truss principle, the springs being housed in the fork tubes and a spring saddle pillar. The toolbox is on the top tube over the tank, where also the speedometer (driven from the back wheel) is fixed. The main tank will hold two and a half gallons of petrol, and an oil tank holding three quarts is situated below the saddle.



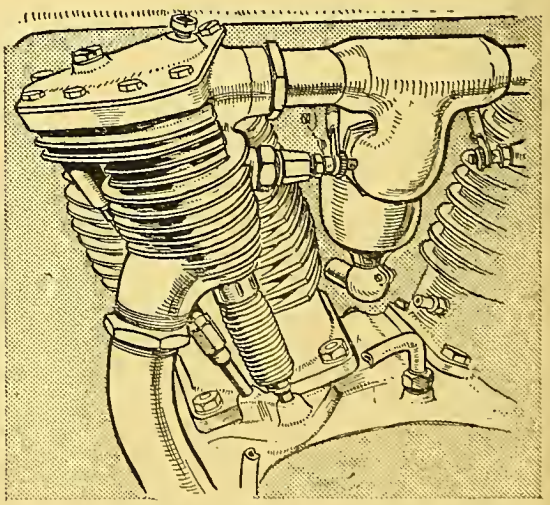
The latest American arrival—the 8 h.p. twin-cylinder Thor.

The London and Home Counties agency is held by Watkins and Harding, Ltd., Portman Garage, 172-4, Upper Richmond Road, East Sheen, S.W.

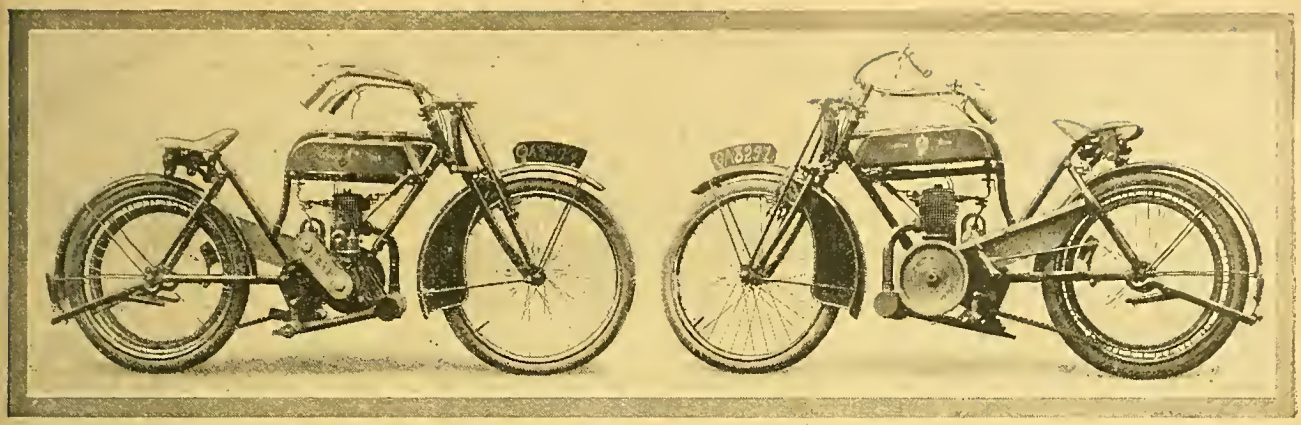


Position of combined magneto and dynamo, foot and hand-operated speed lever, and footrest on the American Thor machine.

On the Paddington Recreation Ground on Saturday, Harry Martin beat the track records for one mile and five miles (flying start). He covered the first distance in 1m. 17⅗s., thereby reducing the previous best track figures by 3⅕s. The five miles were covered in 6m. 46s., which beat record by 10⅗s. The meeting was mainly for push cycles, and was organised with the object of providing a fund for comforts for men of the 3rd City of London Royal Fusiliers.



8 h.p. twin-cylinder Thor engine, showing enclosed overhead valves, position of sparking plugs and "T" shaped induction pipe. The cylinder dimensions are 82·5 mm. × 92 mm., giving a cubical capacity of 976 c.c.



Ladies' model of the two-stroke Despatch Rider, particulars of which appear on this page.

NEAT CARBIDE CARRIER.

The Chemico carbide carrier is a neat fitment for the motor cycle made by the County Chemical Co., of Birmingham. It will be seen from the sketch that the carbide is carried in a leather case attached to the back down tube of the machine by a couple of straps. In this position the case is both accessible and not in the way. It is constructed to carry a ½ lb. tin of caroide, and the price complete is 2s. 2d.

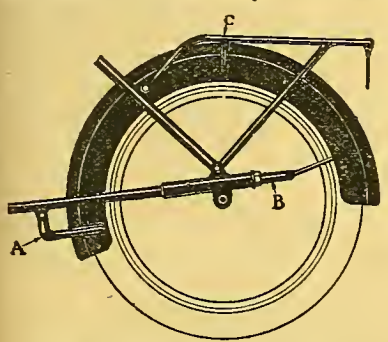
Chemico carbide carrier for attaching to seat tube of a motor cycle.

A SLIDING MUDGUARD.

AS is well-known, the back wheel of a Zenith is capable of moving backwards and forwards to maintain correct belt tension when the Gradua gear is operated; consequently, if the mudguard is attached to the frame of the machine the distance between it and the wheel will constantly vary. The illustration given herewith shows a mudguard which is designed to overcome this, and is the patent of Mr. R. E. Dicker.

Referring to the sketch, it will be seen that fixed to the chain stays is a fork A, in which steel plates on the sides of the valances slide, while the operating stays B, working with the sliding bushes in the chain stays pull and push the guard; a joint is made in the mudguard stays to eliminate the tendency to bend. At point C the guard swivels on a hardened bolt attached to one of the carrier tubes. A road test of the device shows that there is no rattle, the slides do not stick, and mud does not affect its working.

Another advantage is that by simply removing three nuts the mudguard may be detached from the machine.

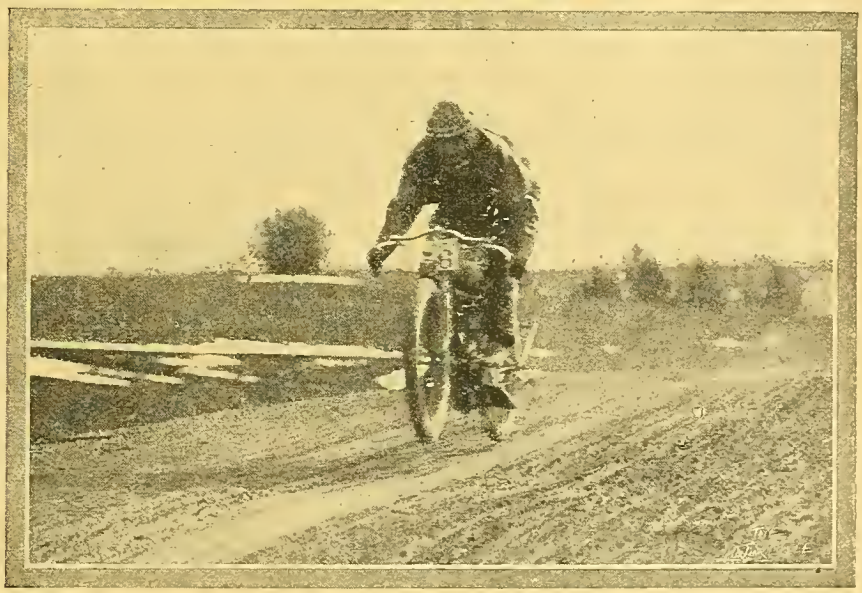


The sliding mudguard for fitting to Zenith machines. (See paragraph above.)

THE DESPATCH RIDER LIGHTWEIGHT.

A HANDY little machine is that made by Messrs. Dreng and Co., of Erdington, Birmingham, and known as the "Despatch Rider." It is made in both men's and ladies' models, the specification being the same for both, except that the latter has the top tube dropped to allow for the rider's skirt; it also has a belt guard fitted. The engine is a 2¼ h.p. two-stroke of only 211 c.c. Druid, Saxon, or Brampton forks are fitted, and either 26in. or 24in. wheels. The riding position is exceptionally low, being only 28in. from the ground. No change speed gear is fitted, the idea being to keep the machine as simple and light as possible. As will be seen from the illustrations, it has a neat appearance, while the khaki enamel gives a smart finish.

During a short trial run on the Despatch Rider we were struck by its handiness, ease of starting, and absence of vibration. The little engine also had a good turn of speed. It is a suitable mount for those requiring a light and simple machine.



W. Ousley (Indian), travelling at full speed in an Australian road race last June. It is a remarkable photograph, as not only are both wheels off the ground, but the rider's feet are several inches above the footboards. It may be a surprise to some people to see snow, but every kind of climate imaginable can be found in Australia, from the semi-tropical regions of the North to the snow-capped mountains of New South Wales, and in both Victoria and N.S.W. snow is not unknown, even on ordinary altitudes, in the winter months.

A.A. and M.U. Notes.

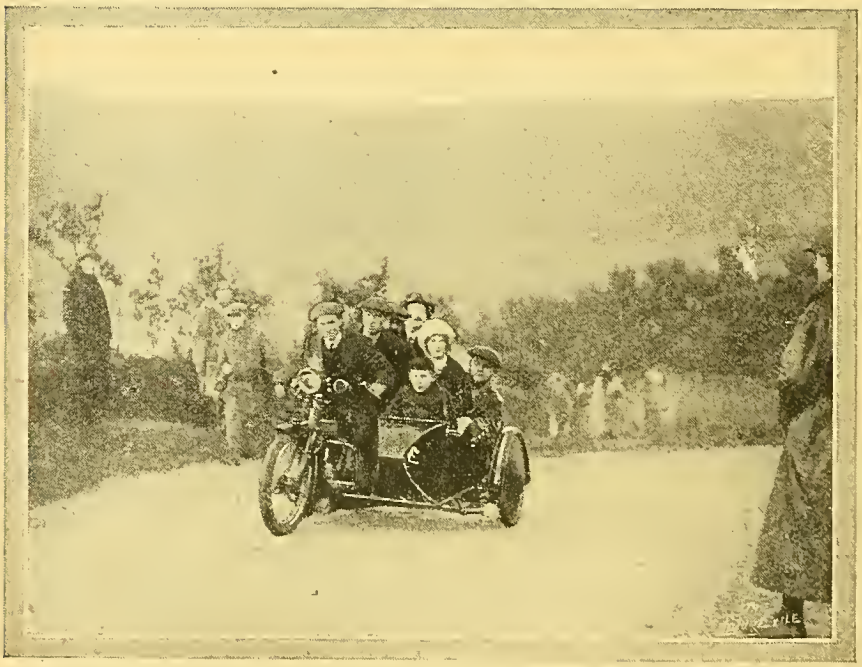
SPECIAL NOTICE TO A.A. MOTOR CYCLISTS.—Motor cycling members of the A.A. are notified that from now onwards they will not be entitled to receive roadside and other assistance from the road patrols if their machines do not carry the *red* token in the centre of the A.A. badge, denoting payment of subscription for the current year. Members who have changed their addresses since last year, and who may not therefore have received the usual annual intimation that their subscriptions have become due, and have in this way not obtained the necessary token, should communicate with the secretary without further delay.

Lord Kitchener Inspects Sidecar Machine Guns.

Whilst in France last week Lord Kitchener on two separate days inspected a complete battery of the Motor Machine Gun Service.

Officer Motor Cyclists.

Reckless riding on the part of a section of soldier motor cyclists, apparently on leave, we regret to notice, continues, and, as a result, accidents are being continually recorded in the local papers. At the week-end we had two experiences which bear out the utter carelessness of some military motor cyclists. Whilst approaching a dangerous cross road very cautiously, two officers on a sidecar suddenly shot across without warning. Had we been travelling at an equal pace, a bad collision would have been the result. In the second instance a soldier motor cyclist swung round a blind corner at such a pace that the footrests of his machine almost touched the ground.



A GOOD CLIMB. G. W. Wilkin, of Sheffield, driving a Norton "Big 4" sidecar outfit, with a total load of seven passengers (75 stone), up Sir William Hill at Grindleford. The hill will be remembered as having proved a stiff proposition to many competitors in the A.C.U. Spring Trial last year

SPECIAL FEATURES.

ELECTRIC LIGHT FROM A MAGNETO.

NEW MODELS (Illustrated).

THROUGH THE LENGTH AND BREADTH OF WALES.

Recruiting for M.M.G.S. Closed.

Recruiting for the Motor Machine Gun Service has temporarily ceased. The response of late has been excellent, and it is now a question of finding more accommodation.

Average Second-hand Prices.

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*. We quote those models of which at least five weekly averages have appeared during the past two months. Where it is possible to obtain a sufficient number of each model we also give the average for the past week:

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.
A.J.S.	1914	6 3-sp. sidecar	£77	£72
,,	1913	6 3-sp. sidecar	—	£53
,,	1914	2¾ 3-speed	—	£43

Motor Cyclist Officer Married.

We offer our congratulations to Lieut. S. W. Carty, A.S.C., late of Liverpool and Newcastle, and a leader in Northern motor cycling circles, on his marriage to Miss Maude Eleanor Hedley.

Army v. Navy Motor Cyclists' Hill-climb.

Following upon the successful Army and Navy race meeting at Brooklands, brought about by *The Motor Cycle*, the suggestion has been made to hold a hill-climb at Kop Hill, Princes Risborough, between representatives of the Army and Navy.

The National War Funds.

On Tuesday morning last the principal war funds stood as follow:

	£	s.	d.
The Queen's Work for Women Fund	163,868	0	0
Belgian Relief Fund ...	767,000	0	0
"France's Day" Collection	21,000	0	0
Serbian Red Cross Fund ...	20,073	13	11

Uncontrolled Dogs.

At the inquest on a motor cyclist, who was killed by being thrown off his machine by a dog, held recently at Pickering, the coroner (Dr. Francis Porter) commented strongly on the danger of allowing dogs to run without control on the village streets. The animals ran out at motor cycles and cars, as well as push cycles, to the great danger of riders. The foreman of the jury (Mr. Trowsdale) demurred—although it was established that the deceased was a very steady rider—on the ground that, generally speaking, "motorists were addicted to rushing through the streets at such a speed that the public had to exercise care in dodging them to prevent being run over." How a presumably sensible man can reason in such a manner passes our comprehension.

Dutch Contest for the Eysink Cup.

On Sunday, August 15th, the Nederlandsche Motorwielryders Vereeniging organised a competition for the Eysink Cup, presented by Mr. A. Eysink, of Amersfoort. At 5 a.m. twenty-eight riders were started from Utrecht, the object being to cover 375 km. with an average speed of 35 km. per hour. The road to be followed was: First round—Utrecht, de Bilt, Amersfoort, Nykerk, Putten, Garderen, Uddelermeer, Aardhuis, Apeldoorn, Uchelen, Hoenderloo, Otterloo, Ede, Woudenberg, Amersfoort (134.1 km.); second round—Amersfoort, Nykerk, Putten, and same route as in the first round to Amersfoort again (113.2 km.); third round—Amersfoort, Putten, same route till Woudenberg, and by Zeist and de Bilt to Utrecht (128 km.). The weather being fine, the ride proved to be a success. Lunch was served at Apeldoorn, and the riders who arrived at Utrecht by 7 p.m. (twenty-six out of the twenty-eight) celebrated their success at a pleasant dinner, assisted by many friends. The prize-winners are: Extra, P. H. L. Maas (4-cyl. F.N., type 700); 1, W. van Kol (Vulkaan); 2, B. J. ten Dam (Excelsior); 3, Jac. Fonck (Dayton); 4, E. J. Veerman (Indian). Extra prizes were obtained by: 1, H. G. Dolk (Excelsior); 2, Ch. E. v. d. Bossche (Douglas); 3, P. A. Bos P.A.zn (Harley-Davidson); 4, C. Witteveen (James).

Lieut. F. A. McNab.

The many friends of F. A. McNab will be pleased to hear that he has obtained a commission in the Royal Naval Reserve, and hopes to compete at Brooklands in the United Services Meeting on September 4th.

Swivelling Head Lights.

A motor cyclist was recently stopped on the London-Birmingham road, near Woburn, by four policemen, who proceeded to remove his head light, which he was not using at the time, at the same time threatening him with a summons. The head light was of a type recently declared to be perfectly legal by a magistrate. It seems to us that the police acted in a very high-handed manner, and exceeded their duty.

Americans and British Trade.

The Thor motor cycle is the latest American arrival, and all the time the motor cycle press across the Atlantic is urging Yankee manufacturers to seize the opportunity for business while the British manufacturers are unable to supply. They quote the following figures in support: British imports from United States during the first six months of 1915 equalled $620,000,000, compared with $350,000,000 in the corresponding period of 1914, and $345,000,000 in 1913.

Motor Cycles in Botha's Campaign.

Motor cycles, in conjunction with armoured cars, played no small part in the operations under General Botha in what was formerly German South-West Africa. Twelve armoured Rolls-Royces with supply, ambulance, wireless, and repair cars were used in conjunction with twenty-eight Douglases, the whole contingent being perfectly self-contained with its own stores and petrol. An interesting feature is that of the original number of motor cycles twenty-five came through the campaign successfully, and were then shipped together with the cars from Cape Town. This is a very high percentage, especially when it is considered that the riders had work to perform of a most trying nature. The whole fleet was under the command of Commander Whittall, well-known in England as a keen motorist and writer

Roads to Avoid.

The Great North Road near Newcastle is in very bad condition, and the last eight miles into Edinburgh is bumpy.

There are many pot-holes between Alton and Bishop's Waltham, but a single-track machine can miss most of them; some of the worst holes have been repaired.

The main road from Bushey Heath to Watford is in a deplorable condition for about three miles. This can be avoided by turning to the right at the top of Clay Hill, and then taking the lane to the left.

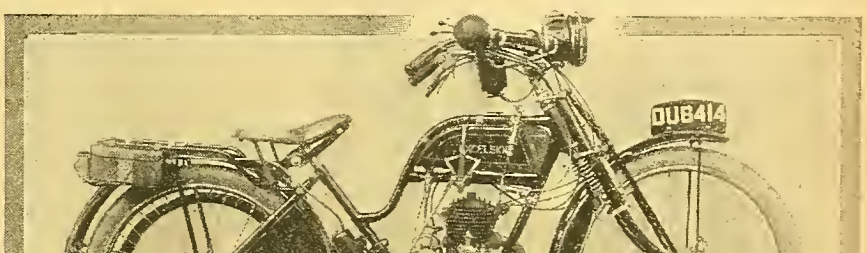
The London County Council

LOCAL TAXATION LICENCES AND REGISTRATION OF MOTOR CARS.—The growth of the work of the London County Council in connection with local taxation licences and registration of motor cars, particularly as regards applications under the Motor Car Act, has necessitated improved arrangements for the convenience of the public. New accommodation has therefore been provided at 19, Charing Cross Road, and on and after August 30th, 1915, all business of the above nature will be transacted at that address instead of at the County Hall, Spring Gardens, S.W., and 40, Craven Street, W.C., as hitherto.

Australian Grand Prix Races.

Reports are to hand from Australia of one hundred-mile races, held in New South Wales and Victoria respectively. The former provided twenty-eight starters, and the race was won by J. E. Mellor (6 h.p. Matchless), who, with a 12m. start, covered the 100 miles in 2h. 3m. 2s. H. Bartleet (6 h.p. Zenith) and W. J. Ousley (7 h.p. Indian) were second and third respectively, the latter making fastest time. A picture of Ousley at full speed appears on page 209 of this issue. Both he and Mellor, the winner, used Dunlop tyres.

The Victorian 100 miles race was run over a triangular course of thirty-three miles, three circuits having to be made. The winner was R. Finlay (7 h.p. American Excelsior), who had 13m. start over the scratch man. Second and third places were taken by E. Mayman (3½ h.p. J.A.P.) and E. Tyler (3½ h.p. Triumph). Finlay also made fastest time.



The 2¾ h.p. two-stroke ladies' model Excelsior. An Albion two-speed gear is fitted, in conjunction with chain and belt drive. Altogether a very suitable mount for a lady, and one which, if required, can take a sidecar.

Leaving St. Albans be I was soon well on the to cover up all traces through towns which ga tion, and a broken d innocent of any of the camera, but then I cc trouble. The owner o positively panic-stricken know what I was doing, it took," and commande No doubt the stories of nerves, so that he was l

Very different from owner of a riverside bar fully consented to be photographed, and invited us to see the cosy interior of his home on the water. A most interesting character this, a man who, at the age of seventy years, having spent fifty-nine of them on the sea, found it impossible to live on dry land, so became the owner of this vessel, on which he has spent the last five years, winter and summer, only leaving his moorings occasionally to take a party on a ten days' trip into the North Sea. He evinced great interest in a machine controlled by "two girls," as he put it, questioning about the speed attainable and use of the levers. The kick starter was the part which called forth a good many questions. In spite of our avowals, I doubt if we convinced him of its merits, as when we made ready to restart he offered a "shove off." We were able to refuse the kindly help, knowing that with our engine still warm we could start up with little exertion. A few miles farther on I had a unique opportunity of photographing a barge laden with wheat, just running home alongside the Stambridge Flour Mills.

An Interesting Church.

One generally meets with perfect courtesy from owners of buildings one wishes to inspect, and the rector of the historical church of Ashingdon was no exception to the rule. He made us acquainted with the ancient building, the tower of which was built nine hundred years ago, when

in 1020 King Canute (Knut) and the Archbishop went to consecrate the church built on the spot where four years previously he had fought his battle against Edmund Ironsides, and—as the Anglo-Saxon chronicle hath it—"where all the English noblemen lay dead." Containing perfect specimens of windows of different centuries and other rare architectural beauties, this church on the hill is well worth a few miles run from the beaten track of motor cyclists.

Two Slight Troubles Soon Cured.

Our first taste of trouble was a broken clutch wire, so, passing through a village which boasted no garage, we halted outside a tiny blacksmith's shop. The smith pretended no knowledge of things motorish, so we carefully threaded the strands of wire through the hand control, and then called on him to bring his soldering iron to finish the job. Judge of our surprise when he requested that we turned the machine upside down so that he could get at it! However, he finished the work, although not particularly neatly, but after all neatness is not essential. A puncture in the sidecar tyre was our only other cause of delay, and, my passenger taking her share of the work, we soon effected a repair by the road-side. With a few good levers and a repair outfit no rider of a few months' experience should need assistance with a simple puncture.

MAY WALKER.

takes us direct to the river.

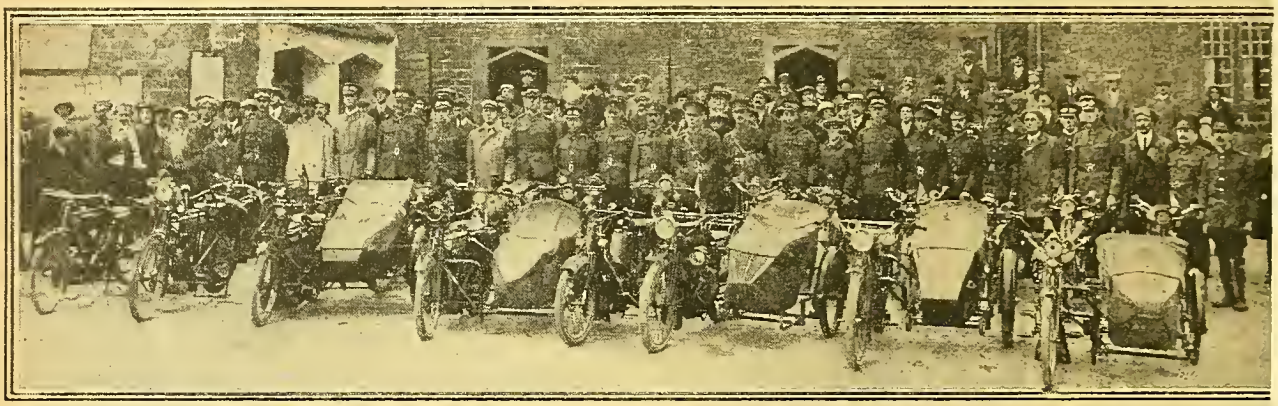
A RECRUITING RALLY ON THE DERBYSHIRE MOORS.

OWLER BAR, a hamlet eight miles from Sheffield, on the fringe of the Derbyshire moors, witnessed a remarkable scene on Sunday last, when a great gathering of between seven hundred and eight hundred people assembled for a recruiting meeting. The object was to obtain recruits for both Regulars and the Sheffield Volunteer Training Corps, and we understand that this was successfully achieved. As Owler Bar is altogether inaccessible by rail, it followed that everyone present found his way by road, and consequently the number and variety motor vehicles present were very lar They ranged from big chars-à-bancs lightweight motor cycles. In the aft noon the Sheffield Volunteers, v have a motor cycle section, carried some instructive manœuvres.



MOTOR CYCLE SECTION OF THE SHEFFIELD VOLUNTEER TRAINING CORPS.

The photograph was taken on Sunday at Owler Bar, on the Derbyshire moors. A recruiting meeting for both Regulars and Volunteers was held, the entire concourse, estimated at between 700 and 800 people, being transported by motor vehicles.

THE UNITED SERVICES MOTOR CYCLE RACE MEETING.

AS announced in the last issue of *The Motor Cycle*, in view of the great success of the All-khaki race meeting, a further event of the same type will be run off at Brooklands on the afternoon of Saturday, September 4th, beginning at 2 p.m. It will bear the title of the "United Services" Motor Cycle Race Meeting, and will be open to any member of the British Navy, Army, or Allied Forces in uniform.

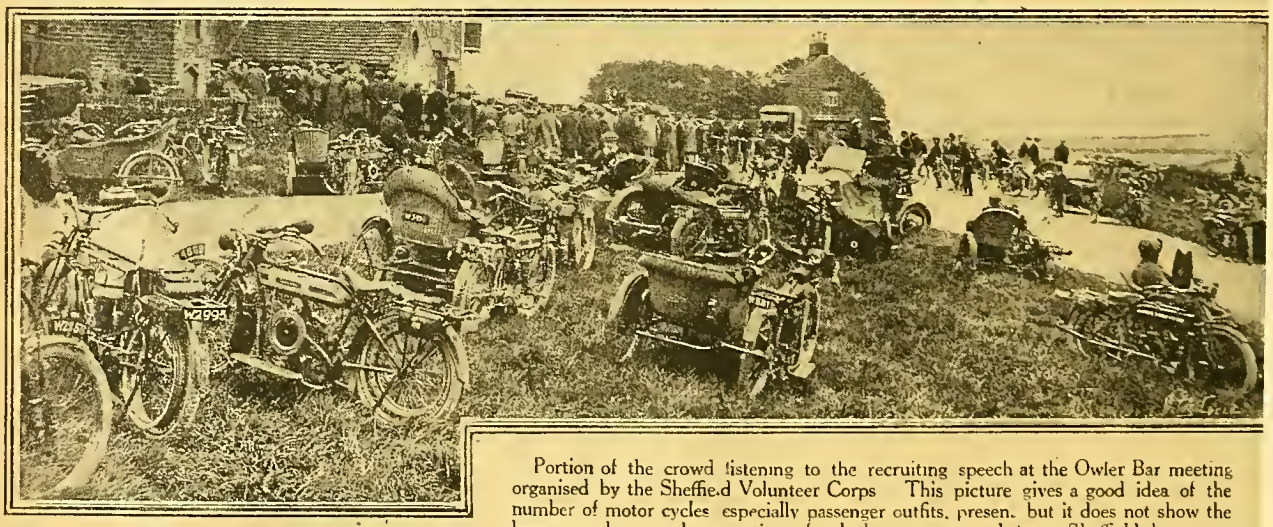
At the present time the Brooklands staff are making special efforts to get the finishing straight in good condition, and the fact of the finishing straight being available will greatly add to the success of the event. The following officers have consented to officiate as stewards: Col. H. C. Holden, Assistant Director of Mechanical Transport; Major D. F. Nicholl, D.S.O., D.A.A., Q.M.G.; and Dr. A. M. Low, Second Lieutenant R.F.C.

There is no reason why the "United Services" meeting should not be every whit as successful as its predecessor, provided the weather is fine. The programme (published on page 190 of our last issue) is a good one. The chief differences from the previous event are the introduction of the lightweight half-mile sprint for all makes of motor cycles with engines not exceeding 350 c.c.; the serpentine fast race, which will take the place of the successful slow race in the last meeting, and, finally, the separation of the sidecar and light car races.

Entries, which close at noon on Sat day, August 28th, should be forwar at once to the secretary of B.M.C.R.C., Mr. T. W. Loughborou c/o the Auto Cycle Union, 89, Pall M London, S.W.

At the time of going to press ent had been received from the following:

C. P. Marcell, Assistant-paymast R.N.R.
J. C. Branwell, Pte., Bradfield O.T.
R. A. Wallace, Pte., Oundle O.T.C.
S. H. G. Stockbell, Second Lieuten 3/1st Cambridgeshire Regiment.
H. Saunders, A.M., R.F.C.
F. H. McNab, Lieut. R.N.R.
C. G. Cardew, Lieut. R.E.
C. L. Scott, Second Lieutenant A.S.



Portion of the crowd listening to the recruiting speech at the Owler Bar meeting organised by the Sheffield Volunteer Corps. This picture gives a good idea of the number of motor cycles especially passenger outfits, presen. but it does not show the huge crowd, a good proportion of which was conveyed from Sheffield by motor chars-a-bancs.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

Rear Springing.

Sir,—About a year since we were preparing to market a spring frame, the patented design of our Mr. H. S. Bilbe, who is now serving in the Motor Machine Gun Service. The design, which you have described and illustrated in *The Motor Cycle*, is a thoroughly sound and practical one, and has been fully tried out. The design admits of many variations to suit every type of motor cycle.

THE ENDRICK ENGINEERING CO.

The Holne Chase Corner.

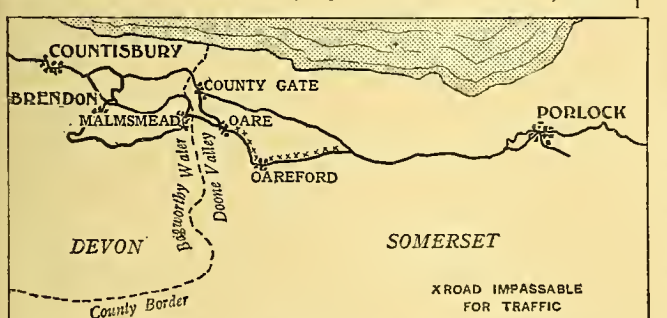
Sir,—When down in the West of England recently I found a new road being cut through Holne Chase, which will avoid the hairpin bend, so well known, and at one time so much dreaded by competition riders. The new road is quite an easy gradient throughout, and starts at Holne Bridge, partly traversing a private road that used to lead up to the Chase. It comes out at an easy angle into the old road about three-quarters of a mile from the hairpin. By the time the next Land's End run takes place the hairpin bend will be closed, and competition riders will know of it no more. Only a short time back a lady descending the hill in a car failed to negotiate the bend, and dashed into the wall, demolishing several feet of it. This apparently decided the authorities to construct the new road.

F. W. CHAPMAN.

Exmoor Roads.

Sir,—The first road down to Oare through Oareford is rough, with two unrideable hairpins with bad surface. The second road down to Oare by County Gate has a good surface and well engineered gradient. The road at the bottom through the fir wood requires caution; it is generally sticky over the narrow bridge. In Oare turn to the right, and so in a mile of high banked lane "EL 1969" will come to the little farms at Malmsmead. (See that you do not charge the stone bridge as you come in.)

Leave your mount in charge of "Old John," and strike up the Doone Valley immediately up the lane to the left, and



keep to the left. If not keen on footing it, you can hire ponies from the aforementioned ancient. On the return—though you will not want to return—the hill up to County Gate, by which you came down, will present no difficulties. A single-geared Triumph at 5¼ to 1 will take it without anxiety.

The first road by Oareford, with the tricky work at the hairpins, is delightful, but "EL 1969" would be well advised to tackle it on foot. Even with a big reserve of power, and special tyres for the loose surface, the anxieties of progress rob one of the proper appreciation of the scenery. It is advisable to take plenty of spare petrol, as it is not obtainable in these valleys.

In closing, I would remind your passenger that toby-jugs bought hereabout are not necessarily such good investment as War Loan.

W. R. BROCKWELL.

Two-stroke Petrol Consumption.

Sir,—Thanks to your interesting and delightful paper, I became a motor cyclist gradually, by two stepping-stones consisting of two different types of auxiliary. The last one, a £12 12s. J.E.S. of 1 h.p., mentioned recently by "Ixion" as a *rara avis*, proved remarkably efficient, even for long-distance touring, for I thrice rode from Scotland to England and back, once over the Grampians from Inverness to Perth, and once from Brechin (forty miles from Aberdeen) to Cardiff in S. Wales in four days, this latter run necessitating three successive day's runs of 150, 135, and 140 miles—not bad for 1 h.p. on an ordinary cycle. The valves and bearings have not been renewed, and do not require it, in spite of constant riding.

Recently I got a well-known two-stroke. Frequently I have noticed paragraphs in your paper showing various experiments and improvements made to get petrol consumption more satisfactory in two-strokes. But why is this left to the customer? Why don't makers do the experimenting? A letter from Mr. S. Wells some time back demonstrated this very pointedly. He tried three carburetters before he got satisfactory results with an Everest, and other riders have had to do similarly. It seems pretty hard that the customer should have to go to all the expense and trouble before getting good results, when the makers know that a better petrol consumption is possible, but do not take the trouble to fit machines with carburetters that do give satisfactory results. I have no doubt been spoiled by the consumption of my J.E.S., which on one occasion gave me 108 miles to slightly over half a gallon!

M.M.G.

Sidecars for Use with Spring Frames.

Sir,—In your description of the Bramble sidecar in the issue of August 19th there are one or two general remarks which I think ought not to pass unnoticed.

You say, "In the sidecars that have been used with spring frames up to the present, although they have allowed for the springing of the bicycle frame, the benefits have been considerably minimised by the fact that the sidecar chassis has been rigid, thus imparting road shocks."

In reply to this, I should like to point out that for the last six years I have produced a spring frame Montgomery sidecar which has steadily grown in popular favour until it is now one of our leading products, and the difficulty is to keep pace with the demand.

The semi-elliptical spring shown in the skeleton view of the Bramble sidecar is exactly similar to those used on the Montgomery sidecar six years ago, and only differing in essential detail from those used to-day.

I quite agree with your remarks *re* luxury of the usual Cee springs, and in my production referred to these Cee springs are used for the body springing, and the semi-elliptical type for the frame springing, and this arrangement gives very satisfactory results.

W. MONTGOMERY.

An Appreciation.

Sir,—I must apologise for the negligence on my part in not writing to thank you for the way in which you have sent me each week, without fail, the current copy of *The Motor Cycle*. You can hardly imagine how this journal is appreciated by all of us here.

I was glad to see the "All-khaki" meeting was a success, and good luck to *The Motor Cycle* for arranging such an interesting day's sport for those lucky enough to be able to participate in the events. E. HOOPER, Corpl. R.E.,
Despatch Rider, General Headquarters.

A Tour in Wales.

Sir,—I have often heard the question raised, Can a 3½ h.p. machine tour North Wales? So for the benefit of readers who, like myself, cannot afford more power, I will give an outline of my experience.

I have just completed a tour on my 3½ h.p. two-speed Triumph, with wife and two children, through some of the finest scenery in Wales. On one hill only did I have to shed my passengers. This was the well-known Sunrising Hill, just out of Stratford-on-Avon, on my homeward journey. The route, kindly supplied by you, took us through Chingford, Watford, Aylesbury, Banbury, Stratford-on-Avon, arriving at Kidderminster at tea-time. After tea we made our way to Bridgnorth, where we put up for the night. Next day we went on through the pretty town of Shrewsbury to Chirk.

After having struck the borders of Wales we began to notice the scenery getting finer and the language different. When we got to Llangollen the country appeared simply lovely, with its winding roads, and mountains covered with heather, etc., with sheep dotted over them. We soon reached Bala with its lovely natural lake, and then after several miles of down hill we came upon the town of Dolgelly nestling, as it were, at the foot of Cader Idris. Barmouth seemed pretty full of visitors as we passed through, stopping to get several good views. We reached the ancient town of Harlech just in time to put up for a thunderstorm, which did not last long, so we had a good look at its castle, built on a high rock, facing the sea, and historic in the Wars of the Roses. The views from the castle are unsurpassed.

We made Penrhyndeudraeth our headquarters for three days, during which we visited such places as Criccieth, Festiniog with its slate quarries, Shell Island with its lovely shells, and many other interesting places.

We altered the route for the homeward journey, taking a run round the north coast. After a long climb through winding roads, we came to the Aberglaslyn Pass, the grandeur and beauty of which were well worth seeing. We then passed through Carnarvon, getting a fine view of Anglesey and the Menai Straits, Bangor, Abergele, and Conway, with its castle and Suspension Bridge, similar to the Menai Bridge. When we got to Flint we struck inland and came to Wrexham, Whitchurch, and Wellington. The rest of the journey was by the same route as the outward one. Generally speaking, the Welsh roads were not at all bad. In all we completed about 700 miles, with no belt, tyre, or mechanical trouble. This machine has 30,000 miles to its credit. F 6219.

Motor Cycle Volunteers

Sir,—The carping critic would again crave some space in your columns to thank "A.G.M." (Capt. A.S.C.) and Ptes. Parker, Buck, and Drinkall for their support.

"Discouraging Patriotism" is the title of an article in a contemporary of yours. This article is a criticism of my previous letter to you.

Firstly, I can assure the writer, had he been waiting any time at the foot of Style Kop on the afternoon of Saturday, July 17th, he would have seen these young men "playing themselves" to the annoyance of spectators and competitors alike.

Secondly, "these attacks hardly deserve notice." I quote from the article in question. Of course, the writer knows best the value of his article, since he utilises a whole column of his paper for it.

Thirdly, no person criticised the United Arts Volunteer Rifles, Old Boys, or any similar officers' training corps organisations—organisations which are in a different street from the bulk of these motor cyclist volunteer bodies.

Lastly, amongst those seen at the hill-climb were many employed on Government work. Doubtless that is why the small coterie near the finishing line on Style Kop persisted in playing with a toy pistol. They must have been from some munition factory and had annexed some T.N.T. to advertise their interest in high explosives.

A good load for a Triumph and sidecar. See letter from F 6219 on this page. The photograph was taken at Penrhyndeudraeth during a Welsh tour.

I reiterate my opinion that these motor cycle volunteer corps are being used as a means of back-door enlistment by large numbers of fit men eligible for service.
M.B., Lieut. R.A.M.C.

Sir,—I have read the letters from Captain A.G.M. and three privates stationed at Burma, published in your issue of the 19th inst., and I feel that I must take exception to what I think is an unjustifiable criticism of a corps of men who are trying to do their bit for their country. The main objection your correspondents raise is that men of military age are wasting their time in Motor Cycle Volunteer Corps when they ought to be entering into the spirit of the sterner game. Speaking for my own corps, I may say that without exception the members are either above the military age or men with big responsibilities who, at the present time at any rate, cannot see their way to enlist, however much they might desire to do so, while one or two have been already rejected as medically unfit. Now, seeing that all members of military age have signed the form agreeing to enlist if specially called upon to do so, or in the event of a foreign invasion of these shores, I fail to see why they should be libelled for failing to do their duty. Can Captain A.G.M. deny that a large number of men who originally enlisted in Motor Cycle Volunteer Corps have since joined the Regular Army? Can he honestly say that those who are unable to do so are wasting their time in preparing themselves for military duties by learning, under competent instructors, signalling (Morse and semaphore), shooting, skirmishing tactics, despatch riding, etc.? If he thinks that a strenuous week-end comprised of the above

Speed, Yes!—
and Power, Too!!

4—60 miles per hour on top gear and tractable all the way. That is characteristic of The Silent Grey Fellow

But this All-Purpose Motorcycle stands rather on its Reputation for Reliability on the Road —that kind of reliability which makes a run to Land's End, John-o'-Groat's, North Wales, or the Lake District a spin of perfect pleasure

Proof against the severest tests imposed on road or track, this reliability has won testimonial after testimonial from thoroughly satisfied riders (many of whom are holding Commissions in His Majesty's Forces)

In fact, you will find the more you ride this machine the more fully you will appreciate the Comfort, Silence, and Dignified Appearance of the Up-to-date

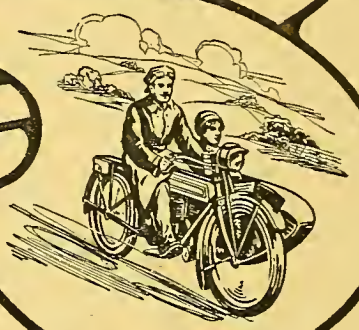
QUADRANT



The success
of your Summer
Tour depends more on
the service of which your mount
is capable than on the weather or your selection of a route.

Confidence in your "steed" — that is a first essential — it will make for perfect enjoyment when all things else are favourable, but—

It will do more than that for, when difficulties of road and weather must be faced, it will make such difficulties seem less—far less—obtrusive.

And such a confidence the "queryless Quadrant" never fails to stimulate, for it is "indeed a trusty steed," and capable of overcoming every task you put it to!

One model of particular interest is the **4½ h.p. Sidecar Combination with B.S.A. Countershaft 3-speed gear .. price £66 11s. 0d.**

Let us tell you more about it — and the others.

QUADRANT WORKS, Lawley Street, Birmingham. London Depot—78, Great Queen St., Kingsway.

The above and all other Quadrant prices are now advanced by 5%.

What the Papers say about this Book.

"Pall Mall Gazette."

"These stories in dialogue form garnished with the forcible figures of speech of the British Tommy are racy and entertaining. It is an enjoyable book."

"The Glasgow Herald."

"These sketches will give anyone a more vivid realisation of life at the front than might be derived from many columns of descriptive writing. . . . . They are chips of the real thing hammered out of hard experience."

Overheard at the Front

Stories of the War in Comedy and in Deadly Earnest.

By Chas. G. Harper.

"The Scotsman."

"These brief, lively, and interesting tales reflect both the humours and the more serious aspects of the ordinary experiences of soldiers serving under the conditions of modern warfare."

Price 1/- net. By post, 1/3. From leading booksellers, or direct from the Publishers, Iliffe & Sons Ltd., 20, Tudor St., London, E.C.

"The Referee."

"If you want to have a heart to heart talk with our Tommies in the trenches, read 'Overheard at the Front.'"

"The Liverpool Weekly Post."

"Many of the incidents on which the stories are based create an immense amount of fun and laughter."

work and the usual squad drills is playing at the "childish travesty of war," as he puts it, and that the motor cycle volunteer is only fit to be made a laughing stock of, then it seems to me that it is high time that such corps were officially disbanded.

A.J.S., A Compy. (Surrey), 1st Motor Cycle Batt.

Sir,—In August 19th issue of *The Motor Cycle* two letters appear under the above heading, and as they apparently refer to the Midland Motor Volunteer Corps, we trust you will grant space for reply.

The letter from "M.B." was not replied to through the press, but there now having been a second attack, it is only right and fair to present and intending members that a reply should be made.

Taking the first letter, that from "A.G.M.," who signs as a Captain in the A.S.C., he is candid enough to state that he has seen little of the movement itself, and a reasonable deduction may therefore be made that he knows very little about the subject matter. How a captain, therefore, with such an admittance can bring himself to stand by the erratic epistle of "M.B." is past comprehension. "A.G.M." gives no facts which can be tackled in a manly way, but at the same time his remarks take such a sweeping course that they are apt to convey a depth of meaning at first glance that is non-existent, and possibly if he had known the following, he would have refrained from putting pen to paper on the subject chosen. Many of our members—hale, healthy men, who are playing at this childish travesty of war—have one and two sons giving of their best in the fighting line. Other members, too old for military service, yet well preserved, *plus* maybe a dozen of service age are engaged in important positions turning out shells, fuses, bayonets, grenades, castings, motors, chemicals, etc. These men are indispensable in their various positions, and whether they wish to join the Army or not, they are informed that they are more valuable to the war at home than in the ranks as a soldier. These are the sort of men "A.G.M." urges to give up their fooling, men above the average calibre; men who are taking the war most seriously, straining every effort to increase the output of war munitions, and who give up their short leisure to learn something of matters military, in case it may be necessary for them to form a last line.

What these men have also done as members of the M.M.V.C. may be of interest. When the Corps was first formed, there were members whose circumstances did not then permit of them joining H.M. Forces, and they trained for the time when they could. These men have since joined the Army, many of them having already seen a little of the "great grim tragedy." They have gained positions as officers or N.C.O.'s in such regiments as the Warwickshire, Sutherland Highlanders, Motor Machine Gun Section, Motor Transport, Royal Engineers, and Royal Flying Corps. Several of the men have passed examinations which they say would have been impossible but for their training with this Corps. Most of the remaining members are sworn in as a special police patrol in case of air raids, etc.

The following will also give some idea of the standard of training: A well-known Major-General has informed us that we are training on sound successful lines. A short time back the Adjutant of a Motor Machine Gun Section wrote us asking that particulars of our lectures should be sent him, as the O.C. desired them to be read to his men. Two officers in H.M. Forces have become honorary members, wishing to be associated with a Corps doing such excellent work. Apart from the Corps members, many recruits have been found for the Army. For instance, on Friday last, six motor mechanics were required for France at once. Our Commandant, assisted by several members, searched the town, and succeeded in obtaining them for the officer, who had come specially from London. This Corps offers no protection for men who ought to be in the Army, and has done excellent work, letters from officers of high rank giving testimony to this.

The letter from the three Privates of Burma is practically answered in the foregoing.

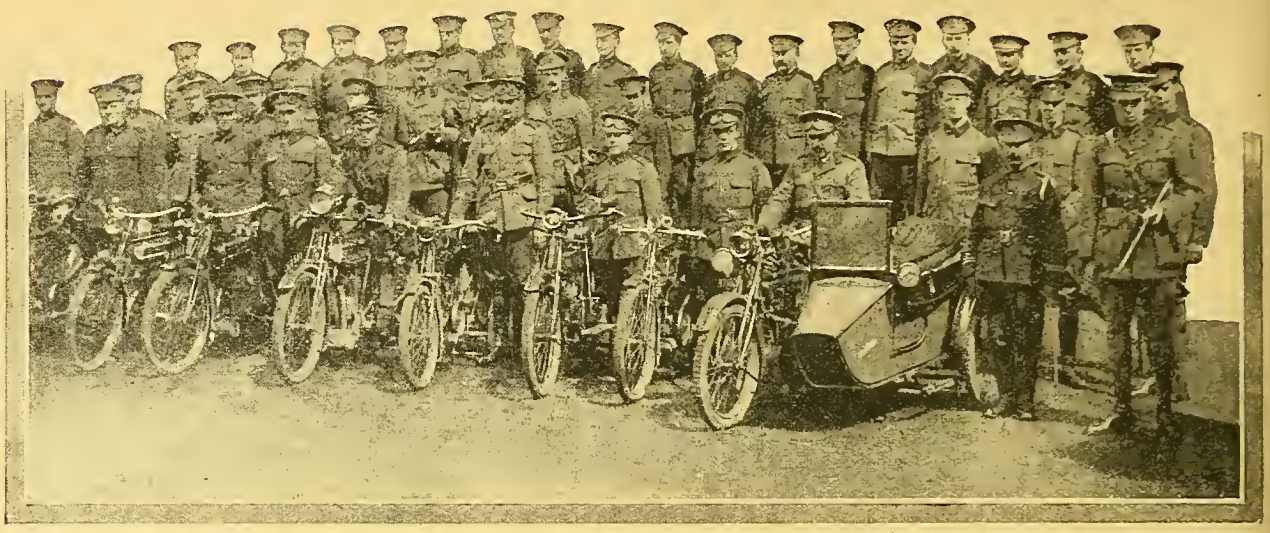
THE MIDLAND MOTOR VOLUNTEER CORPS.

Wear in Inclined Engines.

Sir,—Replying to "Spanner" *re* the rapid wear of engines in inclined positions, I must ask him to consider whether the trouble was entirely due to the fact of the engine being inclined. Personally, I do not think so. Has he examined the oiling arrangement for the cylinder? I think the trouble with the particular machines he had was that there was insufficient clearance between the crank case where the connecting rod works, and a couple of ¼in. holes would have saved reboring. A friend of mine has an inclined 4 h.p. tricar, air-cooled, of about 1904, which has all the original bearings and two of the original rings; and again, are the many different makes of inclined cylinder machines (twins) useless after 2,000 miles unless rebored? J. E. RAY.

A gathering of Harley-Davidson owners at Shakespeare's birthplace, Stratford-on-Avon. The meet was organised by the Premier Motor Company, of Birmingham, with the object of securing some cinematograph records of Harley-Davidsons (one of the latest American importations) in Shakespeare's country.

Midland Motor Cyclists' Volunteer Corps.



Despatch riders attached to the Mechanical Transport Section of the Liverpool National Volunteers.

ON Thursday the M.M.V.C. paraded at headquarters for lecture by Section Leader Richards on the subject of "Eye Sketching." Mr. Richards also dealt with a report on a village, explaining the necessary formulæ for obtaining information useful to the O.C. On Thursday next Q.M.S. Court will give a lecture at headquarters on "The Field Book and Plotting." Motor cyclists are invited.

Map Reading Tests.

On Sunday the men paraded at Castle Bromwich for a test of map reading and mobility. The corps was divided into patrols under section leaders. Each man was given a card with the name of his destination. No other information was shown. The men did not know whether their destination lay N., S., E., or W. There were five places selected: Gannaway Gate, Myton, Wedgnock, Bannor Moor Green, and Woodloes. Although the men were sent out in parties from the moment they had their card given them, they separated, owing to their destinations being different, but on reaching their destination they were joined by the members of their own patrol, that is, if each man were successful. The places selected were practically unknown, some of them not being marked at all on the ordnance map. In one instance the policeman patrolling the country was asked by one of the men for his destination; the reply was "he never heard of it." The scout afterwards found that the very spot where he had asked the policeman was his destination.

Commandant Silver had timed each man to reach his destination at a certain time, and had sent out despatch riders to reach the same place and time the men in, then hand them a despatch to bring in to the main body, information being given that they must expect an ambush. Again, the name of the place only was given; this time it turned out to be Asps. The men quickly located it, and now commenced the corps' usual work of reconnaissance.

Many of the men got through; in fact, 75% succeeded, which may be considered a satisfactory result.

Revolver Shooting.

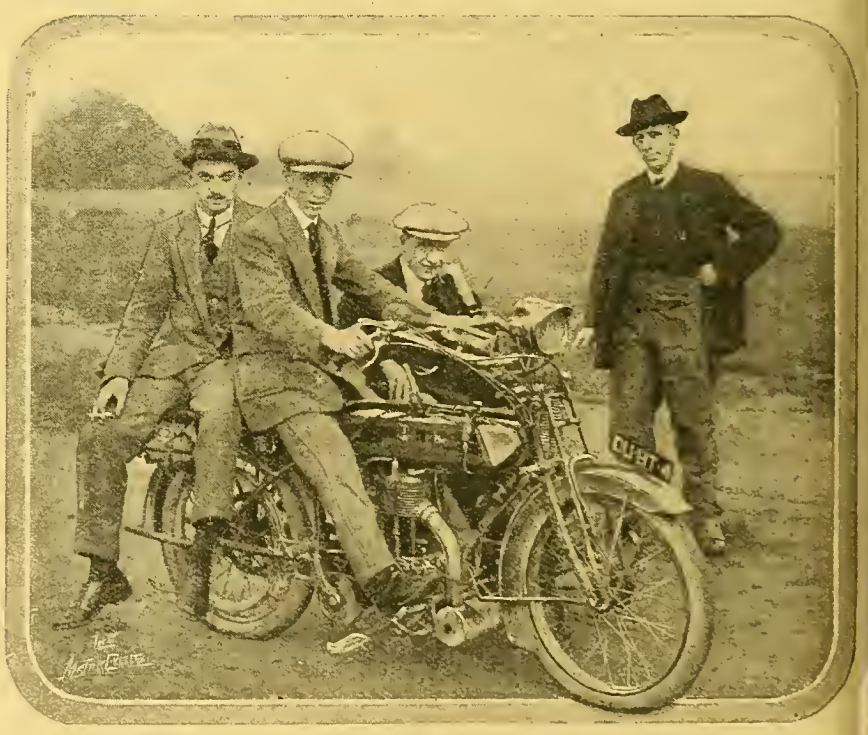
The day's manœuvres ended, the corps marched to the old camp at Wasperton. Here a small target was set up for revolver practice, and the men are provided with Colts—not toys—but Service revolvers.

Revolvers, unless understood, are more dangerous to the owner than the enemy; but the corps, before firing a shot, had instruction. Consequently, some good shooting at a small target from a distance of twenty yards was done.

New members are wanted to replace those who have joined the Colours.

The corps was the first in Birmingham to enrol as a police patrol, and it is now suggested that all other volunteer training corps should also form a special police section.

The members can read a map, make out a road report, and, if needed, show any military officer a short cut across country.



Three cyclist recruits for the Motor Machine Gun Service who were taught to drive a sidecar in less than a week.

XIV. THE DECLINE AND RENAISSANCE OF THE ROAD

The task of compressing the entire history of our road system, from its earliest beginnings, into the limits of a single volume, would appear to be one of considerable difficulty, yet the author of "The Highways and Byways of England" has not only accomplished this successfully, but has been able to deal so generously with the romantic side of the subject that the work possesses the sustained interest of a well-written novel. There is not a dry page in the entire book.

Obtainable from the publishers:

Iliffe & Sons Ltd., 20, Tudor Street, London, E.C.

And all leading booksellers and bookstalls.

Every Motor Cyclist

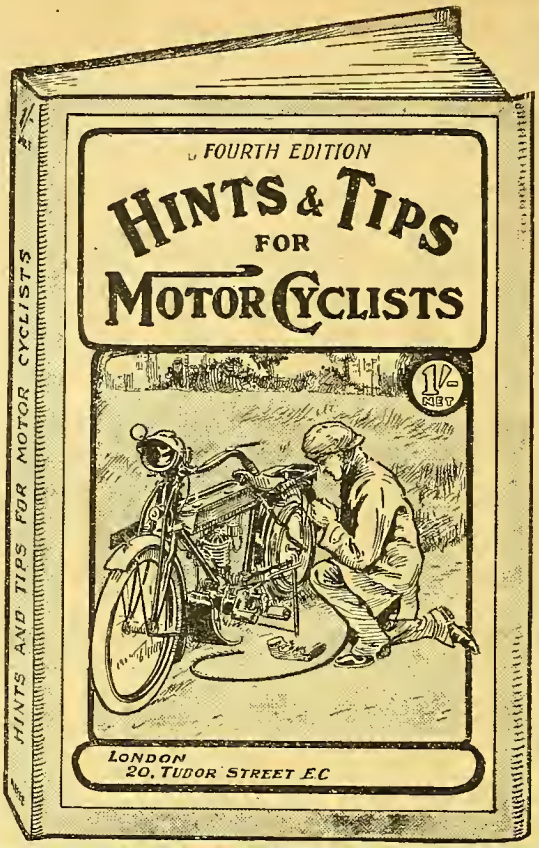
should draw upon this Storehouse of Motor Cycle Knowledge.

¶ "Hints and Tips for Motor Cyclists" contains what may be termed the cream of all motor cycling knowledge up to date.

The book gives hundreds of useful "wrinkles" and little items of information concerning the running, management, and repairs of motor cycles, culled from the experience of many years of riding, and covering every detail of the machine.

The arrangement is simple and straightforward and reference is simplified by an extensive index and marginal subtitles on every page.

Invaluable to the new rider.



The
Fourth Edition

Revised, Enlarged, and brought up to date.

Contains over 400 separate paragraphs.

¶ No matter what type of machine is used, this little book will be found of the greatest service to every rider.

TRACING TROUBLES

Second Edition

THIS handy little volume deals with all the faults to which motor cycles are liable, explains how they can be easily diagnosed, and shows how they can be rectified. Every conceivable cause of trouble is dealt with, and the remedy for it carefully explained. It is written in simple language by a practical motor cyclist of long experience, and fully indexed for ease of reference.

Price 1/- Net. By Post, 1/2.

THIS edition has been brought up to date by the author and new material added, including

— a section on — two-stroke engines.

Obtainable from ILIFFE & SONS LTD., 20, Tudor Street, London, E.C., *and all leading booksellers.*

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Timing the Magneto.

I should esteem it a favour if you would tell me as simply as possible how to time the magneto on a 1914 4 h.p. single-cylinder motor cycle.—C.M

The timing of the magneto should be as foliows: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break, and the ignition lever two-thirds retarded. This will mean that the explosion when fully retarded will take place when the piston has travelled about 3 mm. down the firing stroke.

Sidecar and Solo Riding.

For several months I have ridden successfully a 6 h.p. A.J.S. motor cycle and sidecar. I am anxious now to ride the motor bicycle as a solo machine, and shall be obliged if you will kindly indicate what precautions I should observe in the change. Is it safe to attempt solo riding with a cycle of this weight and power?—J.A.S

If you are used to riding a motor bicycle and sidecar, or even a pedal cycle, after the first few minutes there should be no difficulty whatever in riding the machine, especially if the roads are good. You soon get used to the weight, which is only really appreciably noticeable when wheeling the machine about before starting.

Pre-ignition.

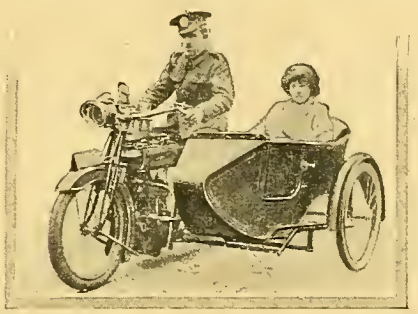
My machine is a 1914 4 h.p. single-cylinder with three-speed hub gear. After running well for, say, twenty-five miles at 15-20 m.p.h., it suddenly seems to lose all its power, and a strange rapid rattling and whistling noise becomes apparent, which no altering of the gear, gas, or air levers will cure. After crawling home, the machine will run quite well the next time it is taken out. It is a very stiff engine to start, and needs paraffin injection after an hour's stop on the road in the hottest weather. The rattling is like a very quick tapping on a mudguard, and I cannot locate it. Could you give me any idea of the possible cause of the trouble?—F.C

The trouble might well be caused by pre-ignition, due to your using a plug of unsuitable design. A broken or tight-fitting piston ring would also cause trouble of this description. It is practically impossible for us to diagnose the trouble accurately without seeing the machine, and the only cure is to take the engine down and carefully examine it.

Flooding Carburetter.

I should be much obliged if you would give me the reason for the following: Machine, 4½ h.p., 1915, chain belt drive. After a run I turn off tank petrol tap and milled screw which regulates the jet opening. On turning the tank tap next day, petrol flows from all parts of carburetter freely, but finally stops. On one occasion I tapped the carburetter while this was happening, and whether a coincidence or not, flooding ceased. Might I also ask you about a 1914 twin I had? When running on the level I had to keep playing with controls continually, as the machine seemed to gain speed without alteration of controls. The machine started very easily at all times.—S.A.D.

The trouble you experience is due to the needle valve on the carburetter sticking. During the night the petrol in the float chamber evaporates, leaving the needle valve in the open position. Upon your turning the petrol on the next morning the carburetter fills up, but owing to the needle sticking it is not shut off when it reaches the correct level; the result is that it overflows. Your tapping it, or the engine starting, moves the valve and stops the trouble. You should clean the float chamber out and see that nothing is causing the needle, float, or the little toggle arms to stick. The milled screw need not be altered; to do this upsets the jet adjustment. The trouble with the 1914 twin was probably due to the vibration causing the petrol level to vary



The quickest and most pleasant way from convalescence to fitness. Private Hugh Smith, A. and S. Highlanders, who was wounded at Neuve Chapelle, is now at home and enjoying runs on the Campion sidecar outfit shown above.

Fitting a Silencer.

Can I fit a silencer direct to the exhaust port and then attach an exhaust pipe to this, without interfering with engine efficiency?—W.J.

You certainly could fit the silencer direct on to the exhaust port, but it should not be so placed that it keeps the cooling draught from the exhaust port. Silencers have been fitted in this manner on some machines.

The Local Taxation Licence.

Early this year I registered a motor cycle, paying 5s. and local taxation licence £1. About a month since I sold to a friend, transferring registration (1s.) The new owner also paid the £1 local taxation licence. I have now bought another motor cycle. Will the £1 I paid cover the second machine till the end of this year?—D.B

Yes; the local taxation licence enables you to keep one machine at a time from the date on which you took out the licence until December 31st of the same year.

Piston Trouble.

I recently purchased a new lightweight two-stroke motor cycle, and had only ridden it a little when I noticed a knocking noise in the crank case. On taking the engine down I discovered that there was only one piston ring fitted and a piece cracked off the bottom of the piston. This piece had got into the crank case, and was causing the knocking. I have fitted a new piston, and I find the engine does not now pull as well as before, especially on hills. I have run it about sixty miles, so the piston should be run in. I think I have the magneto timed about right. Would you please tell me what you think may be wrong? Ought the machine to pull better with two rings than with one, and do you think that only having one ring was the cause of cracking the piston?—LIGHTWEIGHT.

It is no uncommon thing for a machine to run badly after a new piston has been fitted. The new piston and rings have to be properly run in before the old tune will return, but after about 200 miles the machine should be running as well as ever. With two rings you will retain the compression better, but perhaps there will not be quite so much speed. The fact of having only one ring would not account for the piston getting cracked.

Oversize Tyres.

I have an 8 h.p. sidecar combination with 650 mm. × 65 mm. voiturette-rimmed wheels, fitted with tyres of that size. These tyres, I find, are not nearly heavy enough for the back wheel, and wear unduly. What sizes of tyres will fit 650×65 mm. rims, and what size and tread would you advise me to fit on the back wheel?—J.T.J.

700 mm. × 80 mm. tyres will fit 650×65 mm. voiturette-rims. You can either fit these all round, or fit one for the driving wheel. The tread may be a combination pattern like the Rom, grooved like the Dunlop, or ribbed like the Palmer.

Pitted Platina.

Can you tell me why it is that the platinum points on my Ruthardt magneto keep on getting burnt up? I have just had two new points put on, and these are the third set, and they are going in the same way in less than three months, and it is becoming expensive. I shall be much obliged if you can tell me the cause.—J.H.C.

The trouble is undoubtedly due to the condenser connections being at fault, or to the condenser having broken down altogether. The condenser is carried at the end of the armature, and is connected direct to the primary winding. We think it would be best for you to send the magneto to Messrs. C. A. Vandervell and Co., Ltd., and let them overhaul it for you.

Lubrication.

Could you give the reason why no oil gets to the piston of my Triumph? No matter how much oil I pump into the crank case I cannot get it to smoke, and when I take the valve cap off I find the top of the piston quite dry and a rusty colour. The bottoms of the valve caps are the same colour as well. The engine keeps running all right but does not develop its proper power. I may say there are four ¼in. holes drilled in the piston, which I have had made on purpose to get more oil in the cylinder. —J.E.J.

It would appear that you have an engine with an unusually tight piston and rings. This would account for the fact that the oil does not pass into the combustion chamber, which is in itself an advantage, but too tight a piston causes loss of power and may lead to seizure. The ends of the piston rings should not quite touch when tested cold in the cylinder.

READER'S REPLY.

Belt Adjustments.

I have had considerable trouble with belt twisting in pulley, as described by "E.V.W." (August 12th issue). I at first had the same idea as "E.V.W." has, and when out for a run had only gone about ten miles when the trouble started. Another motor cyclist came along, and he advised me to reverse the belt and let it run in the opposite direction to that which it had been doing. This I did, with the result that I have not since seen any sign of the belt twisting or turning over as it did before.—F.T.C.

EXPERIENCES WANTED.

"D.R." (Pretoria).—Binks carburetter as fitted to 2¾ h.p. Douglas.

"A.B." (Bristol).—Aluminium sidecar bodies. Will makers send details?

"R.J." (Trawsfynydd).—3½ h.p. 1915 Rover and sidecar. Hill-climbing, ease of starting, and general reliability.

"A.W.W." (Bradford).—Riche's detachable air tubes. Durability and capability of holding the pressure for long periods.

"A.D." (Maidenhead).—1915 A.B.C. Model A. Reliability, maximum speed, lowest speed on top gear, hill-climbing, solo and with sidecar.

"A.A.S." (Pretoria).—Scott 1914 or 1915, and A.B.C. 1915. Reliability, durability, petrol consumption, and accessibility of cylinders.

ROUTES.

BEAMINSTER (DORSET) TO FENTON (STAFFS).—W.J.B.

Beaminster, Crewkerne, Yeovil, Castle Cary, Bruton, Frome, Beckington, Bath, Swainswick, Nailsworth, Stroud, Gloucester, Tewkesbury, Worcester, Kidderminster, Wombourne, Wolverhampton, Penkridge, Stafford, Stone, Fenton.

PLYMOUTH TO LONDON; distance secondary consideration provided roads are good.—A.B.

Plymouth, Ivybridge, Ashburton, Chudleigh, Exeter, Lyme Regis, Bridport, Dorchester, Wimborne, Ringwood, Cadnam, Totton, Botley, Bishop's Waltham, West Meon, East Tisted, Alton, Farnham, Hog's Back, Guildford, Ripley, Cobham, Kingston, London. Approximately 220 miles.

ABERDARE TO DULVERTON (SOMERSET).—W.N.E.

Aberdare, Caerphilly, Newport, Severn Tunnel Junction, Pilning, Clifton Downs, Long Ashton, Congresbury, Churchill, Cross, Highbridge, Bridgwater, Taunton, Milverton, Bampton, Dulverton.

NEWARK TO LUDLOW, avoiding big towns, and distance.—C.W.M.

Newark, Fosse Way to Leicester, Narborough, Sharnford, Coventry, Warwick, Stratford-on-Avon, Alcester, Droitwich, Great Witley, Tenbury, Ludlow. Approximately 140 miles.

HEREFORD TO RICHMOND (SURREY); also alternative route for return journey.—R.F.A.

Hereford, Ledbury, Tewkesbury, Cheltenham, Northleach, Burford, Witney, Oxford, Dorchester, Henley, Maidenhead, Windsor, Staines, Twickenham, Richmond; approximately 140 miles. Richmond, Twickenham, Staines, Virginia Water, Ascot, Wokingham, Reading, Pangbourne, Wantage, Faringdon, Lechlade, Cirencester, Gloucester, Ross, Hereford; approximately 150 miles.

MELTON MOWBRAY TO COLWYN BAY.—C.J.B.

Melton Mowbray, Six Hills Inn, Longhborongh, Derby, Ashbourne, Leek, Congleton, Holmes Chapel, Northwich, Chester, Hawarden, Holywell, Rhuddlan, Abergele, Old Colwyn.

HEMEL HEMPSTEAD TO BRIGHTON; avoiding London traffic.—W.H.

Hemel Hempstead, Watford, Rickmansworth, Denham, Uxbridge, Colnbrook (outskirts of), Staines, Chertsey, Pyrford, Ripley, Guildford, Cranleigh, Horsham, Cowfold, Henfield, Brighton.

NUNEATON TO YARMOUTH.—W.A.T.

Nuneaton, Watling Street, Ullesthorpe, Lutterworth, Market Harborough, Weldon, Oundle, Peterborough, Wisbech, King's Lynn, Swaffham, Dereham, Norwich, Acle, Yarmouth.

KINGSTON (LONDON) TO EXETER; avoiding bad roads.—H.G.J

Kingston, Esher, Guildford, Farnham, Alton, Itchen Abbas, Winchester, Bassett, Totton, Cadnam, Ringwood, Wimborne, Dorchester, Bridport, Lyme Regis, Colyford, Exeter.

BRIGHTON TO HUDDERSFIELD; avoiding heavy traffic.—J.W.L.

Brighton, Cowfold, Horsham, Cranleigh, Guildford, Farnham, Odiham, Reading, Pangbourne, Wallingford, Oxford, Woodstock, Long Compton, Shipston-on-Stour, Halford, Warwick, Kenilworth, Stonebridge, Coleshill, Lichfield, Abbots Bromley, Uttoxeter, Cheadle, Leek, Buxton, Chapel-en-le-Frith, Glossop, Holmfirth, Huddersfield.

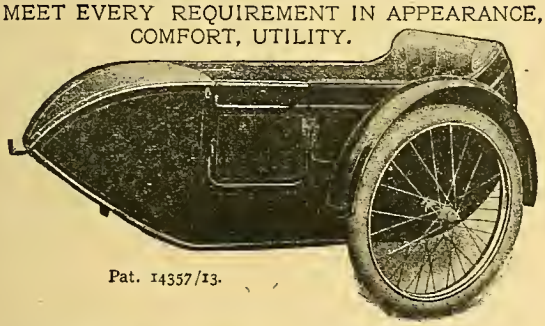
"BRAMBLE" SIDECARS

MEET EVERY REQUIREMENT IN APPEARANCE, COMFORT, UTILITY.



Pat. 14357/13.

Our No. 1 Model constitutes an entirely new and sweeping departure from all previous designs. As will be noticed from the illustration, there is no exposed tubular chassis. The framework, composed of angle steel, is completely closed in, and to it are directly bolted all connections and springing arrangements. It is perfect both in design and detail, and represents the accumulated experience of hundreds of private owners.

The .. Harcourt Radiators

THE PERFECTION OF AIR-COOLING.

The Harcourt Radiators maintain the full efficiency of engine under the worst conditions: OIL CONSUMPTION HALVED, OVERHEATING ABOLISHED.

WHAT USERS SAY.

MESSRS. E. R. RENDLE & SONS,
Somerton, Somerset, June 4th, 1915.
"We are pleased to say that we consider them (the radiators) **great,** inasmuch as the Morgan does not now overheat, is much faster on a journey, and the petrol consumption is very much reduced. We shall **strongly** recommend in future."

PRICES: Motor Cycles (singles) 15/-, (twins) 18/-, Cycle Cars 18/-.

Another Advertiser's Opinion of THE MOTOR CYCLE

Broomhill,
Longriggend,
June 18th, 1915.

To *The Motor Cycle*,

Dear Sirs,

I advertised an article in your paper, and on Friday morning I had three replies. By Monday evening I had received no fewer than twenty letters, including four cheques, from Scotland, England, Ireland, and Wales, **which shows what a splendid advertising medium your paper is.**

Yours faithfully,
ROBERT WILSON.

'THE MOTOR CYCLE' For Best Results.

OVERALLS MADE BY A PRACTICAL RIDER

Are the most satisfactory, because the man who rides knows what is wanted

My Overalls praised by every user, splendidly made, contain improvements not found in other makes. Improvements tried out on the road, and perfected during ten years motor cycling experience, after long tests of different styles of cut and qualities of material. A motor cycling suit that gives absolutely complete satisfaction always.

The price for complete Suit from - 35s.

Competes with prices asked by others for lower grade productions without my improvements. And I sell only dependable goods. Read all about these overalls in my booklet. Write for a copy. It will solve your clothing problems.—Irvine Smith.

MOSLEY & SMITH
Buttershaw, Bradford.

OUR OFFER THAT ENDS TROUBLE

gives exceptionally favourable terms to all who try our world-famed Skew Tyre, the most durable of all Motor Cycle Tyres, the tyre of greatest mileage, least punctures, and longest wear. A most liberal cash allowance for any old cover forwarded when ordering a new motor cycle Skew Fit the Skew to one wheel and see its superior wearing qualities against any tyre on other wheel and then avail of our further liberal offer.

Write for fully detailed Offer and Folder.

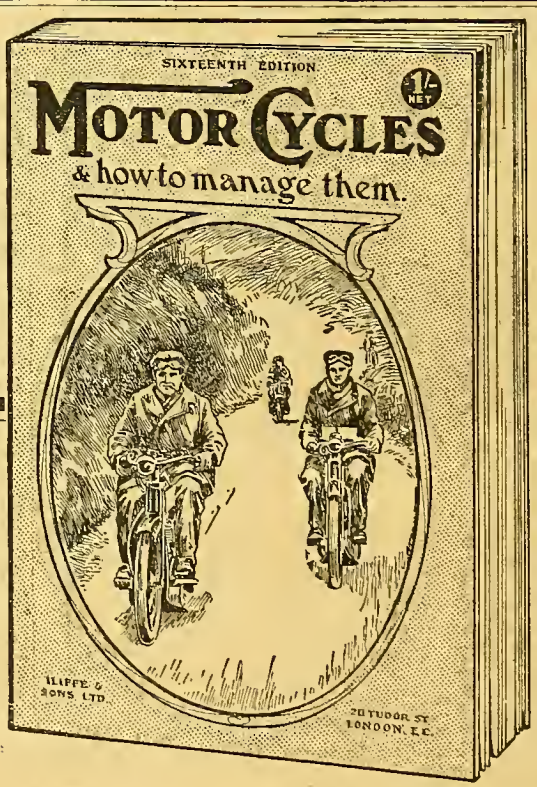
All about Economical Motoring.

To enjoy motor cycling *thoroughly* you must understand your machine *thoroughly*



Get the **16th Edition** (Revised) *of this useful book*

"MOTOR CYCLES & HOW TO MANAGE THEM" —the standard handbook for motor cyclists—will tell you practically all you want to know about your machine.

¶ There is no doubt as to the supremacy of this book over all others of a similar kind. It is constantly being checked and revised by the staff of "The Motor Cycle," and consequently carries the weight and authority of this journal.

¶ Its contents embrace a multitude of subjects relating to motor cycles, their care and management. It is clearly written and well illustrated. Every motor cyclist—whether beginner or experienced rider—should keep a copy handy for reference.

MOTOR CYCLES FOR SALE.

Miscellaneous.

HEBDEN'S Have in Stock:

1915 Enfield 6h.p. and 8h.p. Combinations, 3h.p. and 2¼h.p. lightweights.

1915 Indians, 3½h.p., 5h.p., and 7h.p., with or without sidecars.

1915 James 4¼h.p. 3-speed Combination and 2¼h.p. 2-stroke 2-speed.

1915 Wolf, 2¼h.p., 3h.p., 2-stroke, 2-speed; £31.

1915 Wolf-Peco, 2¼h.p., 2-stroke, 2-speed; £33.

1915 New Imperial-Jap, 2½h.p., 2-speed; 35 gns.

1915 New Imperial-Jap, 2½h.p., 2-speed, with clutch and kick starter; 41 gns.

1915 Wolf, 2½h.p., 3h.p., 2-stroke, 2-speed, not run 300 miles, as new; £27 complete.

2¼h.p. Motosacoche, with new Senspray mag., perfect; £12, a gift.

1914 Enfield 6h.p. Motor and Sidecar, complete as new; offers.

1914 7-9h.p. Indian Motor, 2-speed, brand new; best offer accepted.

1912 Humber, 3½h.p., 2-speed, 1914 engine, new Canoelet sidecar; £38, complete.

1912 Clyno, 5-6h.p., and sidecar, 2-speed; a bargain, £39 complete.

1913 8h.p. Williamson, water-cooled, 2-speed, and Canoelet sidecar, hood, screen, complete; £50, a gift.

1912 Enfield, 2¾h.p., 2-speed, complete; a gift, £23.

1912 F.N., 5-6h.p., 4-cyl., 2-speed, and sidecar, perfect; £19.

1915 5-6h.p. Rex de Luxe and sidecar, 2-speed, free engine, handle start, Whittle belt; a bargain, £32/10 complete.

1915 New Humberette 2-seat. Car, 8-10h.p., 3-speed and reverse, non-skid tyres on back; best offer accepted.

1915 New Williamson Cycle Car, 2-seat., 8h.p., 3-speed, water-cooled; £120.

Volunteer Bodies and the Critics.

ONE or two correspondents lately have criticised rather harshly the Volunteer bodies which are now so common in this country. The Volunteer movement, which was started with much promise and developed at an extremely rapid rate, has undoubtedly fallen very considerably in the estimation of the public during the last few months, and in our opinion the members have largely themselves to thank for the decline of the respect in which they are held. Last November, after the War Office was so frequently exhorted to recognise Volunteer Corps, a letter was forwarded to Lord Desborough, laying down the conditions upon which the Army Council was prepared to grant recognition to the Central Association Volunteer Corps. One rule was that only the names of those could be registered who are not eligible through age to serve in the Regular or Territorial Army; another, that there might be uniformity of dress among members, provided that the dress was distinguishable from that of Regular and Territorial units. It was also stated that the accepted military ranks and titles would not be allowed nor recognised, and that no uniform was to be worn except during actual training or while going to and from such training. This was always the accepted practice amongst Volunteers (afterwards Territorials) before the war. The terms of this letter are still the only conditions under which the Volunteer movement is recognised.

It would be interesting to know how many Volunteer bodies have acted up to the spirit of these regulations. Several times lately cases have been brought to light where members of Volunteer Corps clad in uniform closely resembling that of an officer in His Majesty's Forces, and minus the "G.R." red Volunteer armlet, have been saluted by soldiers, who imagined them to be commissioned officers; and, further, of Volunteers still clad in this striking dress disporting themselves in public places when not training. Such actions have confirmed the lurking suspicion of many people antagonistic to the Volunteer movement that it was a method of avoiding the real thing and yet being outwardly patriotic. This opinion is supported by the fact that Lord Kitchener, in his most recent appeal for recruits, asked members of Volunteer Corps to act up to their obligations to the best of their ability as recruits were badly wanted. Just how far this appeal penetrated it is not easy to say, but proof that it did not reach far enough is provided by the number of able-bodied men in the Volunteer movement still to be seen careering about our roads.

Our opinion of the Volunteer movement was outlined in our issue of April 8th. We pointed out then that so long as Volunteers fulfilled the requirements of the War Office letter nothing but good could come of the training received in a properly organised Volunteer body. We have in the interim had ocular proof of the extremely useful training many men had received prior to joining the Forces—a completeness of preparation which recruits in certain sections of the Army, who are hurried to the Front, could not hope to receive in the brief period of official training. It is, therefore, unfair to throw cold water on all the efforts of the enthusiasts who work whole-heartedly in endeavouring to make every man an efficient soldier. After all, there are many men engaged on munitions who choose to spend an occasional half-day with the Volunteers, and again there are many motor cyclists on the waiting lists of various sections who could not do better than employ their time undergoing training while waiting to be called up. We sympathise sincerely with the work of these men, but it appears likely that there will continue to be occasional more or less serious outbursts against the Volunteer bodies until they are taken over by the Government. When that time comes, and the corps is recognised, those who sneer at the Volunteers' efforts will treat the movement more seriously and with greater respect.

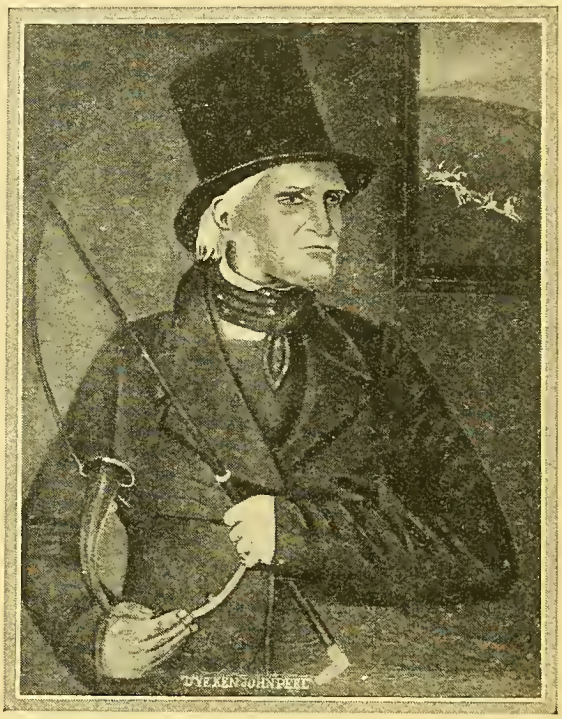
An index to the advertisements in this issue will be found on the page facing the back cover.

Wanderings in Peel-land with a Lady Driver.

By GEORGE D. ABRAHAM,
Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc.

"D'YE ken John Peel?" How often, the world over, has the question been asked and answered in the lusty chorus of the immortal song! Yet few "ken" the inner meaning and romance of the magical music until they have roamed that region of mountain and moor where the Northern Nimrod hunted, lived and died. The strange incomprehensible inappreciation of this fascinating northerly stretch of the Lake country suggests the thought that Peel is honoured more in imagination than reality. Yet probably this neglect is only due to lack of knowledge of "how to go and what to see." The motor, especially a sturdy sidecar outfit, provides the ideal means of settling these matters, and should one be driven by an enthusiast who revels in hills, a very sporting day's wandering may be enjoyed.

Comfortably ensconced in a Royal Enfield sidecar with Mrs. Mary Riley as driver, and her husband as optimist of the party when typical August dampness asserted itself so frequently, one felt that one was learning pleasantly much that might be useful to future explorers in Peel-land. Moreover, when these warring times are over Lakeland trials will be revived, and new hill discoveries were always in mind. This has been a record season for motors in Lakeland, and on the busy highway there was time to realise the fact as we sped northwards from Keswick, with Skiddaw's purple heights cloud-wreathed above us, and Bassenthwaite Lake sombre and still below on the left.



A portrait of John Peel, from the old original oil painting in the possession of the writer of the accompanying article.

Nearly six miles from the Lakeland metropolis we left the main road at High Side Farm. The way, ever rising gently, was narrow and rough, but altogether delightful. A wealth of wayside flowers, with hare-bells and Canterbury bells vying in colour with the distant blue horizon, greeted the eye and nose pleasantly. A sudden dip over into the depths of a wooded gorge and a rugged climb on its farther side up a gradient steeper than 1 in 4 tested driver and machine alike.

Wayside Gooseberries.

The clouds had now cleared, and up on the right the silvery streak on Skiddaw's northerly front showed the Dash Falls, which, had time permitted, would have been well worth the *détour* for a closer view. Instead of this the rich supply of gooseberries on the roadside by a mountain farm attracted attention. We were busy with these when the man of the place appeared in apparently friendly mood. "Wadn't ye like to coom into th' garden?" he said smilingly. It rested with the writer to recognise the Cumbrian sarcasm and suggest an onward move.

A motor cyclists' camp in John Peel's country. Bassenthwaite Lake is in sight.

The small and pretty but little-known lake of Overwater gleamed below on the left. At four important road ends we swung away to the left, with the Dash behind and the dam in front which holds back the flood waters of the lake. Two capital hills had to be climbed ere the village of Uldale was passed through on the way to Ireby. Here we were in real touch with Peel-land, and in touch, also, with a surprising and decep-

Wanderings in Peel-land with a Lady Driver.—

tively deep water-splash, which cooled the driver's ardour slightly. Upon the left was the grey hamlet of Ruthwaite, where the famous huntsman lived in the height of his hunting career. A most interesting and almost unknown treat was found in Ireby. At the Sun Inn the landlord, Robinson Bell, the genial grandson of Peel, showed us some curious relics of his famous relation. The horn, hunting crop, stirrups, and bit were amongst the collection, which is still intact despite, as Bell said, "many a temptatious offer fra America and nearer hame." It was pleasing to learn that a well-known lover of Peel-land has a promise of the refusal of the priceless relics, and if they leave the little village they will go to London as national property.

In due course we were bound for Caldbeck over Aughtertree Fell, high up "ower t' trees" and amongst the gorse and bracken, where sly Reynard finds evening cover even to-day ere he dodges down to the valley farms. The road which runs from Uldale to Caldbeck was shortly joined, and there came a delightful run over the lonely moorlands of Uldale Common. The spirit of the great huntsman seemed in the breeze, which swept heather-scented over the foothills. Shapely Skiddaw kept distant sentinel over the wilds, where few signs of human endeavour were visible. At the first house on the right and within about fifty yards from the road we came into practical touch with John Peel once more.

Greenrigg, near Caldbeck, where John Peel was born in 1776.

This was at Greenrigg, where, according to the present tenant, who is also a descendant of the family, the huntsman was born in 1776. He went to Ruthwaite in early manhood, but returned late in life. In his own words he came here "because folk nivver dee at Ruthet." He said, "I'se gaen to Greenrigg to be handy for t' kirkyard." It was here he passed to the happy hunting-grounds in 1854.

A visit to the little, grey dwelling, with its tiny peep-hole windows placed with peculiar irregularity, proved most fascinating. The problem of rearing the family of fifteen young Peels in such diminutive space seemed insoluble. How could the two small bedrooms, where to swing a fox would have been impossible, suffice for so many? Lack of space forbids the story of all we saw and heard at Greenrigg. Perhaps the most impressive thing was to sit silently in the oaken inglenook in the kitchen and remember that here on a wild winter's night the famous song was brought into the world by John Woodcock Graves. Success came soon. It became the slogan of the Border Regiment, and, in the Crimea and the Boer War, Peel's "view-halloo"

A characteristic mountain road under Saddleback, on the return journey from Peel-land, by the old road from Penrith to Keswick.

echoed through the trenches. News had just come of the terrific Border onslaught in the Dardanelles—of how to the tune of "John Peel" the Northern hunters of death had leapt fiercely from the trenches, the weird music rising in mad roar above the noise of the guns. Small wonder the Turks ran—it seemed more wonderful they ever stopped running. But alas! many a huntsman will never return to his home on the hill.

Then we set forth from the open moor and gained the flowery hedgerows once more near Caldbeck. At the top of the steep descent into the village, a turning on the left gives access to the "Howk," a wonderful water-worn gorge, where caves and cascades hide amidst the foliaged depths. Though little known, it is one of the sights of Peel-land that certainly should not be missed. In Caldbeck itself a visit to the huntsman's grave in the picturesque old churchyard was made, and a "crack" or two with some of the natives brought forth many a story of the great man of the district.

Peel's Marriage.

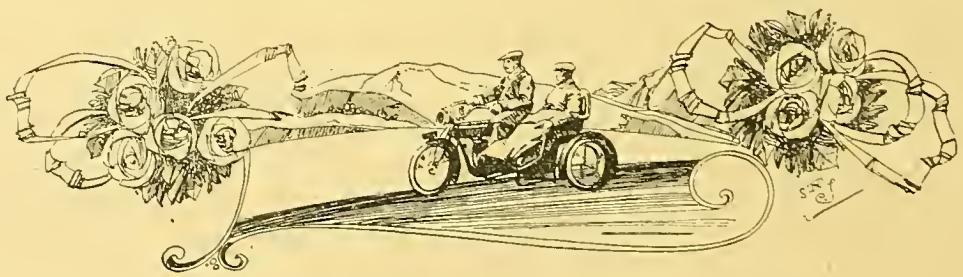
As we travelled over the splendid road to Hesket Newmarket a backward glance showed a little white cottage amongst the trees on the westerly hill. The sight recalled the typical story of Peel's marriage to Mary White who lived up there. His fondness for Mary was unknown even to his parents until the banns were called in Caldbeck Church. Then Mary's mother stood up at once and forbade them saying, "She's far ower young!" But John was not so easily beaten. He appropriated Mary and set off to Gretna Green on Binsey, his favourite horse. There the pair were married, and on their return the mother had so far relented as to allow the orthodox service to go forward.

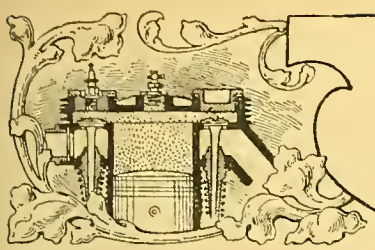
At Hesket Newmarket, with its quaint town hall, ancient covered well, and rusty bull-baiting rings let into the ground close by, much could be learnt of Peel's adventurous time. Once out of the village we followed the road on the right which led back to civilisation under the dark crags of Carrock and through Mosedale and Mungrisdale. The sight of Saddleback's serrated crest high up on the right betokened the approach to the main road eight miles from Keswick.

To add a sporting finish to the outing the old road was entered upon by branching to the right just beyond Threlkeld village. Past the kennels of the Blencathra Hounds, which now hunt much of Peel-land with dogs descended from the famous pack, we mounted over a good road until, bearing sharply to the left, a long hill led downwards steeply. From the beautiful glen of the Glenderaterra river an impressive hill sprang upwards on the mountain's front. The sight roused our driver. The Enfield roared forward up

A typical scene in Peel-land—at the crest of Uldale Hill. Skiddaw is seen on the left, with Overwater below on the right—Mrs. Riley's 6 h.p. Enfield sidecar in the foreground.

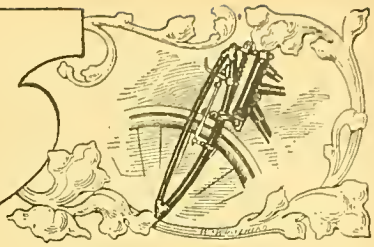
the slope to where some bushy trees masked a hidden corner. This surprised everybody, for it swung round in the curliest of hairpins on a gradient approaching 1 in 3. Our speed was excessive, the pillion rider sprang off with a startled cry in record time, and the machine dashed sideways round the slippery bend. For an instant there was danger of sliding bodily over the precipitous edge, but with astonishing skill in the gentle use of the clutch our driver recovered directness. She was worthily proud of a non-stop climb, for this Brundholme Hill, nearly a mile in length, must prove a problem to any expert, and the unprotected precipitous downward prospect added to its impressiveness, especially in the gloom of evening. The homeward way was followed around the wooded slopes of Latrigg by a hill route which will doubtless have practical use in future trials.





PISTON RINGS.

Their Treatment.



WHEN taking down an engine for cleaning or overhauling, it is rare that the pistons and rings receive that attention which their importance warrants. Consider the work which they perform with the engine turning over at 1,800 r.p.m., *i.e.*, thirty revs. per second, when the piston has to commence work, travel the length of the stroke, and stop in one-sixtieth part of a second! The wear we should expect to be tremendous, yet, thanks to a more or less efficient method of lubrication, this wear is scarcely noticeable to the naked eye even after a season's running. There are, however, certain signs of hard work which should be observed and heeded if the engine is to maintain its efficiency.

Vertical Fit.

Examine the rings first for vertical fit in the piston groove. The grooves and rings should be thoroughly cleared free of burnt carbon. It will be found that when there are three rings the top ring is distinctly slack, the centre ring slightly better, and the bottom

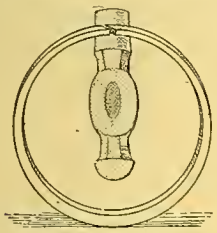


Fig. 1.—Spreading ring to fit the groove.

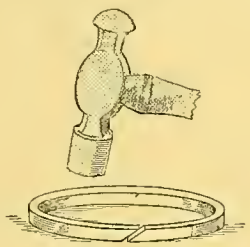

Fig. 2.—Improving the fit in the cylinder.

ring practically perfect. We can find no explanation for this except on the ground of unsatisfactory lubrication. It is worth while to remedy this fault, at any rate in so far as the top ring is concerned, and it can be done either by fitting a new ring or doctoring the old one. On no account should a new ring be taken in a haphazard fashion, cut or split diagonally at the thinest portion for the slot, and then passed as satisfactory. Such a ring is not true, and, even if it were originally a dead true fit in the cylinder, after slotting it becomes oval and will probably wear the cylinder oval before it becomes a good working fit. The correct plan is to cut the slot, then compress the ring until the slot is closed, and turn it in the lathe a true fit for the cylinder.

Hammering the Rings.

If the wear is slight it is quite possible to spread the metal by hammering it while poised on an anvil. The position is shown in the sketch (fig. 1). A very light riveting hammer with a narrow head is used. The ring is rested firmly on the anvil, and the inner portion of the circumference is tapped smartly with the hammer on the spot where it is balanced on the anvil. The metal will be gradually spread, and the ring must be slowly revolved until the whole of the inner circumference has been dealt with. The greatest of care must be exercised in using the hammer, for if any unsupported portion of the ring be struck it will snap like a carrot. Hammering seems to have a good effect upon the metal, for rings undoubtedly wear better and hold the compression longer when thus treated. One well-known concern uses a ring which depends entirely upon the hammering action for obtaining the necessary spring. In this case, the rings are parallel in thickness all round. The force of the hammer blows is graduated, being greatest opposite the joint and least just at the joint. The spring is thus of a uniform nature, and as the rings are of the same thickness all round they fill the groove better and afford fewer opportunities for gas leakage.

We must now examine the rings for slackness in the cylinder. If the fit has been good the rings will have become polished to a uniform brightness all round. Any signs of blowing past caused by the rings not being in contact with the cylinder wall will be indicated by that portion being of a dull and brownish colour. The metal can again be spread by judicious hammering. This time (fig. 2) the ring is rested flat on the anvil or iron plate and held down firmly by the hand while the hammer taps the non-fitting part. From time to time it should be tested in the cylinder bore, and only passed as being satisfactory when a cigarette paper is held tightly at every portion of the circumference.

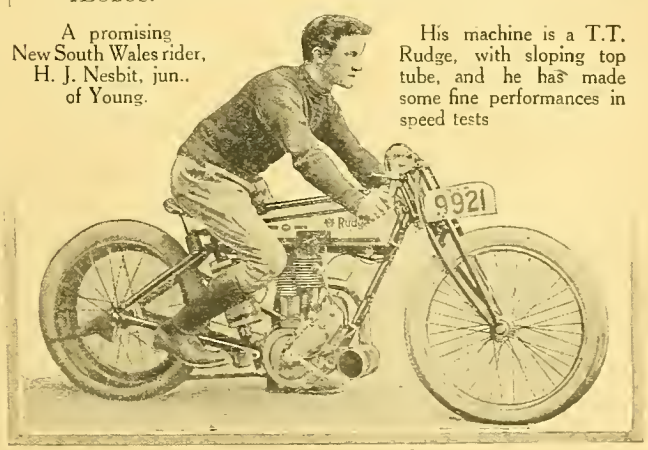
Cylinder Wear.

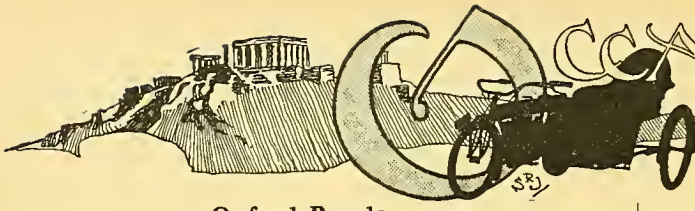
In course of time the cylinder will become worn unevenly, and as little can then be done with it it is as well to send it up to the makers to be re-ground and have a new piston fitted. As a palliative, in order to put off the evil day when a thorough overhaul becomes essential, it is possible to obtain a certain amount of improvement by fitting new piston rings.

—ÆOLUS.

A promising New South Wales rider, H. J. Nesbit, jun., of Young.

His machine is a T.T. Rudge, with sloping top tube, and he has made some fine performances in speed tests





OCCASIONAL COMMENTS

BY 'IXION'

Oxford Roads.

I can assure Mr. Vulliamy that if it had not been for the urgent need of municipal economies in war time, Oxford—and one or two other towns—would have been black-listed long since in every progressive motor journal. There are not a few districts where the local authorities have encouraged or organised motor 'bus services without the least idea of the radical road reforms necessitated by the advent of fast heavy traffic. Most of the suburban road surfaces round Oxford are the absolute limit; they present the semblance of corrugated iron, and are calculated to break up any car or cycle regularly traversing their iniquities. Such neglect is only pardonable in view of the Government prohibition of large outlays on every avoidable purpose. We can regard frightful roads with more indulgence when the locality concerned is an obscure provincial district; but when places like Oxford and North Devon, attractive to every sight-seer, home or foreign, become practically dangerous to wheeled traffic, it is time to protest; and as soon as war is over, and expenditure again becomes possible, there will be some frightful rows.

A Safe Lamp Position.

Some while ago I remarked on the fact that the head lamp usually gets more or less crumpled when a machine sustains a fall, and that, if the trade regards this rather unnecessary expense with equanimity, the private owner detests it. My strictures were mild, because the head lamps of that era were extremely bulky contraptions, and I could devise no less vulnerable position for them. However, I return to the subject because I am riding a mount which would almost have to be pulped in a steam press before its lamp received injury. Its handle-bars extend laterally for about 6in. on each side before they bend round towards me, and a small Ward and Goldstone electric lamp is centrally mounted just before the steering head. I have made experiments, and have satisfied myself that this lamp will outlast a hundred tumbles in its present position without suffering so much as a broken glass, and, if it is too small for a 7 h.p. speed merchant's twin, it is big enough for a legal limit average in inky darkness, and there is sufficient clearance for the remarks to hold good of such lamps as are fitted to the electrically equipped Indian or Harley-Davidson. The point is one fraught with real economy to solo riders of the semi-reckless type, who count on two or three purlers per season. I well remember how I was despatched some years ago to report a Six Day Trial on a very inefficient mount; and, what with frequent repair stoppages, the lack of sufficient colleagues, and the number of hill-climbs, I spent the entire week blinding at top speed over atrocious roads. I took seven different tosses, each of which affected the head lamp. On three occasions I was able to buy, beg, or borrow a new lamp, so that the week cost me four head lamps; on four of the tosses a lamp already reduced to the similitude of a concertina bore further injuries with resignation. So I plead for compact electric lamps, fixed slightly in front of the steering pillar, in conjunction with handle-bars which do not curve backwards too hurriedly.

Two Falling Tricks.

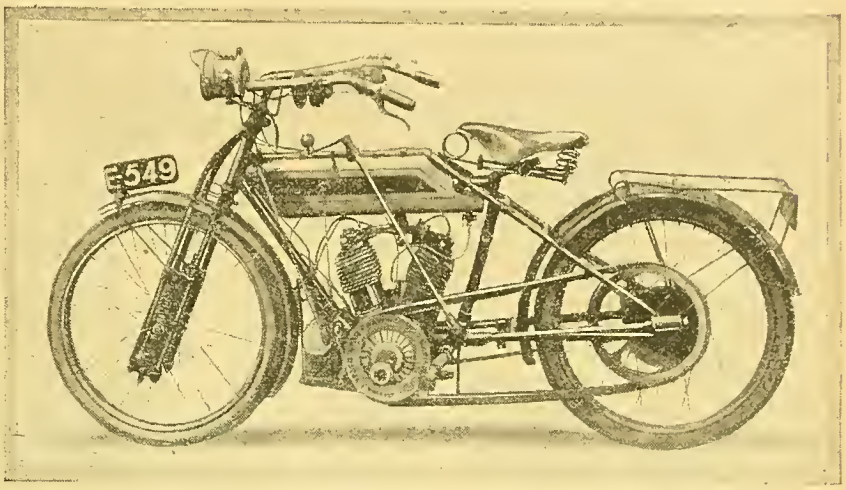
The other day some of us were discussing tumbles which we had experienced, and a well-known competition rider there and then gave an exhibition of methods which he alleged had more than once saved him from serious injury. His first trick consisted of seating himself on a chair, facing its back, with one leg on each side of the chair, and his head tucked down towards his stomach over the back of the chair. He then allowed us to tilt the chair over backwards, as often as we wished, and, maintaining his position, took the weight of the fall on his shoulders quite harmlessly. He alleges that whenever he takes a bad toss at speed he tucks his head into his stomach, and that his shoulders will take the impact with anything except a traction engine or a stone wall. The second trick showed how to accept a head on fall, *i.e.*, if he were jerked over the handle-bars. He knelt down on the hearthrug, threw his chest out, and his head back, with his hands tucked into the small of his back, and then overbalanced forwards, without slackening the rigidity of his body, taking the impact on the swell of his thrown-out chest. Most of us baulked on the first attempt to imitate him, but we soon learned that we could not possibly hurt ourselves if we maintained the rigidity of the body. He asserts that a very heavy frontwise fall can be taken in this way without other injury than a bruised chest; but that if a rider loses his presence of mind, and attempts to save himself instinctively in such a fall, he will break an arm and scrape along the road on his face and chin, not to mention the chance of a fractured skull or jawbone. The first trick struck me as especially valuable, and likely to protect all the most vulnerable points of the anatomy. He further asserted that on two occasions when he had been thrown over his handle-bars he had escaped unhurt by throwing his head backwards and landing on his feet, afterwards running off the impetus, but when we invited him to demonstrate the method, by charging a log laid on the road, he not unnaturally changed the subject! His conversation reminded me of a very neat save I once witnessed when pacing a road-racing pedal cyclist. We ran round a bend to discover some cows so close on us that I saw no hope of pulling up in time, and the whole width of the road-way was blocked. I chose a softish-looking place in the hedge, and took it at an acute angle. The cyclist leapt off his saddle on to the road, and as he ran off his impetus swung his machine clean off the road into the air, pulling up just short of the foremost cattle. I never saw a smarter exhibition of coolness, for he was well inside the time record which he was trying to beat, and desired to safeguard his machine, and finish inside the record, which we ultimately did, as my place in the hedgerow proved even softer than it looked.

The Bamford Variable Speed Gear.

AN INTERESTING DEVICE, EMBODYING AN UNDER-GEARED BELT RIM.

A NEW speed gear of the infinitely variable type, the design of which makes possible the employment of a 9in. expanding pulley and a range of gears from 4-1 to 12-1, together with a simple and ingenious belt-tensioning device, will, we have no doubt, open up a further field of utility for this type of gear. The principal novelty of this consists in the undergeared rear belt rim which maintains correct belt tension.

From the illustrations on this page the working and construction of the Bamford gear may be easily followed. The rear road axle is formed with a cranked portion towards the belt pulley end. On the central part of this axle the road wheel is mounted. The hub of this wheel carries an internally toothed ring. Meshing with this is the belt rim pinion, which rotates on the cranked portion of the road wheel axle. This axle is so arranged that through the medium of suitable hand or foot levers it may be turned in either direction, thus rocking the eccentrically placed belt pulley aronnd the internal gear and causing it to approach nearer to or move further away from the engine pulley, so that the belt can he maintained at an even tension on all gears. In this operation it should be noted that the road wheel, being centrally disposed on the axle, does not move. The gearing down of the driven belt pulley, which on the experimental model is in the ratio of 3 to 1, is an important feature, as it makes for what may be considered ideal conditions for a belt drive, viz., a 9in. engine pulley on to a 12in. rear pulley, an increased belt speed in feet per minute, with a corresponding redncton in the strain on the belt. This is very noticeable when travelling at a slow speed on a 4 to 1 gear, all traces of the usual belt snatch being eliminated. The drive is also of reasonable length.



An old pattern Rex machine fitted with the Bamford variable gear.

A Test on the Road.

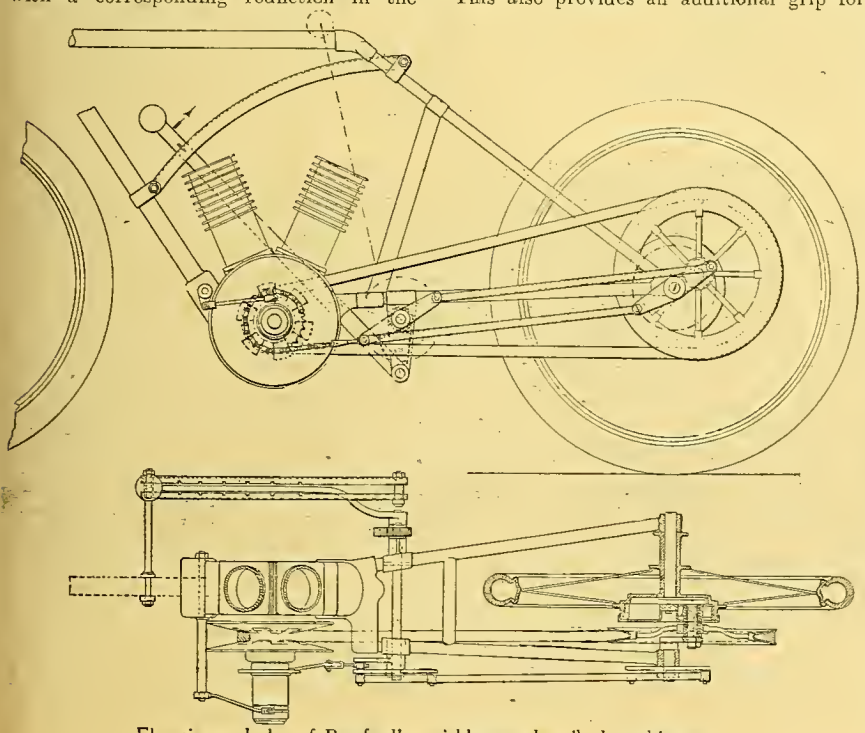
The machine fitted with this gear is a 5 h.p. twin Rex, which has been tested now for some 800 miles, a goodly portion of this being covered in the Peak District of Derbyshire.

The engine pulley, it will be noticed, has flanges which intersect at a point where the gear ratio drops to 7 to 1. This also provides an additional grip for the lower gear drives. The movable pulley flange on this machine is controlled by a spiral spring. For solo work this has proved satisfactory, and it has undoubtedly the merit of extreme simplicity.

The appended table will give an idea of the pulley diameters and the range of gear:

Variable engine pulley.	Rear belt rim.	Gear ratio.
9in.	12in. plus 3 to 1 reducing gear	4 to 1
7in.	12in. plus 3 to 1 reducing gear	5 to 1
5in.	12in. plus 3 to 1 reducing gear	7 to 1
3in.	12in. plus 3 to 1 reducing gear	12 to 1

The internal reduction gear is fitted with a dnstproof cover and rnns in grease; thns the inventor claims that it is silent in action, very efficient, and, as the whole forms a unit with the road wheel, the latter can be instantly detached. Furthermore, he states that this design of variable gear readily lends itself to the springing of the rear wheel. Mr. Bamford is desirous of getting into touch with manufacturers with a view to placing the gear on the market.



Elevation and plan of Bamford's variable gear described on this page.

AUSTRALIAN MOTOR CYCLISTS AND THE ARMY.

Perth (West Anstralian) motor cyclists have suggested to the Australian Minister for Defence the formation of a motor cycle and sidecar machine gun battery for an Oversea contingent, enclosing in support of the offer cuttings from *The Motor Cycle* showing the success of the Army motor cyclist sections. The West Australian Motor Cycle Club, through its hon. secretary, Mr. J. W. Armstrong, subsequently offered to purchase from its funds a motor cycle and sidecar snitable for a machine gun. We are told that there are at least 1,000 experienced motor cyclists in Australia anxious to enlist in a section of which they know something. Already a few have left for England, and others are thinking of doing the same, paying their own fares.

The Service 2¾ h.p. Two-stroke Sidecar Outfit.

THE Service Co., of 292, High Holborn, have now in their showrooms a new production in the way of a moderate-priced sidecar, which should help considerably towards filling the demand for a low-priced outfit which needs to be at the same time inexpensive to run.

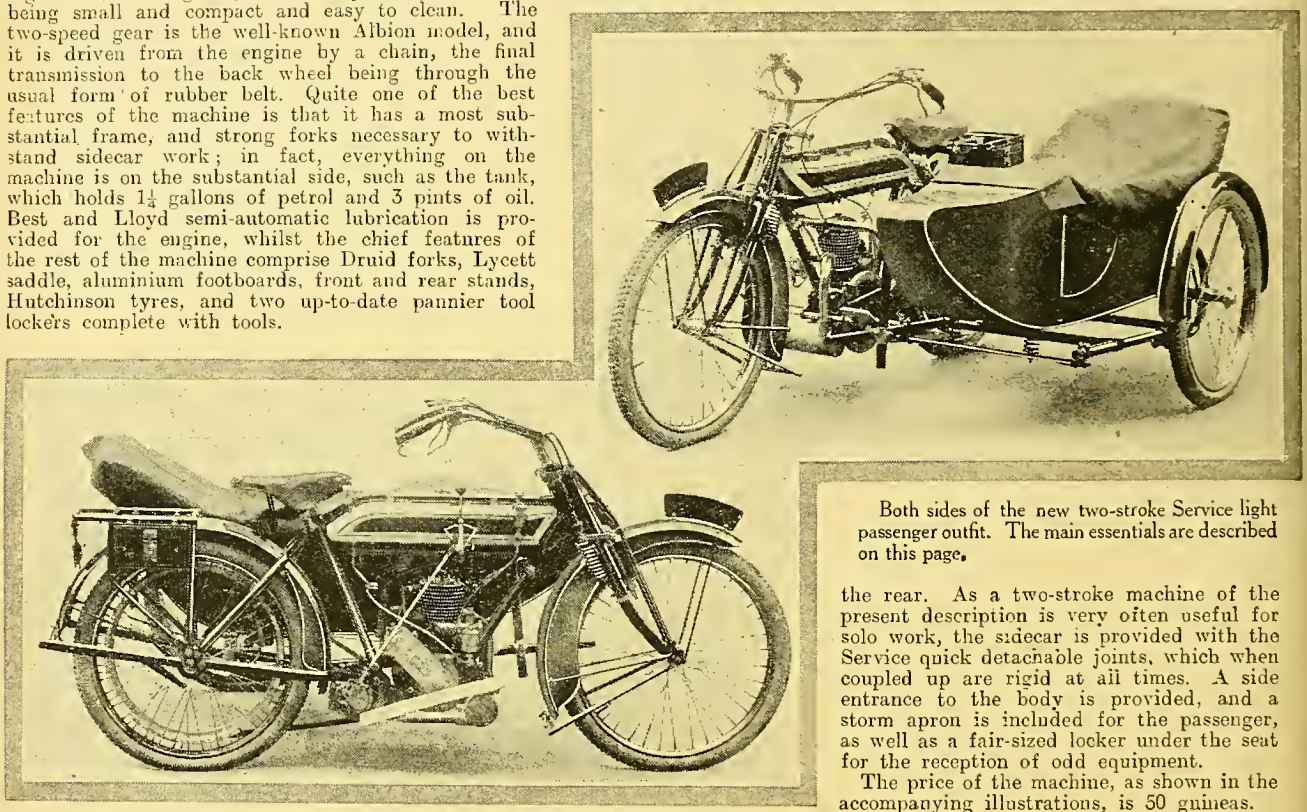
Dealing first with the machine by itself, the engine is a 2¾ h.p. two-stroke Peco, which has an original and highly satisfactory form of lubrication. The carburetter fitted is an Amac, whilst the ignition is operated by a high-tension magneto, the complete power unit being small and compact and easy to clean. The two-speed gear is the well-known Albion model, and it is driven from the engine by a chain, the final transmission to the back wheel being through the usual form of rubber belt. Quite one of the best features of the machine is that it has a most substantial frame, and strong forks necessary to withstand sidecar work; in fact, everything on the machine is on the substantial side, such as the tank, which holds 1¼ gallons of petrol and 3 pints of oil. Best and Lloyd semi-automatic lubrication is provided for the engine, whilst the chief features of the rest of the machine comprise Druid forks, Lycett saddle, aluminium footboards, front and rear stands, Hutchinson tyres, and two up-to-date pannier tool lockers complete with tools.

One little point we noticed about the new Service machine was the provision of a locking thumb lever for the rear stand, which, as most motor cyclists know, is wanted sooner or later to prevent rattle of the stand.

A Coachbuilt Sidecar.

The sidecar fitted to the new Service machine is a Royal Leicester, having a coachbuilt body enamelled in dark green, and the frame is of the underslung type, the suspension of the body being by coil springs in front and leaf springs at the rear. As a two-stroke machine of the present description is very often useful for solo work, the sidecar is provided with the Service quick detachable joints, which when coupled up are rigid at all times. A side entrance to the body is provided, and a storm apron is included for the passenger, as well as a fair-sized locker under the seat for the reception of odd equipment.

The price of the machine, as shown in the accompanying illustrations, is 50 guineas.



Both sides of the new two-stroke Service light passenger outfit. The main essentials are described on this page.

Eight of the sixteen despatch riders attached to the 2/6th Batt. Suffolk Regiment. Reading from left to right: Lance-Corporals A. Cant, S. Woods, B Gates, Corporal W Beales, Lance-Corporals L. Potter, S Townsend, Pells, and Read. All the despatch riders attached to this regiment are mounted on three-speed Triumphs.

In answering these advertisements it is desirable to mention "The Motor Cycle."

"THE MOTOR CYCLE" RECRUITING SECTION.

WITH last week's inspection of recruits for the Motor Machine Gun Service recruiting for the ranks was brought to a close for a short time. As soon as motor cyclists are wanted for the formation of new batteries, an announcement to that effect will appear in these columns. In the meantime, those who found it impossible to attend last week's inspection are asked to return at once the railway warrants which were issued. A number of these warrants are outstanding.

There are vacancies for a limited number of experienced motor cycle mechanics and car drivers for the A.S.C. In each of these sections the pay is 6s. per day. Qualified men should enclose two references when applying. There will be an inspection of men of this class at the Coventry Recruiting Office, Masonic Buildings, Little Park Street, on Wednesday next (the 8th inst.) from 2.30 to 4 p.m. On the same day those motor cyclists in Warwickshire, Worcestershire, Gloucestershire, Buckinghamshire, and Berkshire, who wish to be placed on the Royal Engineers waiting list of despatch riders, will be tested in riding and running adjustments. Experienced riders only will be accepted, and candidates must bring their own machines.

The following were accepted last week for the M.M.G.S.:

Baxter, A. G.	Macfarlane, J.	Summers, J.
Broadhurst, E.	Marrison, J. W.	Thomas, K.
Broadhurst, J.	Meakins, W. A.	Tidman, I.
Byway, C.	Newport, J. A., jun.	Turner, A.
Davis, A.	Sarsons, B. J.	Vieira, C.

Kiff, P. J.		

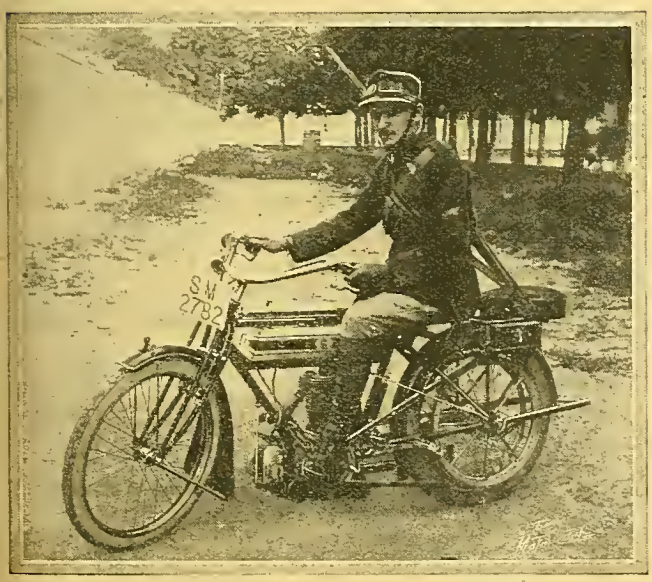
MILITARY NOTES.

ITALIAN MILITARY MOTOR CYCLISTS.

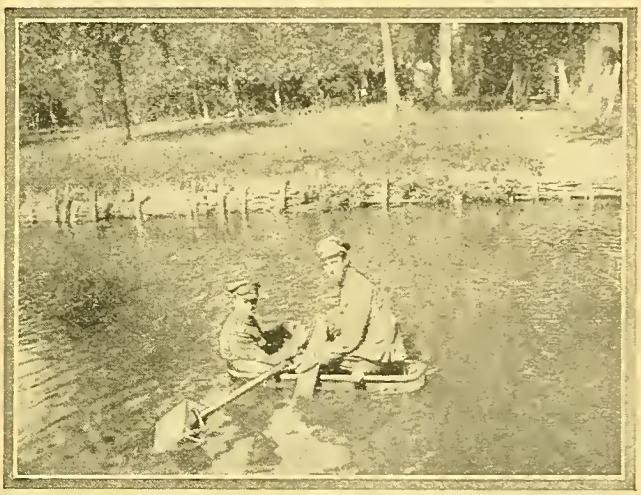
ITALIAN motor cyclist volunteers, illustrations of whom appeared in a recent issue of *The Motor Cycle*, are doing good work. They have been distributed in several of the towns near the fighting line now occupied by the Italian Army, and they are doing continuous service as despatch riders. As in England, the majority of the well-known competition riders are on active service, such names as Baj Badino (Douglas), Frinzi (Rudge), Malvisi (Ariel), and many others whose names will be familiar to our readers by reason of their appearing as winners in Italian motor cycle competitions, are now on much more serious work. Maffeis, holder of the Italian kilometre record, is now in the Flying Corps, also Borgotti, another Douglas competition rider.

His Majesty the King of Italy, who has been at the Front continuously since the commencement of the war, often makes use of a motor cycle and sidecar. Of course, the greater part of the time he is travelling in a car, but there are certain inaccessible places which can be better reached in a light three-wheeler than a big high-powered car.

Lieut A. M. C. Scott, late of the Premier and Daimler companies, is now at the Front in the No. 10 Squadron of the Royal Flying Corps, a section which is becoming increasingly popular among sportsmen who have passed their novitiate on a motor cycle.



Zan Ambrogio an Italian despatch rider, and his Triumph.



A bath used as a boat, with a couple of petrol cans as floats. The photograph was taken within ten miles of the firing line in France, and shows a couple of despatch riders enjoying an hour's relaxation. Corporal Woodroofe, who sends us the particulars on this page, is on the left.

A NEW USE FOR PETROL TINS.

"I AM sending you a photograph taken 'Somewhere in France' by one of our staff officers, who thought it was rather a novelty that we had made a boat out of a bath. To make it more stable we used petrol tins as floats. The photograph was taken ten miles from the firing line. We get lots of runs to the trenches, and get in rather warm areas at times, but I am getting used to the guns now."—From Corporal B. Woodroofe, despatch rider attached to the 19th Div. Sig. Co., R.E.

PROMOTION FOR MOTOR CYCLIST OFFICERS.

WE quote the following extract from *The London Gazette*: Special Reserve of Officers, reserve units Royal Engineers (Motor Cyclist Section). Temporary second-lieutenants to be temporary lieutenants: H. H. Berlandina, C. L. Mason, A. G. Marshall, A. J. Harris, and J. C. Warrington.

A. R. Courtenay (late acting manager of the General Electric Co., Publication Department), who was for three years the secretary of the Tunbridge Wells M.C.C., and two years on the A.C.U. Committee, was gazetted recently sub-lieutenant in the Royal Naval Air Service, Armoured Car Aeroplane Support (Royal Naval Volunteer Reserve).

FITTING A SPEEDOMETER.

By ROAD RIDER.

QUITE half the purchasers of speedometers arrange for the fitting to be done either by the makers of the machine, before delivery (when a fitting fee is often charged), or by the local agent supplying the instrument (when the work is usually done gratis). These methods are advisable when the owner is not fond of tinkering, as the job is often a very fiddly business, and the parts seldom fit with exact accuracy, and even if they are precisely made and designed, some care and skill are essential to get the drive in dead register, so that it will run silently. However, numbers of riders order speedometers as afterthoughts, and live at some distance from a garage, whilst others like to do their own work, and to save professional fees, so the following hints may be of service.

The first difficulty is to get the large gear wheel attached to the front wheel spokes so that it is truly concentric with the hub flange. Various authors have often remarked that perfect centring is best attained with the aid of a lathe, in which to spin the parts, and many an amateur endorses the counsel after numerous failures to get the gear wheel true. It is certainly difficult to mount it truly on the lines pursued by many eager buyers. They attach all the clips, get the screws about finger-tight, and then clump the wheel this way and that with a mallet until it looks approximately central; then they tighten up, and fit the gear box and small pinion. On spinning the bicycle wheel to test the adjustment, the outraged gears utter an intermittent squeal full of alternate crescendos and diminuendos, plainly proving that the gear wheel is running out of truth, and that the teeth are meshed to different depths at different arcs of the circumference. Here is a simple dodge for fitting the wheel in absolute truth without the aid of a lathe, and at the first attempt.

Before commencing to fit any parts at all, take a pair of compasses, and a piece of paper. Inscribe a circle on the paper of the same diameter as the internal circle A B of the large gear wheel. Inside this circle, and with the same centre, inscribe a second circle C D equal in diameter to the hub flange. The clearance between these two circles is the clearance required between the outer edge of the hub flange and the inner edge of the large gear wheel; and this clearance must be equal all the way round. Take any odd bit of hardish wood, and cut its end with a penknife to the exact width of the clearance A C; it will then serve as a fitting gauge.

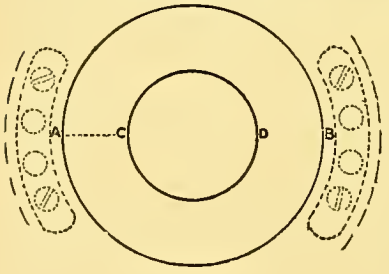


Fig. 1

Fitting the Large Wheel to the Spokes.

Now take the large gear wheel, and commence fitting it. Note the number of screw holes drilled in it —probably twenty; *i.e.*, there are four clips (intended to go on the far side of the wheel spokes); each clip covers four screw holes (giving a choice of positions for the screws, so that any distribution of the spokes may be dodged, if they foul or cover screwholes); and one screwhole is intended to be left vacant between the ends of each clip. Fit one clip, with its two screws, inserting the screws so as to avoid spoke-crossings, which would prevent the clip being slid towards or away from the hub in any future adjustments. Fit a second clip exactly opposite the first; *i.e.*, if the centre of one clip comes at three o'clock on a clockface, fit the second clip with its centre at nine o'clock. Ignore the two remaining clips entirely for the moment. Having made the two clips now in position not more than finger-tight, take the wood gauge and measure the clearance between the inner ring of the large gear wheel, and the hub flange along the two arcs covered by the two clips. If this clearance is right, it will be right all the way round. Having got this correct, which is very easily done, tighten up the screws of these two clips, and then add the other two clips, which can be done in the most matter of fact way, as they cannot possibly disturb the adjustment. The gear wheel will thus be concentric at the first attempt, and the rider may now go ahead with the attachment of the small gear wheel.

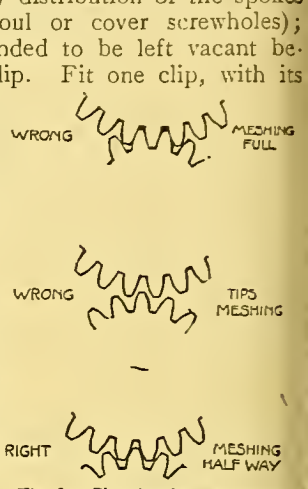

Fig. 2. Showing how the teeth should mesh.

Attaching the Small Wheel.

Whether this job will be easy or not depends on the conscientiousness of the speedometer maker, whose parts are seldom as accurate as they should be, though the cycle manufacturer is often to blame for any errors. There are two points to be watched, namely:

(1.) The depth to which the pinions mesh. If they mesh shallowly, the teeth will rattle; if they mesh deeply, the teeth will grind and bind. Each tooth should mesh about halfway down its corresponding depression in the opposite gear wheel, and the first job is to arrange for this meshing. It may be necessary to file the slots in the bracket carrying the gear box; if so, frequent experiments should be made, for, if the filing is overdone, or if the filed holes are cut out of line, the bolts will

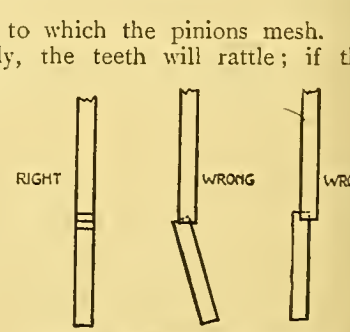

Fig. 3. Elevation end of pinions.

THE MOTOR CYCLE

—and be *sure* of speedy and satisfactory results.

"Must be Hard to Beat."

"I may say your paper as an advertising medium must be hard to beat, as a single advertisement brought me thirteen replies for a free-engine wheel, which I disposed of. You may use this if you desire." HAROLD E. MONTEITH.
12, Gladstone Place, Stirling.

'Sold within half-an-hour."

"I should like to mention that a few weeks ago I advertised a second-hand machine in *The Motor Cycle* and had eighteen enquiries, and sold the motor within half-an-hour of the issue of your paper." F. J. MAW.
47, Skelton Road,
Forest Gate, London.

'A Shoal of Replies."

"One insertion in Miscellaneous column of *The Motor Cycle* brought a shoal of replies, and every article sold. We are unable to answer every one."
BARKER & CO.
Automobile Engineers,
Bradford Road, Huddersfield.

'Could have Sold Gear 40 times over."

"I deeply regret to disappoint Mr. —, but through the advert. (in *The Motor Cycle*) I could have sold gear about forty times over. Several wire money orders received, also cheques."
A. G. GARTON.
140, Porter Street, Hull.

'Each advert. a Great Success."

"I have had several advertisements in your paper, and each has been a great success. A short time ago I advertised an F.N. engine, and as a result spent quite a small fortune returning postal orders. It was sold by wire the day *The Motor Cycle* was published, and about six weeks afterwards I had an enquiry from India. One advertisement in *The Motor Cycle* is worth half-a-dozen in any other paper." JOHN W. WALKER.
Buchlyvie, Stirlingshire.

"Forty Answers."

"I was very pleased with the advert. in your paper, having had about forty answers." (Miss) D. JACKSON.
Fairfield, Birchington, Kent.

There is

THE EVIDENCE
of
ADVERTISERS

¶ This remarkable success of "The Motor Cycle" is attributable to the fact that it has the largest circulation of any paper of its kind and is read by the right sort of people.

"Results of ad. Excellent."

"*Re* my advt. in *The Motor Cycle* of the 10th inst., No. 6839. Although the machine was sold before issue, I received through your paper thirty replies—some of these from York, Derby, Wilts, Hants, Dorset, Sheffield, Cardigan, etc. — and several callers, two of which arrived at the same time, and were willing to bargain. I consider the results of advt. excellent." E. H. COLE.
4, De Castro Terrace, Canterbury.

"Undoubtedly IT."

"A fortnight ago I advertised a sidecar, which I sold the same morning as your paper came out; also a B.S.A. motor cycle, which I sold directly afterwards. I could have sold it five times over again. Your paper is undoubtedly IT." F. MERRIMAN.
"Highbury," Beech Tree Lane,
Cannock, Staffs.

"The Usual Success."

"Following the sale of my B.S.A. combination through the medium of your valuable paper, I advertised a cover and tube, and am pleased to say that the *usual success* was attained, same being sold next morning following day of issue. I was compelled to return several cheques and money orders." F. MERRIMAN.
Beech Tree Lane, Cannock, Staffs.

"Very pleased with result."

"I thought I would like to acquaint you with the success of my advertisement appearing in *The Motor Cycle*.
The same evening I received several calls; the second caller purchased machine at quite a satisfactory figure! You can guess I am very pleased with such a result, and more so as it is the second machine I have sold through your paper with similar dispatch."
EDWIN T. DEACON.
"Falconhurst," Blagdon Road,
New Malden.

Fitting a Speedometer.—

need very heavy tightening to enable them to maintain the adjustment under the strains of driving, particularly when grit and mud get into the teeth.

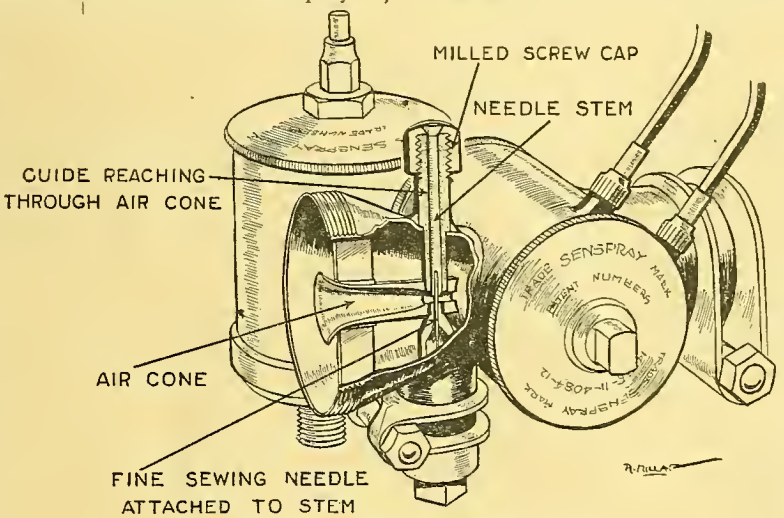
(2.) After the meshing has been set to the correct depth, a silent and practically frictionless drive is assured if the two pinions are set to run in the same vertical plane, which can be verified either by eye from the end-on piston, or by laying a true straight-edge across the flats of both pinions, when the surfaces of both must be in uniform and continuous contact with the ruler. To obtain this result, it may be necessary to bend the bracket or to pack it out by using an oblique washer. As it is an awkward matter to file a washer at any time, and a more awkward matter to file it to a given bevel, it is always best to take a big spanner and bend the bracket plate to the required angle. [Note: the correction of the pinion plane should be made wholly by working from the small pinion on the gear box, after ascertaining that the cycle wheel carrying the large pinion is mounted truly in the forks.]

A Home-made Variable Jet Attachment.

Improving Consumption with Senspray Carburetters.

WE have received several enquiries recently from readers for details of the ingenious variable jet attachment fitted to a Senspray carburetter by "E.A.H.," and described in our issue for April 15th last.

The attachment consists of sundry parts from a tyre valve and a domestic sewing needle. Directly above the jet a hole is drilled in the carburetter body to receive the tyre valve piece, which is soldered vertically in position. The milled cap at the top is soldered to a slender piece of rod which passes down the centre of the valve piece, and the lower extremity of the rod is drilled to receive a fine sewing needle, which passes down into the jet, the orifice of which is regulated by simply screwing the milled valve cap. The needle is raised for starting, and screwed down when a weaker mixture is required, and the jet used is the standard 30.



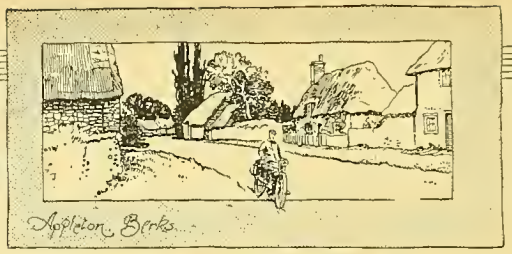
Variable jet attachment for Senspray carburetter.

Several correspondents have stated that this device gives excellent results in economy and amply repays for fitting.

"N.B." in our issue of July 15th, who owns a 1914 pattern two-stroke, asserts that, whereas his consumption with petroil mixture was originally about 60 m.p.g., a consumption of about 120 m.p.g. is possible with the variable needle fitted. Moreover, the engine is said to run more sweetly, from which it is obvious that the mixture must be decidedly improved.

Despatch riders attached to headquarters, Northern Command. Reading from left to right: Lance-Corporal R. F. Walker (B.S.A.), Sergeant B. Whitehead (Sunbeam), Lance-Corporals G. H. Exley and R. S. Gregory (P. and M. and sidecar), R. H. Harlow (B.S.A.), W. H. Bates (B.S.A.), and H Walton (Triumph).

CURRENT CHAT



TIMES TO LIGHT LAMPS.

Sept.	2nd	... ...	7.45 p.m.
,,	4th	... ...	7.41 ,,
,,	6th	... ...	7.37 ,,
,,	8th	... ...	7.32 ,,

In London half an hour earlier.

Mr. W. W. Douglas.

We are glad to hear that Mr. Douglas is now making rapid strides towards recovery. A month ago he met with an accident which injured his eyesight, all the more serious in his case as three or four years ago he completely injured the sight of one eye.

The Rear Lighting Order.

Motorists are complaining that the police regulation which is in force in London and most parts of England, that all vehicles should show a rear red light after dark, is being ignored. Cyclists are the chief offenders, and the police in some districts appear to neglect this road user altogether. Some of the trouble is due to the somewhat loose way in which the regulation has been framed. According to a police official, "The intention was that an extra red lamp should be carried, but the wording permits the use of an ordinary side lamp which shows a red light to the rear, while some cyclists have a combination red and white lamp low down on the front wheel forks with the red light showing to the rear."

Lieutenant F. A. McNab.

The paragraph appearing in our issue of August 26th rather gave the impression that Lieut. F. A. McNab had only just received a commission in the R.N.V.R. This is not the case, as he was granted his commission as sub-lieutenant last November, and has recently been promoted to full lieutenant.

Motor Cycle Trials in Spain.

In the recent International Motor Cycle Trials held in Spain, King Alphonso's cup was won on a 3 h.p. Enfield. The winner's time for 95 km. was 1h. 52m. 31s., giving an average speed of approximately 31½ m.p.h. The rider of a Motosacoche took second place. The course was, we understand, a severe one.

The Munguia Cup Road Race, organised by the Bilbao Sports Club, took place a little later over four circuits, the total distance being 122 km. Result:

1. P. Sorriguietta (3½ h.p. Rudge).
2. L. de Arana (2⅜ h.p. Douglas).
3. I. Znbiaga (3 Enfield).

The winner's time was 2h. 1m. 20s., and average speed nearly 37½ m.p.h. Arana was very successful, and won the Munguia cup for the best performance on formula, the Enderica cup for the 350 c.c. class, the Ibarra cup for fastest lap in the 350 c.c. class, the Serrano medal for fastest lap in the 500 c.c. class, and the Clavileno and Vacuum Oil cups. The time of the fastest circuit was 25m. 28s. for 27 km, just over 39½ m.p.h.

Lieut. Vernon Busby and his latest mount, a Harley-Davidson sidecar outfit. Busby started his military career as a despatch rider, returned from France in the autumn, when he obtained a commission, and supervised the training of despatch riders. He has now been transferred from the Royal Engineers to the Royal Flying Corps.

SPECIAL FEATURES.

IN PEEL-LAND WITH A MOTOR CYCLE.

FITTING A SPEEDOMETER.

COMPLETE ENTRY LIST FOR THE UNITED SERVICES MEETING.

A 200 Miles Trial in Natal.

The Maritzburg M.C.C. at the end of June last held a one day reliability trial over a distance of 206 miles. The roads were fairly good, and the average speed that had to be maintained was 24 m.p.h. This is a high average for Colonial roads, especially when it is considered that the route—a circular one—was hilly. There were sixteen entries, and first three places were secured by the following:

1. T. S. Taylor (6 h.p. A.J.S.).
2. H. B. Morcom (3½ h.p. A.B.C.).
3. L. Hammond (4 h.p. James).

Average Prices.

We give below the average prices for the various second-hand models offered for sale in *The Motor Cycle*. We quote those models of which at least five weekly averages have appeared during the past two months. Where it is possible to obtain a sufficient number of each model we also give the average for the past week:

Make.	Year.	H.P.	Last week's average.	Average for past 8 weeks.
A.J.S.	1914	6 3-sp. sidecar	£79	£73
,,	1913	6 3-sp. sidecar	—	£53
,,	1914	2¾ 3-speed	£48	£43
Ariel	1914	3½ 3-speed	—	£42
,,	1914	3½ 3-sp. sidecar	—	£53

At Brooklands Next Saturday.

The complete list of entries for the United Services race meeting appears on page 235. As the total is 174, it will be seen that there is every promise of the great success attending the All-khaki meeting being repeated.

Flight Lieut. Watson's Douglas.

It will be remembered that Flight-Lieutenant Watson was killed while flying near Eastbourne a short time ago. His motor cycle, a Douglas, No. SR 423, was left at a London garage a few days previously. The proprietor of the garage is asked to communicate with Mrs. Watson, The Retreat, Dundee.

Experienced Car Drivers Wanted.

Drivers are wanted for the A.S.C. Motor Transport. At least two years' driving experience is necessary to qualify candidates for acceptance. The pay is 6s. a day, all found, and the usual separation and dependents' allowance. Vacancies also exist for experienced motor fitters and turners—pay as above stated. Applicants should apply to Captain Kay, Recruiting Office, Coventry, stating qualifications and enclosing two references. Will contemporary journals desirous of repeating these particulars in the national interest refrain from doing so more than two days after the publication of this issue.

The Plague of Eyam.

There are few more delightful spots to be found than Eyam, in Derbyshire, where the plague that wiped out nearly all its inhabitants appeared 250 years ago. The anniversary last Sunday was made the occasion of a great pilgrimage, and nearly 2,000 people listened to Bishop Hoskyn's sermon. The majority came from Sheffield, and as Eyam is inaccessible by rail a great number came by road, there being quite a good selection of motor cycles, especially side-car outfits.

Roads to Avoid.

YORKSHIRE.—The latter part of the road from Scarborough to Whitby. Selby to Doncaster.

WILTS.—Wilton to Shaftesbury. Wilton to Hindon.

Despatch Riders Wanted.

Motor cyclists are wanted for the new squadron Royal Engineers' Signal Service. Intending recruits are asked to apply to the depot of the London Army Troop Signal Company, R.E., 12, Palmer Street, Westminster, S.W.

Admission to Brooklands.

New regulations governing the admission of members and the public to Brooklands have been issued. The latter are now admitted on payment, as before the war, to all parts except the fenced off portion surrounding the barracks on the members' hill and the flying ground. The track is open from 9 a.m. till 6 p.m.

The Proposed Inter-service Hill-climb.

There is every probability that the suggested Navy *v.* Army hill-climb will be carried out by the Streatham and District M.C.C. The A.C.U., while regarding the project sympathetically, will not organise the event, but it is quite willing to grant a permit to a responsible club for the holding of such a competition.

The National War Funds.

At the week-end the principal war funds stood as follow:

	£	s.	d.
The Queen's Work for Women Fund	163,933	3	6
The Weekly Dispatch Tobacco Fund ...	81;790	7	8
Belgian Relief Fund (exceeds)	781,100	0	0
The Indian Soldiers' Fund	146,978	0	0
The Times Fund for the Sick and Wounded ...	1.641.896	11	9

Medal Winners Wanted.

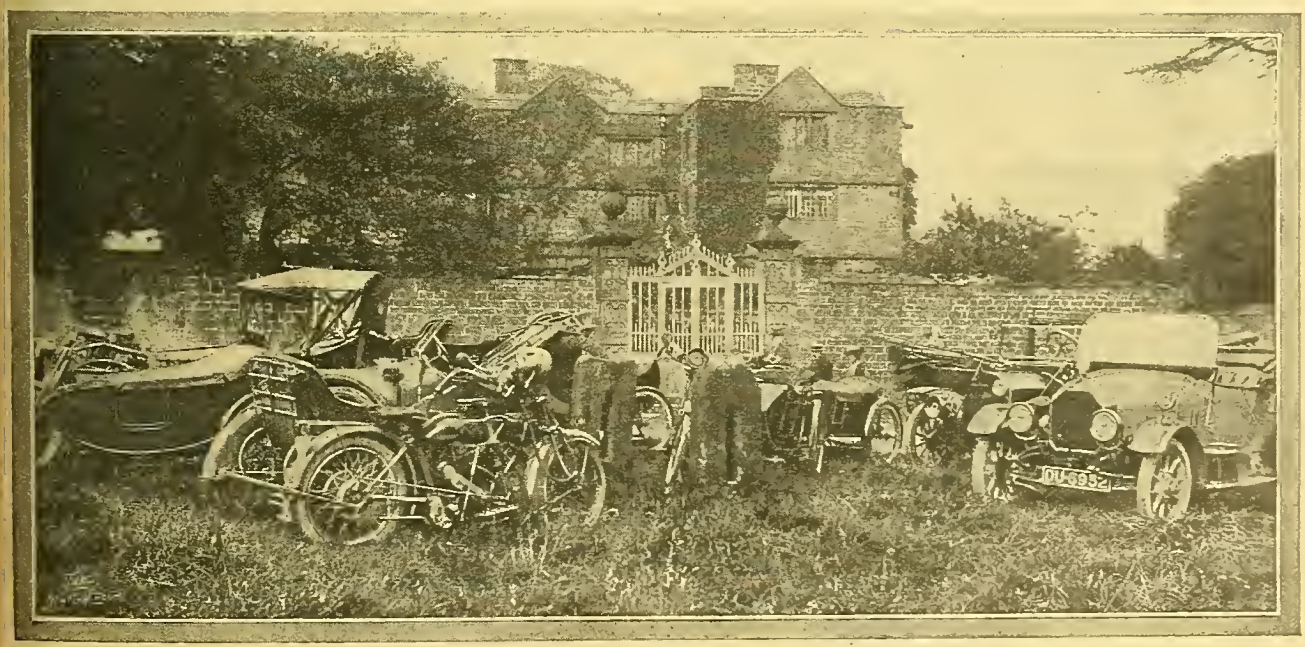
The hon. secretary of the Nottingham and District M.C.C. has a number of medals won in 1914 that cannot be forwarded to the owners, their whereabouts not being known. Winners in Notts trials who have not received their prizes should write to Mr. H. Weldon, Devonshire Road, Sherwood, Nottingham.

'Ware Walsall.

Motor cyclists who have to pass through Walsall (for their sins) are advised to exercise extreme caution. Summonses have been issued for driving at a speed dangerous to the public, and an unfortunate rider was recently fined 40s. for an alleged speed of 21 m.p.h. (his own estimate was 10-11 m.p.h.) The police apparently used separate watches, which they compared at intervals, so it is plain that the possibilities of error in the timing are considerable.

Motor Cyclists' Controlling Bodies Overseas.

It appears that the only Overseas Dominion which possesses a ruling body is South Africa, and in this country the pastime is looked after by the Motor Cycle Union of South Africa. Australia has no such organisation, and as motor cycling is going ahead by leaps and bounds in the Commonwealth, it would appear that both from the point of view of sport and touring, and to help the movement generally, a parental body of some sort is very desirable. The various States have their clubs, also the principal towns in each State, but the huge size of the country has something to do with the non-formation of a controlling body for the whole of the continent. The English Auto Cycle Union would be glad to advise interested Overseas readers who feel that such an institution is needed in the country in which they reside.



Sidecars and light cars outside the old hall at Eyam, Derbyshire. The photograph was taken on Sunday last, when many motorists visited the picturesque village on the occasion of the 250th anniversary of the plague.

Open Hill-climb at Pen-y-Ball.

Another Contest in Aid of the War Charities.

AS already announced in *The Motor Cycle*, the Liverpool Motor Club intends running an open hill-climb in aid of war charities on Saturday, September 18th. The event will be held on Pen-y-Ball Hill, Holywell. The following are the classes:

CLASS 1.—Solo machines up to 250 c.c.
CLASS 2.—Solo machines up to 350 c.c.
CLASS 3.—Solo machines up to 500 c.c.
CLASS 4.—Solo machines up to 750 c.c.
CLASS 5.—Solo machines up to 1,000 c.c.
CLASS 6.—Three-wheeled passenger machines up to 500 c.c.
CLASS 7.—Three-wheeled passenger machines up to 750 c.c.
CLASS 8.—Three-wheeled passenger machines up to 1,000 c.c.
CLASS 9.—Light cars up to 1,500 c.c.

All the events will be decided on time only. There are three prizes in each class. The prizes will consist of War Loan vouchers, and their value will be arranged according to the amount of entrance money received. The entire profits of the hill-climb will be handed over to war charities, and it is not intended to give expensive awards. There will be two distinct sets of prizes in each class, one set for riders defined by the A.C.U. as "General" and one for "Experts." There will also be a special prize for the fastest ascent made by a member of H.M. Forces, and for the fastest time of the day, irrespective of class.

Entries close on September 11th, and they should be addressed to the secretary, Mr. W. H. Bullock, 5, Red Cross Street, Liverpool.

Thirteen Competitors in Irish One Day Trial.

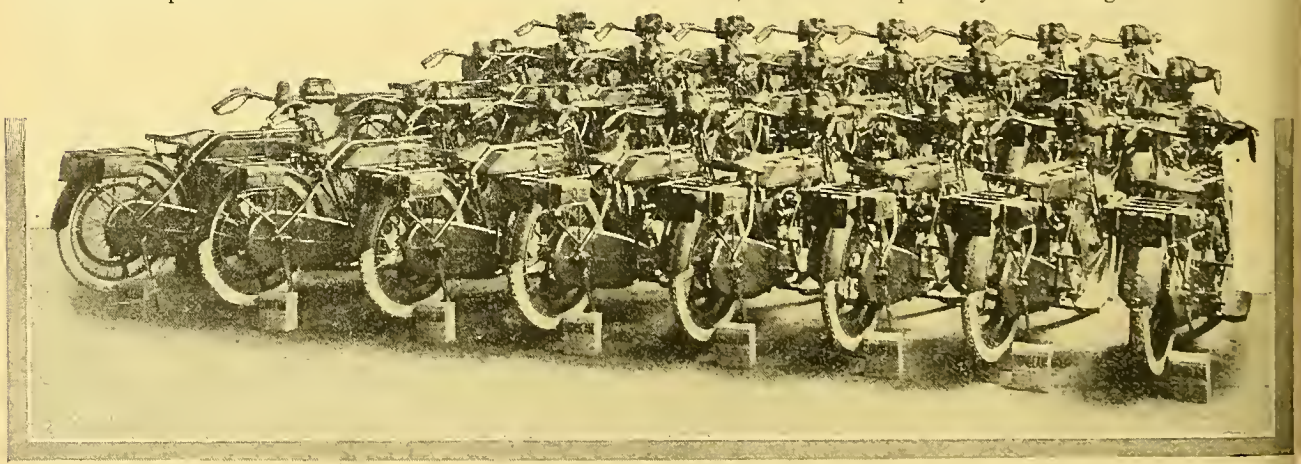
A ONE-DAY trial, under the auspices of the Dublin and District Motor Cycle Club, was held on Saturday last, the route being from Dublin to Newcastle, County Down. It was not a particularly severe affair, as, with the exception of the non-stop section from Kilkeel to Hilltown, the course did not include any country that was calculated to give trouble to the modern machine. The section referred to took the competitors from the coast line of County Down to a point about 1,200 feet above sea level in the Mourne Mountains; but the seven-mile ascent was for the most part nicely graded, albeit of poor surface, and only here and there was there any of it that approached a single figure gradient. The start was from the Tolma Bridge at Drumcondra.

Over the Mourne Mountains.

The ascent from the valley of the Boyne and over Tullyesker Hill was found in splendid condition, and at Dunleer, at the foot of the hill, the first open check was taken. The long hill between Dundalk and Newry gave little trouble, and at the level crossing the second open check was found. Afterwards the route followed the coast line of the County Down by Warrenpoint and Rostrevor to Kilkeel, where the non-stop section over the Mourne mountains was entered upon. The descent from the highest point of the road to Hilltown called for the exercise of great care. From Hilltown an undulating road followed to Bryansford to a descent to the coast at Newcastle, where the trial ended at the Slieve Donard Hotel. The following competitors completed the course, and amongst them should be found a fair number with full marks to qualify for the silver souvenirs offered:

G. Mayne (10 Calthorpe l.c.)
R. W. Stevens (2½ Sun)
G. Curtis (7-9 Indian sc.)
D. Allen (2¼ Sun)
P. H. Hurse (4¼ B.S.A.)
V. J. "Farren" (5 Indian)
W. J. Henderson (7-9 Harley-Davidson sc.)
S. Allen (3½ James)
A. W. Mooney (6 Bradbury sc.)
J. Greene (6 Bradbury sc.)

The non-finishers were: O. S. Baker (10 h.p. Calthorpe light car), stopped near Newcastle with timing gear trouble; T. Woods (4¼ h.p. B.S.A.), stopped after Newry; G. Roche (3½ h.p. Rover), broke belt in non-stop section. Mooney was the only one of the finishers who was not able to report a no-trouble run; he had a stop to adjust his magneto.



Twenty-five 3½ h.p. Sunbeams, a small portion of a large order for the Russian Government. The photograph was taken when the machines were lined up for the Russian inspector. The small boxes by the side of each machine contain spare parts.

Entries for the United Services Meeting.

IT only remains for the good weather to continue to make the United Services Meeting at Brooklands on Saturday quite as successful as its forerunner, the "All-khaki" meeting of a month ago.

Racing starts at 2 p.m., and the last event should be over about 5.30 p.m. As regards admission to the track, the public is now admitted as before the war. Entries, which total 174, are as follow:

EVENT 1.—TWO-STROKE HALF-MILE SPRINT.
Private J. C. Bramwell (Bradfield O.T.C.), Calthope, 245 c.c., 1 cyl.
Flight Sub.-Lieut. G. E. V. Leather (R.N.), 2¾ Triumph.
Flight Sub.-Lieut. R. J. Slade (R.N.), 2½ Villiers.
Lieut. G. G. Barnard (R.E.)
Sergt. A. Milner (R.E.)
1st Class Air Mech. M. Newnham, Radco.

EVENT 2.—LIGHTWEIGHT HALF-MILE SPRINT.
Lieut. G. S. Boston (G.H.Q. Staff), A.J.S., 349 c.c., 1 cyl.
Flight Sub.-Lieut. F. Fowler (R.N.), 2¾ Douglas, 350 c.c.
Lieut F. A. McNab (R.N.V.), Douglas.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas, 350 c.c.
Sergt. A. Milner (R.E.)
Lieut. Miller (R.N.)
C. Remington.
R. E. Tarrant.
P.O. G. H. Kingdon (R.N.A.S.)

EVENT 3.—MEDIUM-WEIGHT HALF-MILE SPRINT.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), 8 J.A.P.
Sub.-Lieut J. Havers (R.N.), Indian, 498 c.c., 2 cyl.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 800 c.c., 2 cyl.
2nd Air Mechanic W. Street (R.F.C.), 3½ Arno, 550 c.c.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas, 350 c.c.
2nd Lieut. M. C. Trench (R.E.), Sunbeam, 499 c.c., 1 cyl.
Corpl. S. Wright (A.S.C., M.T.), Triumph, 550 c.c., 1 cyl.
C. O. Henfrey.
C. F. Mossman.
Sergt. A. Milner (R.E.)
— Saunders.
A. McColl (R.E.)
Lieut. G. G. Barnard (R.E.)
2nd Lieut. H. Guy (R.E.)
S. R. Axford (R.N.A.S.)
Lieut. H. Guy (R.E.), Scott.

EVENT 4.—MEDIUM-WEIGHT HALF-MILE SPRINT FOR RACING MOTOR CYCLES.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), 8 J.A.P.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 500 c.c., 2 cyl.
Private G. Kendall (D.L.O.Y.), 3½ T.T. Norton, 490 c.c.
Lieut. F. A. McNab (R.N.V.), Douglas.
Private G. W. Miller (A.S.C., M.T.), Blackburne, 499 c.c., 1 cyl.
Lieut. J. E. Storey (R.F.C.), T.T. Norton, 499 c.c.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas, 350 c.c.
Corpl. S. Wright (A.S.C., M.T.), Triumph, 550 c.c., 1 cyl.
C. O. Henfrey.
— Saunders.
A. MacColl (R.E.)
Lieut. G. G. Barnard (R.E.)
F. M. C. Houghton.
2nd Lieut. H. Guy (R.E.)
G. W. Huntbach.
P.O. G. H. Kingdon (R.N.A.S.)
S. R. Axford (R.N.A.S.)

EVENT 5.—QUICK-CHANGE PLUG RACE.
Sergt. F. E. Barker (A.S.C., M.T.), Zenith-Jap, 998 c.c., 2 cyl.
2nd Lieut. C. G. Cardew (R.E.), Zenith, 654 c.c., 2 cyl.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), J.A.P.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 800 c.c., 2 cyl.
Asst.-Paymaster C. P. Marcel (R.N.), Indian, 994 c.c., 2 cyl.
Lieut. F. A. McNab (R.N.V.), Douglas.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas, 350 c.c.
Corpl. S. Wright (A.S.C., M.T.), Triumph, 550 c.c., 1 cyl.
Private R. A. Waddy (Oundle O.T.C.), Indian, 994 c.c., 2 cyl.
Cadet R. Charlesworth (O.T.C.), Zenith.
A.M. C. F. Mossman (R.N.A.S.), Zenith, 496 c.c., 2 cyl.
2nd Lieut. C. V. Parr (R.F.C.), Indian, 2 cyl.
Sergt. A. Milner (R.E.), Diamond, 349 c.c., 1 cyl.
Lieut. Miller (R.N.)
2nd Lieut. F. Stockdale (3/1st Cambs Regt.), Indian, 684 c.c., 2 cyl.
2nd Lieut. G. G. Barnard (R.E.), Triumph, 550 c.c., 1 cyl.
2nd Lieut. F. M. C. Houghton (25th Div. Cycl. Co.), Rudge-Multi, 499 c.c., 1 cyl.
Private H. F. Edwards (Artists Rifles) Zenith, 986 c.c.
P.O. G. H. Kingdon (R.N.A.S.)

EVENT 6.—UNLIMITED HALF-MILE SPRINT.
2nd Lieut. W. F. Abbott, (4th East Surrey Regt.), 7-9 Harley-Davidson.
Sergt. F. E. Barker (A.S.C., M.T.), Zenith-Jap, 998 c.c., 2 cyl.
2nd Lieut. A. Boston (11th Suffolks), 7 Indian.
2nd Lieut. C. G. Cardew (R.E.), Zenith, 654 c.c., 2 cyl.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), 8 J.A.P.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 500 c.c., 2 cyl.
Private G. Kendall (D.L.O.Y.), 3½ T.T. Norton, 490 c.c.
Asst.-Paymaster C. P. Marcel (R.N.), Indian, 994 c.c., 2 cyl.
Lieut. F. A. McNab (R.N.V.), 2¾ Douglas, 350 c.c.
2nd Lieut. O. J. F. Scholte (3rd Bedfords), 7 Indian.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas, 350 c.c.
Private R. A. Waddy (Oundle O.T.C.), Indian, 994 c.c., 2 cyl.
Cadet R. Charlesworth (O.T.C.), Zenith.
2nd Lieut. C. V. Parr (R.F.C.), Indian, 2 cyl.

EVENT 6.—(Continued.)
Corpl. P. Davey (R.F.A.), Matchless-Jap.
A. MacColl (R.E.), Matchless.
2nd Lieut. G. G. Barnard (R.E.), Triumph, 550 c.c., 1 cyl.
2nd Lieut. W. H. Boston (11th Suffolks), Indian, 994 c.c., 2 cyl.
1st Class A.C. M. Newnham (R.F.C.), 60.92 c.c., 2 cyl.
2nd Lieut. F. M. C. Houghton (25th Div. Cycl. Co.), Rudge-Multi, 499 c.c., 1 cyl.
2nd Lieut. R. H. Dodd (A.S.C., M.T.), Matchless, 964 c.c.
Private H. F. Edwards (Artists Rifles), Zenith, 986 c.c., 2 cyl.
Capt. G. W. Hunthach (M.M.G.S.), Premier, 499 c.c., 1 cyl.
P.O. G. H. Kingdon (R.N.A.S.)
Flight Sub.-Lieut. L. P. Openshaw (R.N.), Zenith, 986 c.c., 2 cyl.
Private W. J. Read (R.F), Indian, 998 c.c., 2 cyl.
S. R. Axford (R.N.A.S.), Matchless.
C. J. Blumfield (R.E.)

EVENT 7.—SIDECAR HALF-MILE SPRINT.
Sergt. F. E. Barker (A.S.C., M.T.), Zenith-Jap, 998 c.c., 2 cyl.
2nd Lieut. C. G. Cardew (R.E.), Zenith, 654 c.c., 2 cyl.
A. MacColl (R.E.), Matchless.
Private H. F. Edwards (Artists Rifles), Zenith, 986 c.c., 2 cyl.
Flight Sub.-Lieut. O. P. Openshaw (R.N.), Zenith, 986 c.c., 2 cyl.

EVENT 8.—LIGHT CAR HALF-MILE SPRINT.
Sergt. F. E. Barker (A.S.C., M.T.)
— Scott, Singer.

EVENT 9.—SERPENTINE FAST RACE.
Sergt. F. E. Barker (A.S.C., M.T.), Zenith-Jap, 998 c.c., 2 cyl.
Lieut. G. S. Boston (G.H.Q. Staff), A.J.S., 349 c.c., 1 cyl.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), 8 J.A.P.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 500 c.c., 2 cyl.
Asst.-Paymaster C. P. Marcel (R.N.), Indian, 994 c.c., 2 cyl.
Lieut. F. A. McNab (R.N.V.), Douglas, 350 c.c.
2nd Lieut. O. J. F. Scholte (3rd Bedfords), Indian.
Lance-Corpl. T. Thompson (R.E.), Douglas, 350 c.c.
2nd Lieut. M. C. Trench (R.E.), Sunbeam, 499 c.c., 1 cyl.
Corpl. S. Wright (A.S.C., M.T.), Triumph, 550 c.c., 1 cyl.
Cadet R. Charlesworth (O.T.C.), Zenith.
Air Mech. C. F. Mossman (R.N.A.S.), Zenith, 496 c.c., 2 cyl.
2nd Lieut. C. V. Parr (R.F.C.), Indian, 2 cyl.
Sergt. A. Milner (R.E.), Diamond, 349 c.c., 1 cyl.
2nd Lieut. F. H. G. Stockdale (3rd/1st Cambs Regt.), Indian, 684 c.c., 2 cyl.
Angus McColl (R.E.), Sunbeam.
Lieut. G. G. Barnard (R.E.), Triumph, 550 c.c., 1 cyl.
1st Class Air Mech. M. Newnham (R.F.C.), Yale, 60.92 c.c., 2 cyl.
2nd Lieut. F. M. C. Houghton (25th Div. Cycl. Co.), Rudge-Multi, 499 c.c., 1 cyl.
2nd Lieut. R. H. Dodd (A.S.C., M.T.), Matchless, 964 c.c.
2nd Lieut. H. Guy (R.E.), Scott.
P.O. G. H. Kingdon (R.N.A.S.)

EVENT 10.—JUNIOR HILL-CLIMB.
Lieut. G. S. Boston (G.H.Q. Staff), A.J.S., 349 c.c., 1 cyl.
Flight Sub.-Lieut. F. Fowler (R.N.), 2¾ Douglas.
Flight Sub.-Lieut. G. E. V. Leather (R.N.), 2¾ Triumph.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas.
Sergt. A. Milner (R.E.), Diamond, 198 c.c., 1 cyl.
Lieut. Miller (R.N.)
P.O. C. Remington (R.N.A.S.), Douglas, 350 c.c.
P.O. G. H. Kingdon (R.N.A.S.)

EVENT 11.—MEDIUM-WEIGHT HILL-CLIMB.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), J.A.P.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 500 c.c., 2 cyl.
Private G. Kendall (D.L.O.Y.), 3½ T.T. Norton, 490 c.c.
Lieut. F. A. McNab (R.N.V.), Douglas.
Private G. W. Miller (A.S.C., M.T.), Blackburne, 499 c.c., 1 cyl.
Lieut. J. E. Storey (R.F.C.), T.T. Norton, 490 c.c.
Lance-Corpl. T. Thompson (R.E.), 2¾ Douglas.
2nd Lieut. M. C. Trench (R.E.), Sunbeam, 499 c.c., 1 cyl.
Corpl. S. Wright (A.S.C., M.T.), Triumph, 550 c.c., 1 cyl.
2nd Lieut. C. O. Henfrey (A.S.C., M.T.), J.H. twin, 496 c.c.
— Saunders, Norton.
Lieut. G. G. Barnard (R.E.), Triumph, 550 c.c., 1 cyl.
2nd Lieut. F. M. C. Houghton (25th Div. Cycl. Co.), Rudge-Multi, 499 c.c., 1 cyl.
Capt. G. W. Huntbach (M.M.G.S.), Premier, 499 c.c., 1 cyl.
S. R. Axford (R.N.A.S.), Matchless, 498 c.c., 2 cyl.
A. MacColl (R.E.), 3½ Sunbeam.

EVENT 12.—UNLIMITED HILL-CLIMB.
Sergt. F. E. Barker (A.S.C., M.T.), Zenith-Jap, 998 c.c., 2 cyl.
2nd Lieut. C. G. Cardew (R.E.), Zenith, 654 c.c., 2 cyl.
2nd Lieut. R. Scrase Dickins (K.R.R.C.), 8 J.A.P.
Corpl. H. Graham Hodgson (R.E.), A.B.C., 500 c.c., 2 cyl.
Private G. Kendall (D.L.O.Y.), T.T. Norton, 490 c.c.
Asst.-Paymaster C. P. Marcel (R.N.), Indian, 994 c.c., 2 cyl.
Lieut. F. A. McNab (R.N.V.), Douglas.
2nd Lieut. O. J. F. Scholte (3rd Bedfords), 7 Indian.
Lance-Corpl. T. Thompson (R.E.), Douglas.
Private R. A. Waddy (Oundle O.T.C.), Indian, 994 c.c., 2 cyl.
Corpl. S. Wright (A.S.C., M.T.), Triumph, 550 c.c., 1 cyl.
Cadet R. Charlesworth (O.T.C.), Zenith.
2nd Lieut. C. V. Parr (R.F.C., R.B.), Indian, 684 c.c., 2 cyl.
Corpl. P. Davey (R.F.A.), Matchless.
2nd Lieut. F. H. G. Stockdale (3rd/1st Cambs Regt.), Indian, 684 c.c., 2 cyl.
Lieut. G. G. Barnard (R.E.), Triumph, 550 c.c., 1 cyl.
2nd Lieut. W. H. Boston (11th Suffolks), Indian, 994 c.c., 2 cyl.

A Novel Sidecar Hood and Windscreen.

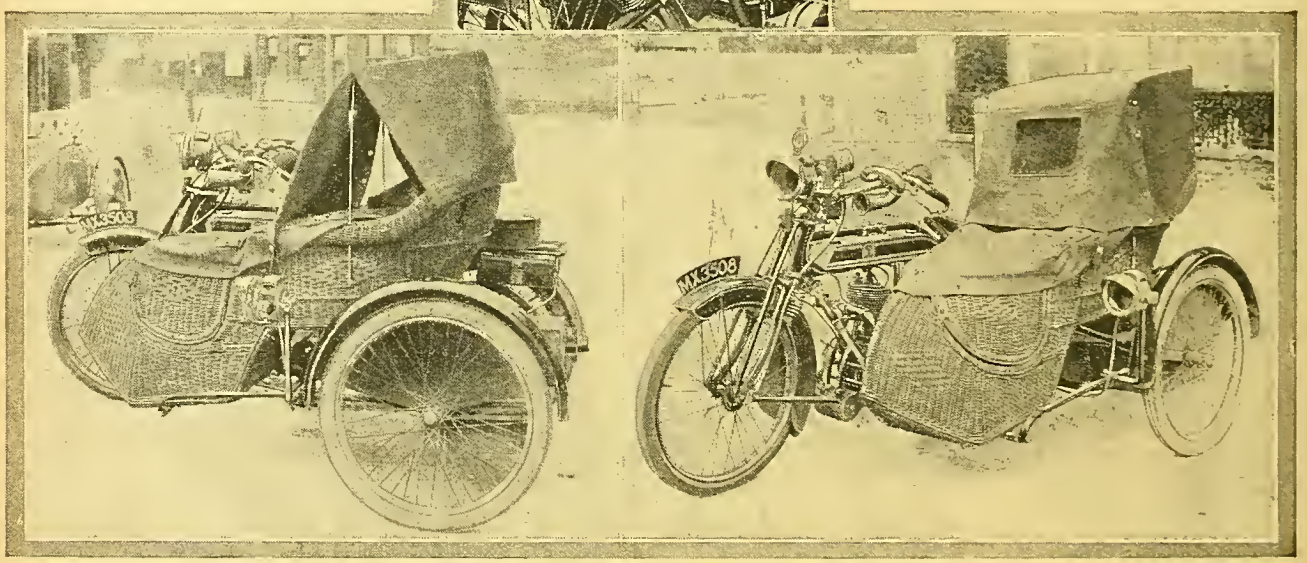
AN ingenious sidecar hood has been made by Mr. W. E. Boyce, 275, Archway Road, Highgate, N., and we are enabled to illustrate and describe it. The first photograph shows the hood folded up in its case, together with a small separate case containing the necessary sticks and stays. From the time Mr. Boyce, in giving us a demonstration, began to unpack the hood and its appurtenances from their cases until the device assumed the position shown in the third illustration, only 2m. 9s. passed.

The hood consists of one piece of material, suitably stayed by metal rods, and by long semi-circular pieces of cane, which allows it to assume the necessary curved position in front. Behind is a series of holes giving an adequate degree of ventilation. It will be noticed that the front is provided with a talc window, while the sides are secured by means of glove button fasteners. The second illustration shows the hood with the ends tucked in, a position which may be assumed when the rain is not very severe and more air is desired.

Weight and Space.

It only weighs 4½ lb., and when folded up occupies but little space. The actual hood portion, not including the sticks, can be carried underneath the cushion.

When ordering Boyce's patent hood and screen it is necessary to state the make of sidecar, whether it is cane or coachbuilt, the height from the back of seat to the top of back, height from front of seat to the top of sides, length of seat, and outside width across body. The passenger's height from the seat to the top of the head should also be stated.



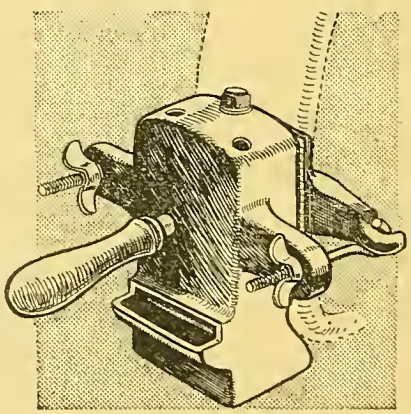
(Top) Hood and stick folded up in their respective cases, and sidecar equipped with apron.
(Left) Hood in position, with flaps folded back.
(Right) Sidecar passenger completely covered in and ready to defy the worst elements.

THE MARVEL STEAM VULCANISER.

AN ingenious and simple steam vulcaniser, known as the Marvel, has lately been placed on the market by Messrs. H. Taylor and Co., 21a, Store Street, W.C.

The vulcaniser consists of a casting which is hermetically sealed, and contains a certain quantity of water. The bottom portion forms the spirit lamp, which consists of absorbent wool covered with wire gauze. To start the vulcaniser, it is only necessary to pour a measure of spirit through the orifice leading to the gauze.

To repair a puncture in the inner tube, the place is roughened with sand paper, and thoroughly cleaned with petrol. A special cement is applied in the same manner as ordinary tyre solution. A piece of repair rubber the size of the puncture is then placed over the hole, and then another piece extending half an inch over the first piece. In the case of a large cut a piece of paper should be placed on the inside of the tube, so that the sides do not stick together. To vulcanise the repair, place a piece of paper as large as the machine over the patch, and fix the inner tube on to the vulcanising plate. The plate is then firmly screwed to the machine. For inner tubes, less than a full measure of methylated spirit or petrol may be used. The repair will be accomplished in about fifteen or twenty minutes after the spirit has been lighted. Cuts in outer covers may also be successfully repaired.



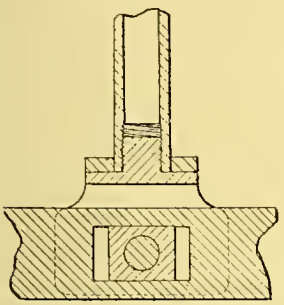
The Marvel vulcaniser

Another reason, beside that of bad city roads, why motorists should avoid Oxford has now been brought to our notice. Police traps are in operation about one mile outside the city on the Botley, Woodstock, Banbury, and Iffley roads.

A NOVEL SPRING FRAME.

THE spring frame illustrated is the invention of M. Van Geert, 59, Beaufort Road, Birmingham, and has many interesting features.

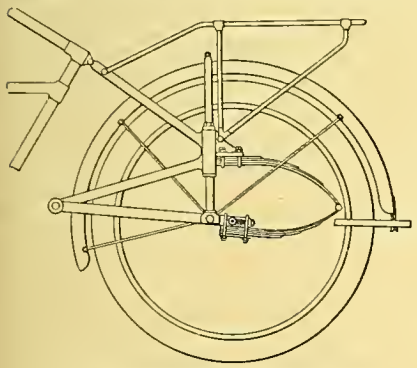
One end of the chain stays is pivoted, while the other carries a sliding fork, which embraces the mudguard. The guide for the fork forms a lug for the two rear frame members, and also a bracket for one side of the spring, the chain stays carrying the other side. It may be noted that it is not essential to use the kind of spring illustrated.



Section showing the manner in which the fork is attached to the hinged chain stay.

On referring to the sectional drawing, it will be seen that there is a slot in the chain stays, which allows the fork end to slide in a horizontal direction. The mudguard is secured at the top by an ordinary pin, and the removal of a single nut leaves it free to swivel round the wheel, thereby uncovering a large portion of the tyre to facilitate repairs.

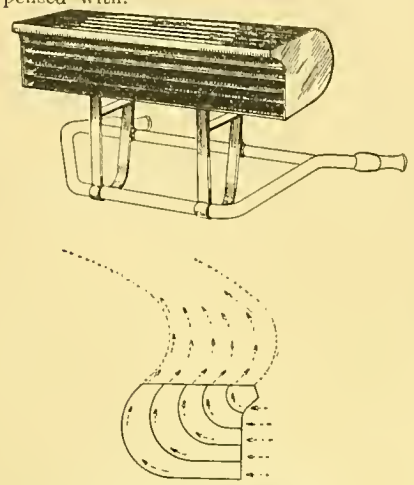
The inventor informs us that he has tested the frame on the road in Flanders for a considerable time, with excellent results.



The Van Geert patented system of rear suspension.

AN AIR DEFLECTOR FOR THE HANDLE-BARS.

AN interesting accessory hailing from America is the Van Zile air deflector. It is a device intended to shield the motor cyclist from wind and dust, and is attached to the handle-bar by means of a metal bracket, which has a vertical adjustment of three inches. It is constructed of curved metal vanes, which are secured to side plates, and the wind entering the front of the apparatus is deflected upwards away from the rider at an angle of 45°. Consequently, air currents coming along above the deflector are forced in an inclined direction over the rider's head. Dust, it is claimed, is treated in the same manner, goggles thereby being dispensed with.

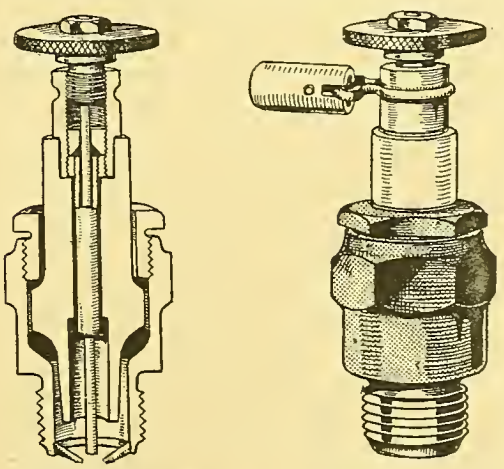


The Van Zile air deflector.

The Van Zile deflector may also be fitted to a sidecar in the place of a wind screen. It is stated that a pipe or cigarette may be lighted in the sidecar quite easily while travelling at fairly high speeds. The weight is nine pounds. Although few English riders would care to have this weight on the handle-bars, it would not be objected to in the United States, where machines are much heavier than those of British manufacture, nor is it a disadvantage on the front of a sidecar body where a glass screen is often supported.

NEW DESIGN SPARKING PLUG.

AN interesting design of sparking plug providing adjustable points has been submitted to us by the patentee, Mr. J. A. Kennedy McGregor, 124, Mere Road, Erdington. It will be noticed from the section here-with that a vertical adjustment of the central electrode is provided, adjustment of the points being possible while the engine is running, by means of the fibre disc at the top of the plug. We have not yet tested the benefits to be derived from the plug in question, but it is a well-known fact among experienced riders that the distance between the points of the plug has a great bearing upon the running of the engine, and Mr. McGregor tells us that during his tests it has been easily possible to note the varying effect on the speed of the engine by opening and closing the points. The plug is known as the "Gorson," and it should appeal particularly to owners of twin-cylinder machines, as by closing the points of each plug in turn the cylinders may be tested separately until the best results are obtained. Mr. McGregor claims that there is no fear of any compression leakage in the plug owing to the special stuffing box and asbestos packing provided. The price of the plug is 5s., including a patent terminal consisting of a spring clip which may readily be detached by pressing the sides. When in use the clip is covered with rubber, not shown in the illustration.



The Gorson sparking plug, the special feature of which is its adjustable point.

A NEW PUNCTURE-PROOF TYRE FILLING.

A TYRE filling which has been satisfactorily used for some years in America, known as Essenkay, is now being introduced into this country by Messrs. Essenkay, Ltd., of Southgate Street, Leicester. Essenkay is a light elastic substance, similar in appearance to porous rubber, though no rubber is used in its manufacture. It is made in sections of about 2ft. in length, and covered with a fabric casing. It is fitted into the tyre after the tube has been removed; the cover is replaced by means of a special tool, which forces it into place, so that the filling is under pressure.

Essenkay should prove very useful for the rear wheel of tradesmen's side carriers, etc., where tyre reliability is essential while speed and efficiency are not so important. Unfortunately, at present it is not possible to fit it to tyres of less than 3in. section.

We are informed that the life of tyres filled in this manner is increased by at least 100%. When the cover is worn out the Essenkay can be fitted to the new tyre just as satisfactorily. We understand it is better to fill a new cover rather than one partially worn.

A trial run on the carrier of a powerful twin and sidecar with the driving wheel filled proved this air substitute to be quite resilient, while the speed and power seemed very little affected, as during our test a speed of 40 m.p.h. was attained; and at this speed the machine was not unduly uncomfortable in spite of there being only a small cushion on the carrier. Although this outfit had done over 1,000 miles there was no sign of loose or broken spokes, which goes to show that little extra vibration is caused.

Races and Trials in Union and Dominion.

CAPE PENINSULA M.C.C. 112 MILES TRIAL.

COMPETITORS in the Garlick and Enfield Cup reliability trials which were held concurrently over the same course and under practically the same conditions on the King's birthday found the roads in far better condition than anticipated, and once more the sun shone in all its brightness on the scene at the Salt River start, when A. Manchip led off punctually at 9 a.m. All the competitors rode Enfield sidecar outfits, with the exception of A. E. Robinson, whose mount was a 5 h.p. Indian and sidecar.

Turning into the Koeberg Road, the route led past Potsdam and the old Dutch farm, Vissershok (once belonging to Governor van der Stel), and up a steep hill. Here the riders encountered a heavy bank of fog, the top of the hill, however, being bathed in sunshine. On descending they once more cut through the thick mist, travelling down the hill towards the Durbanville Valley, when they met officials of the secret control.

The good villagers had turned out *en masse* to see the men on their runs over the leafy five-mile road which leads to Belville.

The watersplash at Sir Lowry Pass being fairly deep, and with a soft bottom, caused A. Manchip's machine to stop; consequently, rider and passenger jumped in the river and pushed the outfit on to safer ground.

After lunch the journey was continued through Stellenbosch town, up the dreaded Hel's Hoogte (Hell's Height), and over the shocking roads past the village of Pniel.

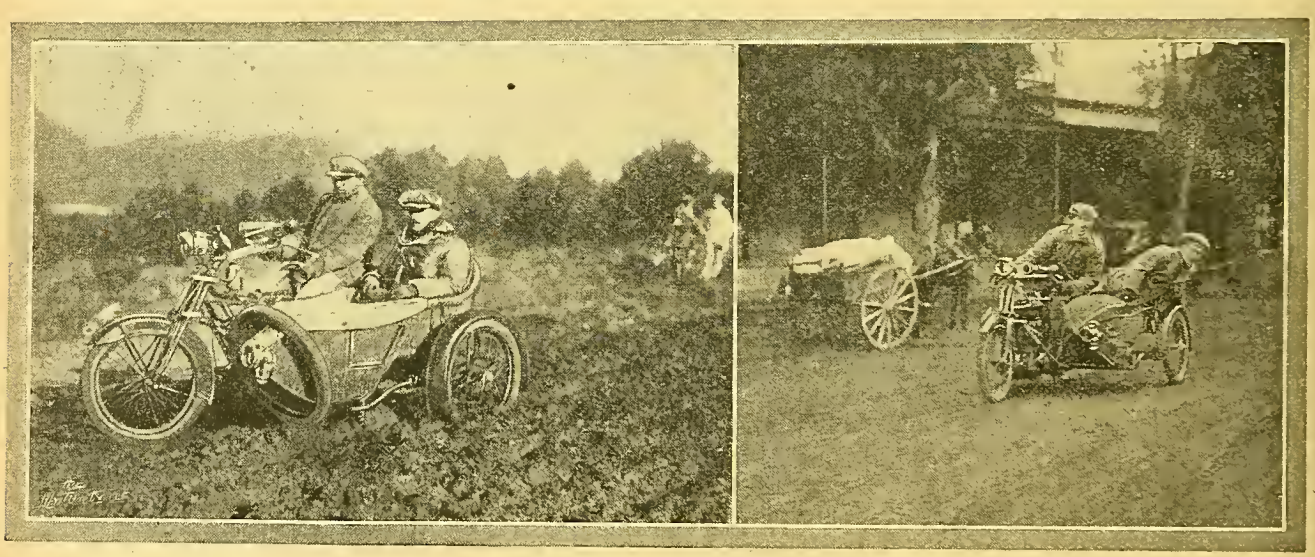
The descent of Hel's Hoogt—in parts through mud—proved trying work, especially when the village of Pniel, with its terrible roads, was reached. After the negotiation of many minor watersplashes and the subsequent crossing of the railway line, Klapmuts and the main road to Capetown were regained. Results:

GARLICK CUP.

		Marks lost.
1.	A. Moralee	0
2.	J. G. Elliott	3
3.	A. Manchip	20

ENFIELD CUP.

		Marks lost.
1.	A. Moralee	0
2.	R. Pike	2
3.	J. G. Elliott	3



Good and bad roads encountered by competitors in the Cape Peninsula M.C.C. reliability trial described on this page. (Left) B. Walsh negotiating a good sample of Colonial mud. (Right) A. Moralee, the winner, taking a bend. Both riders are using Enfield sidecar outfits.

DOINGS IN NEW ZEALAND.

JUNE saw the end of the motor cycle competition season in New Zealand, with the exception of a race meeting held by the South Canterbury M.C.C. on June 10th. The results of this and one or two other gatherings are given hereunder.

South Canterbury M.C.C. Washdyke Races.

TWO LAP SCRATCH RACE, 350 c.c.—1, A. Woodham (2¾ Douglas); 2, R. Marshall (2¾ A.J.S.); 3, P. A. Foden (2¾ Douglas). Time, 3m. 19s.

THREE LAP SCRATCH RACE, 350-550 c.c.—1, F. Baker (3½ Triumph); 2, A. E. Dendy (3½ B.S.A.); 3, H. McNight (3½ Rudge). Time, 7m. 12⅕s.

THREE LAP HANDICAP, 350 c.c. CLASS.—1, R. Marshall (2¾ A.J.S.); 2, S. Hatton (2¾ Douglas); 3, A. Woodham (2¾ Douglas). Time, 4m. 36s.

FIVE LAP HANDICAP, OPEN, for the Cowan Cup.—1, F. Baker (3½ Triumph), 30s. start; 2, H. McNight (3½ Rudge), 55s.; 3, C. Evans (4 Triumph), 70s. Time, 6m. 29⅕s.

FIVE LAP HANDICAP, 350-550 c.c.—1, C. Evans (4 Triumph), 60s start; 2, H. McNight (3½ Rudge), 35s.; 3, F. Baker (3½ Triumph), scratch. Time, 7m. 24⅖s

Hawkes Bay Club Reliability Trial.

The Hawkes Bay Club held its annual reliability trial recently from Hastings to Tikokino and return. There were twenty competitors, and nineteen finished, despite severe conditions.

The winner of the event was Sutton (3½ Humber), who, therefore, holds the Triumph Cup for the succeeding year.

Pioneer Motor and Sports Club.

The Pioneer Motor and Sports Club (Christchurch) held a smoking concert on June 12th, when the distribution of prizes won during the season was made. Several of the donors of special prizes announced their intention of donating further trophies for the coming season. There were thirteen events conducted during the season, and all were successful. The results of all these meetings and trials have appeared in *The Motor Cycle*.

Wanganui Motor Cycle Club.

The Wanganui Motor Cycle Club's eight-hour reliability trial, held on June 3rd, resulted as follows: 1, A. B. Collins (3½ Triumph); 2, H. H. Smith (2¾ Douglas).

Does an Engine run better at Dusk?

Concluding Instalment—Some Interesting Theories.

THIS old topic has brought us so many interesting letters that we feel constrained to publish a further, but final, selection. Of course, the larger the amount of oxygen that can be got into the cylinder the more forcible will be the explosion. Moisture, too, should have some effect in the matter of cooling (a Martini rifle always shot better on a wet day, but perhaps the cases are hardly analogous). We must confess that the ozone theory propounded by one of our correspondents is new to us.

Sir,—With reference to the discussion on the question of whether petrol motors run better at dusk, and if so, why? In the first place, the simple question of fact, there does not appear to be room for argument. Any experienced motorist will tell you that they *do* run better towards evening, whether they have been used previously during the day or not. With reference, however, to the reason for this phenomenon, may I suggest a theory which I have held for some years, and which I think is at all events as tenable as any of those already put forward? It is briefly this: In the first place, it is well known that light has a peculiar action on many substances—in particular, on certain unstable or polymorphous elements, causing them to assume a different molecular distribution of the atoms. As, for instance, the unstable flexible form of sulphur, which rapidly assumes the usual hard crystalline form when exposed to the action of light.

Now, the oxygen of the atmosphere is known to be capable of assuming another form, namely ozone, which is still oxygen, but in which the molecules consist of three atoms instead of two. This form is known to be less stable than the usual one, and, consequently, will more readily enter into combination with other substances—petrol vapour, for instance. Further, it is known that ordinary oxygen can be converted into ozone by the passage of an electric spark. Why not, therefore, by the prolonged action of sunlight?

Thus, my theory is this: That at the end of the day there exists a greater proportion of the atmospheric oxygen in the form of ozone than at the beginning of the day, much of that which has been converted into ozone by the action of light during the day reverting back to its original state during the night, and that, consequently, combustion is more readily obtained at dusk than at any other time. That it has no connection with temperature is obvious, as otherwise there would be an appalling difference between the running of a motor in summer and in winter. F. C. LYTH, M.B.

Sir,—Referring to the question "Does a motor cycle run better at dusk?" I think this peculiarity may be coupled with a similar peculiarity in wireless telegraphy.

It is an accepted theory that immediately after sunset the molecules composing the ether (being in themselves minute magnets, each consisting of a north and south pole) increase their magnetism owing to the absence of the sun's rays, which weakens them; the consequence is the range of communication is greatly increased after sunset.

During the absence of the sun's rays the magnetic field of the magneto would be influenced by the strengthening of the magnets composing the ether. This would give rise to a considerably hotter spark through increased voltage.

Allowing the above theory to be correct, a motor cycle should increase its speed on a thundery day, when the air is overcharged with electricity. This is a suggestion from W. E. G. MARSHALL.

Sir,—I have felt considerable interest in the correspondence on this topic recently revived in your columns, mingled with some pity for the unfortunate people so lacking in a sense of humour that they cannot recognise and appreciate the gentle art of "taking a rise" out of anybody.

It may not be generally known to the motor cycling community at large that on high-powered oil engines used for driving launches, tugs, yachts, etc. (I have the Gardner oil engine in mind), it is customary at heavy loads to introduce a water drip-feed which allows a small quantity of water to enter at the top of the cylinder at each suction stroke. This flashes into steam, deadens the heavy thud of the explosion, and helps to do work by expansion.

I am of opinion that something of the same sort of thing occurs when riding at dusk. At this time the cooling air is charged with moisture ready for condensing, which it does in the form of dew, especially on a spot like the intake of the carburetter, where it can be readily sucked into the cylinder. Personally, I have frequently found my carburetter and the connecting pipe smothered in beads of moisture on returning home.

Some people may object that it is colder in the morning, and the same results ought to obtain. It may be colder, certainly, but the air is not so moist owing to the condensing process having continued all night, leaving a smaller percentage of dampness in the air. If the result is as I suggest, it would account for the extra silky feeling of the engine, and the defective light would cause the impression of increased speed.

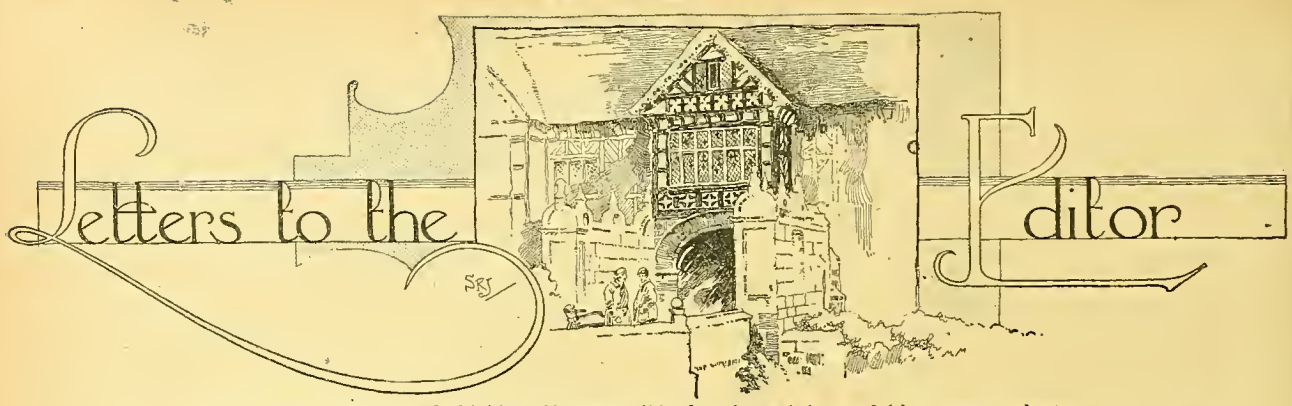
My opinion coincides with that of the writer referred to by Mr. C. M. Stuart, whose engine ran better in mist. I know a man who gets more power and smoother driving on a pouring wet day. Carbonic acid gas has, of course, no effect upon the engine, unless it may be to weaken the mixture and cause slow burning instead of a sharp explosion.

"G.P.G.K." need not get huffy at having his leg pulled. I am sure all motor cyclists will understand and sympathise with him in his thirst for knowledge; let him rather join with the rest of us in thanking Mr. G. Pinker and "Y 2895" for pouring forth the vials of their wisdom and, incidentally, amusing us. The same remarks apply to "Biscuits" and "G.W.P." in a way, although the amusement is different, for their kind remarks on natural, elementary, geographical, and perhaps supernatural science.

LM 2525.

Sir,—I have just perused a copy of *The Motor Cycle*, which I have sent out to me every week. I was both highly amused and interested to read the replies sent by readers in reply to the question "Does an engine run better at dusk?" In my opinion it does. My reasons for thinking so are as follow: At dusk the trees, plants, etc., give off a large quantity of oxygen. Although it will not burn by itself, oxygen is one of the greatest supporters of combustion. This can be proved by the following simple experiment: Take a bottle, turn its neck downwards, and fill it with oxygen from a cylinder, as used with a limelight lantern. Next take a thin piece of wood and ignite it, then wait until the actual flame goes out, and the wood assumes a red glow; then push the smouldering end of the wood up into the bottle, when it will immediately burst into flame again. Now this proves my statement that "oxygen supports combustion." Consequently, at night, the air drawn in through the carburetter has far better combustible properties than during the day. Furthermore, the air is cooler at night; therefore it is denser. So, although the same "volume" is drawn in, it is far heavier. Summarised, it is as follows: During the day an engine draws in a small amount of "weak" air, whilst at night the same engine draws in a greater quantity of rich air. Of course, I gladly throw this letter open to the severest criticism; in fact, I should be far more amused than offended if any other reader could prove where I am wrong, as a *correct* solution of this question would be greatly beneficial to the sport in general. J. E. MITCHELL, M.T., A.S.C., B.E.F.

Sir,—*Re* the correspondence in your journal as to whether an engine runs better at dusk. All practical motor cyclists will agree that an engine does run considerably better and with far greater ease in the dusk. Being a motor cyclist of over eleven years' experience, I first noticed the above about eight years ago, and endeavoured to assign reasons for it. After rejecting many theories I believe I have discovered the reason for it, and, if possible, I hope in the near future to patent a carburetter that will give to the engine the same conditions that are usual at dusk, and so ensure the ideal running which is so obvious when dusk sets in. F.C.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

An American Lightweight.

Sir,—The new American two-stroke which you described last week certainly does bear a strong resemblance to a well-known Coventry machine, and I take it that this machine is the two-stroke Triumph. Has it struck you or any of your readers that the American machine also bears a still stronger resemblance to a well-known Belgian make, namely, the F.N.? In fact, as I turned the page when looking through your paper and came upon the illustration of this new machine, I thought for the moment that it *was* an F.N. until I looked more closely. The position of the magneto, the appearance of the engine, and also the design of the frame (bar the front forks) all strike me as being extremely similar to the Belgian motor cycle.

ANTHONY T. PRAGA.

Motor Cycle Volunteers.

Sir,—I have followed with considerable interest the correspondence in your columns *re* the various Motor Cycle Volunteer Corps. I do not wish to discourage any of the members, but they might be interested to know that they are invariably referred to here as "The Cheap Glory Brigade." We are told that members must have an excuse for not joining the regulars, yet we are given figures showing the number of members who have joined the Colours.

H. BROCKBANK.

B.E.F., France.

Sir,—I crave your kind indulgence to add a few words to the correspondence that has already appeared on this subject.

It is quite evident that the only information your correspondent Lieut. M. B. has as to the training of the Midland Motor Volunteer Corps is derived from the motor cycle press, and if this has created a misapprehension in his mind, it is a pity that he did not obtain more information before forming views which are totally opposed to the actual facts.

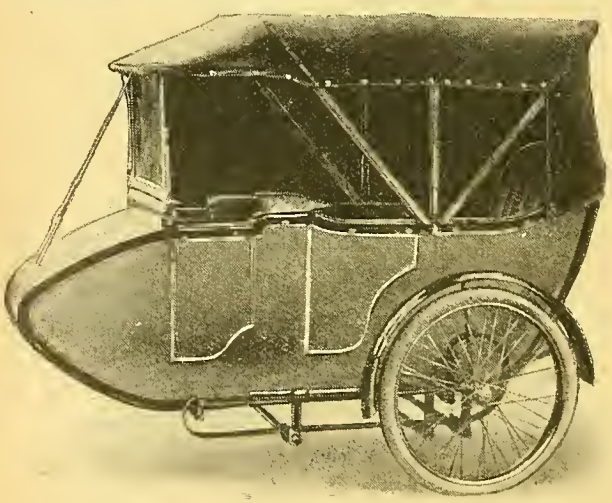
The training of the corps is carried out under military discipline, and it is just possible that even Lieut. M. B. could pick up some useful knowledge were he to attend a field day or lecture.

I wish to say most emphatically that your correspondent is incorrect in saying that the corps is being used by men to evade military duty. The names of the men associated with the administration should be sufficient to guarantee the impossibility of such a thing.

The sore point with Lieut. M.B. seems to be about some occurrence amongst some members at the Style Cop hill-climb. This charge is so childish that it hardly deserves a sportsman's notice! Did "M.B." attend the Khaki Meeting? Did he sit in a corner and weep all day? Did all there wear long faces? Was there no fraternity and no play?

In conclusion, may I remind Lieut. M. B., with all courtesy, that ridicule and sarcasm never make good arguments.

N. RANDOLPH,
Hon. Sec. M.M.C.V.C.



A weatherproof double-seated sidecar built by Stokes and Holt, Ltd., of Leicester. It has been the aim of the designer to make it roomy and comfortable for both riders. The model illustrated is complete with hood, screen, and side curtains.

Boycotting German Motor Cycles and Accessories.

Sir,—Letters on this subject appeared in your journal during May and June, and I think after, but I cannot turn them up, having sent the numbers to a D.R. at the Front. So far as I remember, the only objection of a practical nature was from a manufacturer, who asked how he was to get a certain tool elsewhere than from Germany, unless from the U.S.A., in which case he would have to pay three times as much for it. One must look facts in the face, and admit that the proposed boycott may possibly for a time raise the cost to some small degree of motor cycling goods. On the other hand, let us consider if cheaper goods are not costing more than appears on the surface, if they are only to be obtained by co-operating with as murderous and unscrupulous a nation as ever defiled the earth, whose violations of warfare and of the usages of civilisation brand them as the very Canaanites of the modern world. Let that manufacturer get his tool from America or somewhere else than from such a tainted source, and let him—as he assuredly will—transfer the increased charge to his customers; they will, one would imagine, shoulder the burden if not willingly at least resignedly.

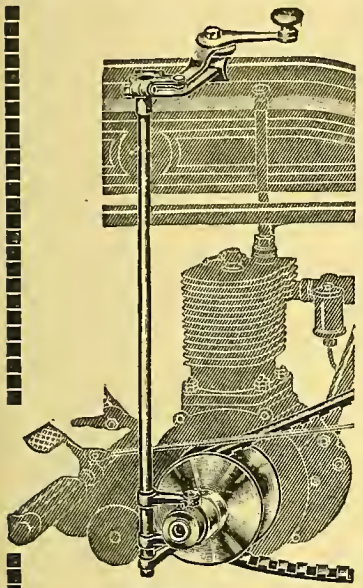
Many readers of *The Motor Cycle* must have perused with shame and amazement the letter from a firm of British magneto makers published in your correspondence columns, observing that certain makers had openly avowed their intention of resuming German magnetos when the war had ended. These men ought to be shunned as the pariahs of the motor cycling trade. One can only hope against hope that the British firm had been misinformed. My means are not large, but I would rather give up my motor cycling than knowingly handle another German accessory or machine, unless paid for by the seller before the commencement of the war, and this is surely the attitude of mind of the vast majority of your readers.

I trust that satisfactory measures may be forthcoming to establish the boycott on such lines as may be effective and permanent.

DELTA.

The GRADO Multi-Pulley

is just the thing, gives gear for 4-1—8-1, Lightweight 10-1.



Motor Cyclist! Read what it will do for you.

This is no boast. It starts your machine like a car.

Takes machine and sidecar up hills impossible without.

Gets you safely through thick traffic.

Ensures safety over the greasiest roads.

In fact, it turns work into pleasure.

Just half a turn of the handle on the top tube changes from top gear to free engine. So Simple!

Read what a Police Constable says:

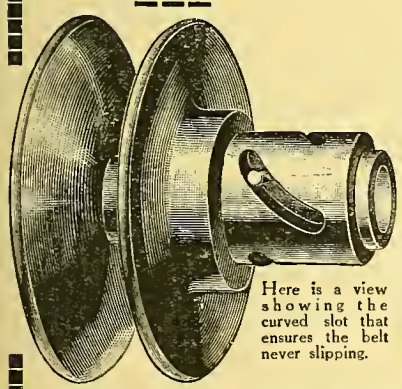
Police Station, Broughton,
Kettering, Aug. 16th, 1915.

Gentlemen,

I received the Grado Multi-Pulley mid-day Saturday last. Thanks for your prompt attention to my order. I fitted same and tried it same evening, and am delighted with it, it acts splendidly to every move of the control lever, and there is not the slightest slip with the belt. The fitting is quite simple. Once more thanking you,

I remain, yours faithfully,

Constable H. SWIFT.



Here is a view showing the curved slot that ensures the belt never slipping.

Fitted in two hours to Triumphs, B.S.A., Bradbury Premier, T.D.C., Rex, Singer, Precision, and others.

Fit one to-day, you are sure to be pleased.

Prices: For Triumph, B.S.A., etc., **£3 3s.**
Lightweights, **£2 10s.**
Recessed for J.A.P., old Rex, etc., 10/- extra.

Write for Catalogue to-day.

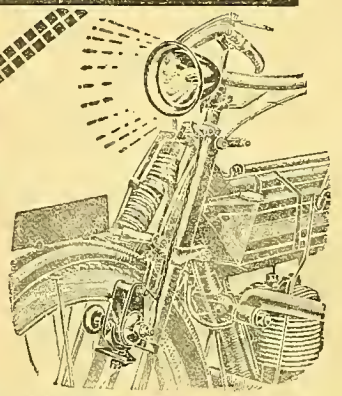
Volex

GIANT MOTOR CYCLE LIGHTING.



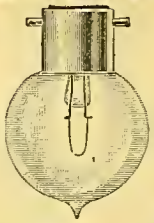
"VOLTALITE"

SELF-GENERATING ELECTRIC MOTOR CYCLE LAMP. British Made. The First Cost the only Cost.

The lamp which produces by the movement of the machine an inexhaustible supply of electric light to illuminate brilliantly the head lamp at no cost whatever. Fitted with Hoffmann Ball Bearings.

Complete with head lamp and metal filament bulb, ready for use ..... **£3/3/0** Post free.

Min Screw.



Small B.C.

Favourable reports on this system of Dry Battery Lighting have appeared in "The Motor Cycle." The "Volex" Giant Battery is made up in convenient form in 4 and 6 volts. No other make of battery gives such excellent results. Equally useful for lighting head light, sidecar, or rear light. Light Weight. Convenient Size. Reasonable Price. British Manufacture.

4 volts, price **6**/- each. 6 volts, price **8**/- each.

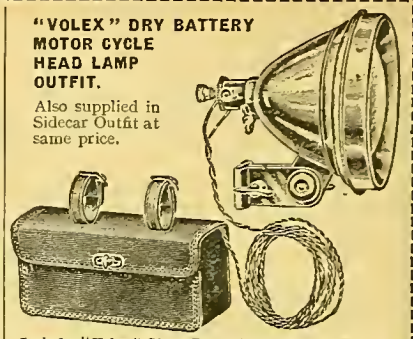
Only use Special "Volex" Bulbs to ensure best results.

"Volex" Bulb, Min Screw Cap, for 4 or 6 volt battery, Price **9d.** each.

"Volex" Bulb, Small B.C. Cap, for 4 or 6 volt battery, Price **1/6** each.

"VOLEX" DRY BATTERY MOTOR CYCLE HEAD LAMP OUTFIT.

Also supplied in Sidecar Outfit at same price.



Includes "Volex" Giant Dry Battery, Conducting Cord, Switch, and Penetra Motor Cycle Head Lamp with Bulbs or Sidecar Lamp

Price **24**/- complete outfit.

The battery can be fitted in Sidecar Bottom or carried in Satchel which can be attached to the frame of Motor Cycle. The Dry Battery will give about 80 hours' light, and will hold up in stock for over 12 months.

Spare "Volex" Giant Battery, 6/-.

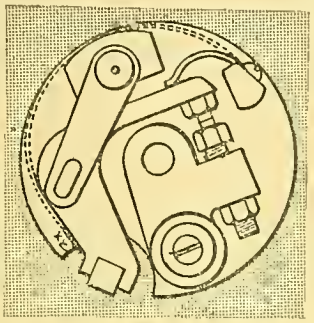
Godbolds'i

A Roadside Repair.

Sir,—The enclosed sketch will show how I made a temporary repair when troubled with a broken contact breaker spring recently. The dotted line shows the correct position of the spring before breaking, and X is where it broke. The full line shows the reinforced leaf spring, bent to press on the platinum points of rocker arm to close the points when the fibre block leaves the segment. This temporary repair is still running and proving satisfactory. Perhaps making mention of this in your paper would prevent some other poor motor cyclist from being stranded.



ARTHUR BUTTERFIELD.

A Loose Flywheel.

Sir,—I hope this may interest you and your readers. After overhauling a 2¾ h.p. twin Douglas, a loud metallic knock was heard whenever the engine fired. It could be traced to no more definite place than the engine. The engine was taken down three times by three different people. It was first thought to be the valves, then the timing gear, then the big ends, etc., but to no effect. At last somebody suggested that perhaps the flywheel was loose. A new nut was fitted, and it was then found that this had been the cause of all the trouble. R. G. SPIKINZ.

A Friend in Need.

Sir,—Whilst riding a Scott motor cycle with my wife in a sidecar on Wednesday, August 11th, I had a breakdown, and could not discover the cause of it. A passing motor cyclist came to my assistance and correctly diagnosed the trouble as being with the Bosch magneto. He rode into a garage at Ascot with a part of it and had it put right. He then very kindly put it back for me, and the engine went on without any difficulty. In the excitement and relief at restarting, I am ashamed to say that I entirely forgot to reimburse him for any expenditure to which he may have been put, and, though I went out again on the following day, all my efforts to trace him proved unavailing.

I should be very much obliged if you would find space for this letter in your next issue, and hope that if this catches his eye he will communicate with

ARTHUR ROE.

Physically Unfit.

Sir,—I wonder whether any of your readers are similarly situated to myself?

I was a member of the first survey party to cross the Rocky Mountains on the present route of the Grand Trunk Pacific. It was dead of winter for half the trip, and by accident of one kind and another we lost two white men, one Indian, and numerous ponies. Then I spent two years forest ranging in Algonquin and B.C., and anyone familiar with the muskeg forests will know that the life of the forest ranger is by no means without incident. Later I went north into the Yukon Territory; more than once I was without dogs and without money during the winter, with nothing to eat for weeks but fish and pemmican, and living generally the toughest life it is possible to imagine. I went through the ice one night when the thermometer registered 60° of frost, and when I finally arrived at Dawson the doctor told me that I'd better get away south, p.d q., if I wanted to live.

Finally I came to anchor at Porcupine, the gold camp of the day, and for one summer I drove a gasolene launch on the Mattagami River. I was there during the terrific forest fire which shocked the whole civilised world with its appalling loss of life and property, and out of the thirteen members of the camp to which I belonged only three of us came out alive. When we went back to look for our chums we found only their trouser buttons and the buckles of their belts.

The smoke played havoc with my lungs, and next winter I got pneumonia again. The doctor told me that I could not face another winter in the North, so I came home, apparently fit and hard as nails, but with one lung gone.

At the beginning of the war I enlisted as a despatch rider, since the work promised plenty of fresh air, without too much sleeping in the damp and general exposure. I was rejected at the last moment, and since then I have had five shots to get in. Every time it has been the same question—"Had any lung trouble?"

My grievance is against the interfering old fools who, having had little experience of life beyond their own towns, are constantly talking about what they would do "if they were young again." Surely it is about time this sort of hot air were kept under control. I have not a friend left of military age who is not in uniform, and were it not that I myself have experienced more than most of these armchair critics have ever dreamt of, and am now paying for it, I should have been among the first to go.

I went into a shop the other day, and a little pale-faced bounder behind the counter, after giving various reasons for not enlisting, quietly asked me when I was going. Everyone in the shop could hear the question, and one can imagine how I felt. I wonder how this little weed would have fared on the Yukon trail without dogs, or what he would have thought of the Porcupine forest fire, had he not died of fright, as more than one man did.

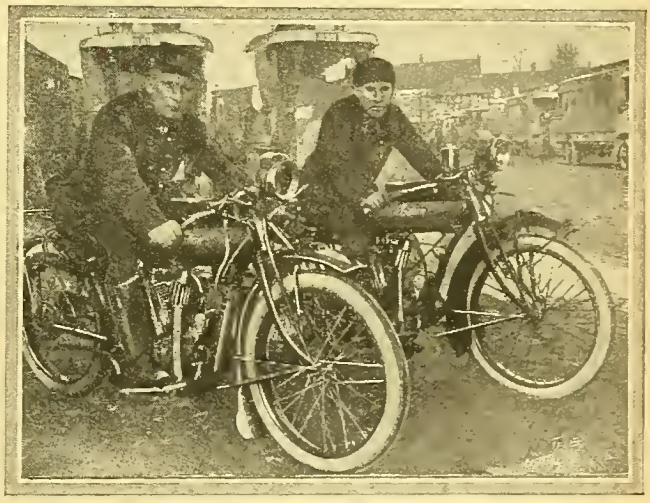
Physically unfit? Yes, but unfortunately I do not look it. I do not want a badge, because my own conscience is clear; but I write this letter in order to show how much juster it would be if we were all content to leave the obtaining of recruits to those whose work it is.

H.M.B.

Magneto Rear Lights.

Sir,—With reference to the remarks of "H 1227," I should like to inform him that my letters in your columns were not intended to give full details as to making the choking coil, but that these were in every case sent to those who wrote me for particulars. Two four volt (or 3½ torch) lamps can be used with every satisfaction connected in series, but as regards four volt Osrams, these must be of low candle-power, as the amount of current that can be taken from the magneto without affecting the ignition is strictly limited. The size of wire I recommended was gauge 26, and in my replies I stated that the amount of wire can only be found by experiment.

I am using two 3½ volt torch lamps in series on my Lea-Francis motor cycle, Bosch magneto. "H 1227" does not say whether he wound his wire closely and carefully or otherwise. SHAZBAZZIK.



Two French despatch riders attached to a convoy section of the French Army. Both are mounted on Indians, and the man on the left, L. Bertrand, who sends us the original photograph, says he has covered over 11,000 miles without an involuntary stop. The vehicles in the background are Paris motor 'buses, now used for transport work.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Chain Adjustment.

I should be obliged if you could give me some information regarding a chain, in which some of the rivets seem to be tight. Should I take out the tight ones and put fresh ones in their place, or would it be quite all right to put bolts and nuts instead of rivets? I notice where there is a bolt and nut that one side of the chain is tapped for the screw. This, I presume, is to prevent slackening of the bolt and nut. I should imagine then that if I put a bolt and nut in place of a rivet I would either have to tap one side of the link or put two nuts on the bolt, one to act as a lock-nut.—J.C.M.

It is improbable that you will be able to fit bolts in place of rivets without reamering out the holes; it is also desirable to thread one link and screw the bolt in, putting a nut on the end, and hammering it to prevent the nut from shifting, which it is very likely to do. It is most unusual for a properly made chain to have tight links, owing to the reason you suggest. Are you sure they are not clogged with dirt? Really, your best plan would be to send the chain to the makers, unless you are a competent mechanic.

A Flooding Carburetter.

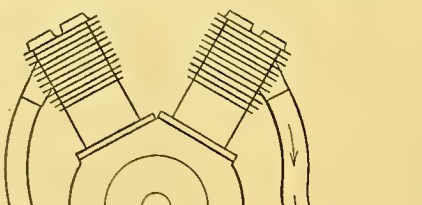
I have a 1909 3½ h.p. machine, and am experiencing some trouble with the carburetter. When the machine is travelling at medium speed, the petrol does not appear to get consumed fast enough; consequently, the float chamber floods considerably. It appears to work all right on top speed, but when slowing down a little the engine seems to lose more power than it really should do, and a quantity of black smoke is emitted; the last defect seems to me to be caused by having too much petrol on. If I fill the float chamber and then turn the tap off and start the engine it will run satisfactorily until the petrol is consumed, but if I turn the petrol tap on again, the engine still goes well until the float chamber gets full, and as soon as it starts to flood the engine loses power and finally refuses to fire at all.—T.K.

The trouble is probably due to the needle valve being bent or requiring to be ground in, as it does not shut off the supply when there is enough liquid in the float chamber. You can easily see if this is the case by examining the jet, turning on the petrol, and seeing if there is any overflow, and if so the needle valve clearly does not shut off the supply. Make sure, too, that the float is not punctured.

Various Questions.

Please answer the following questions: (1.) I have a 1912 2¾ h.p. motor cycle, and I find that when on the road a thin blue smoke is blown out from where the magneto is fixed on the crank case. How can I stop this? (2.) I have got your three books on motor cycles, but although I have read them I cannot find any definite explanation as to when piston rings are worn and need renewing. (3.) What speed should I get out of my machine on the level? (4.) What mileage should I get per gallon on average roads?—R.S.

(1.) It is unusual for blue smoke to come from the magneto. It is probable that there is a leak in the crank case joint here which allows the oil vapour to blow out. You should see that all the crank case bolts are done up tightly; if this does not stop it, the paper washer between the two halves of the crank case should be renewed. (2.) Piston rings need renewing when there is up and down play between them and their grooves, or when they have lost their spring—that is, fit the cylinder too easily. It is difficult to tell except by ascertaining whether the compression is leaking past them or not. (3.) The speed you obtain with your machine depends entirely upon the amount of tuning and adjustment which it receives; it is difficult to say exactly, but you should have no difficulty in touching 40 m.p.h., while this type of machine has been known to do well over 50 m.p.h. (4.) You should get at least ninety miles per gallon, and it is quite possible to obtain 120 and 130 under favourable conditions.



An ingenious idea of Gunner D. T. Austin Jones, of the M.M.G.S., for silencing the exhaust of a motor cycle engine. The exhaust gases are led to a form of turbine, which in rotating reduces the speed of the gases impinging upon the air at the exit. At the same time the rotating blades of the turbine do not, it is claimed, cause back pressure. Thus the silencer is very efficient.

A Heated Crank Case.

Will you please explain the overheating on the level (heavy roads especially) of a 2½ h.p. 1911 model when running at a speed of less than 20 m.p.h.? The crank case becomes very hot, and emits blue smoke from the release valve and the bearing of the magneto-shaft, which is slightly loose. I give plenty of oil, my weight is 10 stone, and the engine does 140 miles to the gallon.—J.B.C.

You need not trouble about the overheating unless the machine actually loses power. The crank case very often becomes hot merely through conduction. If, however, the machine is really showing signs of distress, this may be an indication that the rings are worn, and that the charge is getting past them. The remedy is then, of course, to fit new rings.

Motor Cycle Riding in Spain.

I should be extremely obliged if you could give me any particulars regarding motor cycling in Spain. Are the roads possible? What are the regulations as to registration, taxation, etc.? I am going to the North of Spain—San Sebastian, or that district—and thought of taking my sidecar outfit. Will the sidecar have to be on the right-hand side of the machine instead of left as here? If so, will this mean structural alteration to machine and sidecar? I should have a machine of 5-6 h.p., and I suppose this would take my passenger and myself anywhere in the country with three-speed gear.—R.H.C.

There is quite a reasonable amount of motor cycling done in Spain. The main roads are fair, in parts, especially in the North. Sidecars are admitted into Spain on payment of a duty of £1 19s. per cwt. There is no necessity to have the sidecar fitted to the off-side. To use the machine for one year in Spain you would have to have an International pass, which can be obtained at a cost of 10s. 6d. This does away with the necessity of having local licences. We should advise you to become a member of the Auto Cycle Union, if you are not one already; from it you will get the International pass. This would also do away with all difficulties about shipment, and it would give you the fullest possible information about the country, roads, maps, Customs facilities, etc. Petrol is dear—about 2s. 6d. per gallon.

Retreading.

[?] I had a pair of 26in. × 2in. covers retreaded by a well-known firm, who also relined them with canvas. After fixing the covers and blowing up tyres, I started on a run, and had only gone about 100 yards when the outer cover came off one side, the inner tube came out, and was fairly "chewed" up into scrap. I procured a new tube, fixed it, and set off again, and in a similar distance the same thing happened, but this time with the cover and tube on the front wheel. Now I am afraid to venture out again until I know the reason of the above happening and the remedy.—H.L.

It is very hard for us to account for the trouble with your tyre which you have experienced. We should recommend you to report the matter to the firm who carried out the retreading. It is possible that, through faulty treatment, your tyre may have become distorted or the bead damaged, so that it does not keep in place.

Shorting in Wet Weather.

[?] I have a 3¾ h.p. engine fitted with a Bosch magneto which has developed most unpleasant symptoms during very heavy rain. I got shock after shock, and then the engine finally stopped. I dried the h.t. wire, plug, and magneto, and then the machine went a few yards, and I again got shocks. I was an hour trying to get up a hill at 1 a.m.—not very pleasant I assure you. Where am I to look for and remedy the fault, for if the rain had not abated, I might have spent the night on the road? Another fault which the machine has had for some time, and is not in any way due to the rain, is that when running slowly and one opens the throttle quickly the engine knocks itself to pieces. Yet if one opens the throttle slowly it usually picks up. The carburetter is a Brown and Barlow latest automatic variable jet pattern. Does this knocking injure the engine? The bearings cannot be worn, as the engine was new four or five months ago.—R.M.

The trouble is probably due to bad arrangement of the high-tension wire. Perhaps this may be anchored up to the tank. The wet runs off the tank on to the wire, and thence down it right on to the plug. Owing to the wet, the insulation of the high-tension wire fails, with the result that there are shorts in every direction. If the magneto is of the waterproof type, it is unlikely that the wet has affected the magneto itself; if it is one of the older type, probably the magneto has become saturated with moisture, and it should be taken apart and stored in a warm room for a couple of days, but, of course, not subjected to extreme heat. The remedy is to dry the wire carefully, and fix it in such a way that shorts are not possible. The second trouble may be due to carbonisation. Clean off the carbon deposit, and see if the trouble still occurs. It is unlikely that the mixture is incorrect, but if you get further trouble after cleaning out the engine, write to the makers of your carburetter. Are you sure that the gear is not too high? Knocking is by no means good for the engine.

READERS' REPLIES.

Repairing a Tube.

In reference to the query on page 195 of the issue of the 19th ult. by "C.T." *re* repairing a tube, I have in the past had the same difficulty as experienced by him in making a patch stick on an inner tube. You recently illustrated in your paper a repair outfit known as Mustikon, and the only repair I have had to make since I secured this outfit was a nail puncture which had badly jagged the inner tube and necessitated cutting a piece out about half an inch in length. The repair was carried out in accordance with the instructions given in the booklet, and was most satisfactory, occupying a few minutes. The design of the rubber stud is such that I am sure the repair would be airtight even if solution were not used, and whatever heat the tyre may attain the stud cannot possibly be displaced.—H.R.M.

In the issue of the 19th ult. your correspondent "C.T." complains of the trouble he had in patching an inner tube. I recommend him to do away with all patches and adopt the Mustikon method of tube repairing. With this method I have never had the slightest trouble, even repairing permanently splits of 3in. in length.—P.S.L.

EXPERIENCE WANTED.

"B.V.H." (Bradford).—Sun-Vitesse. Speed and reliability.

"D.F.S." (Beckenham).—2½ h.p. two-stroke Metro. Speed, consumption, reliability, and comfort.

"H.P." (Yorks).—7-9 h.p. 1915 Indian, Model C, for solo and sidecar work. Consumption and reliability.

"G.G.H." (Leicester). — Air-cooled Morgan. Reliability, durability, consumption and hill-climbing.

ROUTES.

MANCHESTER TO PWLLHELI, and distance.—J.H.H.G.

Manchester, Frodsham, Chester, Hawarden, Holywell, Abergele, Conway, Bangor, Carnarvon, Clynnog, Pwllheli. Approximately 125 miles.

EPSOM TO HEREFORD.—H.E.R.

Epsom, Ewell, Surbiton, Kingston, Teddington, Hounslow, Heston, Southall, Uxbridge, Beaconsfield, Stokenchurch, Wheatley, Oxford, Eynsham, Witney, Northleach, Andoversford, Cheltenham, Ledbury, Hereford. Approximately 120 miles.

UPAVON (WILTS) TO BARMOUTH.—L.A.T.P.

Upavon, Marlborough, Swindon, Cricklade, Cirencester, Cheltenham, Tewkesbury, Upton, Malvern, Bromyard, Tenbury, Ludlow, Craven Arms, Montgomery, Llanfair, Dinas Mawddwy, Dolgelly, Barmouth. Approximately 180 miles.

HUDDERSFIELD TO COLWYN BAY: avoiding heavy traffic as much as possible.—A.S

Huddersfield, Holmfirth, Crowden, Glossop, Macclesfield, Holmes Chapel, Northwich, Chester, Hawarden, Holywell, Abergele, Colwyn Bay.

LEEDS TO CHEDDAR (SOMERSET); avoiding large towns as far as possible.—W.A.M.

Leeds, Methley, Doncaster, Tickhill, Worksop, Mansfield, Heanor, Derby, Burton-on-Trent, Lichfield, Coleshill, Stonebridge, Kenilworth, Warwick, Stratford-on-Avon, Broadway, Cheltenham, Painswick, Stroud, Nailsworth, Bath, Radstock, Wells, Cheddar. Approximately 220 miles.

MOTOR CYCLING IN THE CAPE PENINSULA.

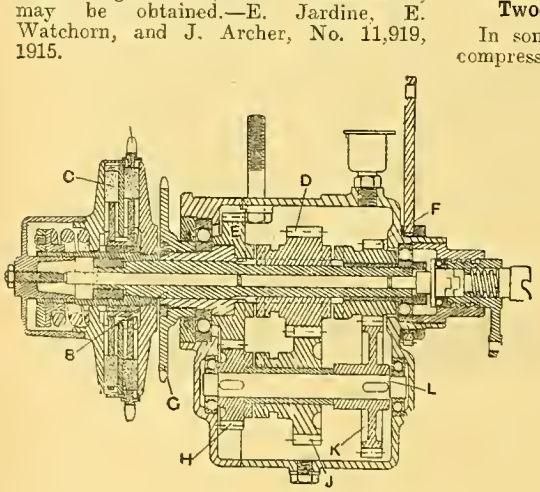
Hel's Hoogte, a test hill in the 112 miles trial of the Cape Peninsula M.C.C., reported on page 238. The picture shows A. Manchip (Enfield and sidecar) coming up steadily.

PATENTS.

By ERIC W. WALFORD

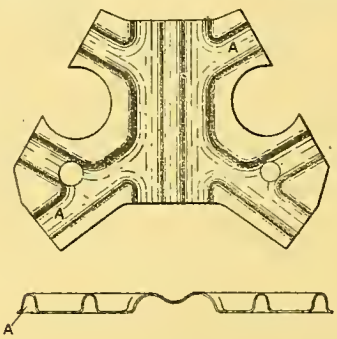
A Countershaft Gear Box.

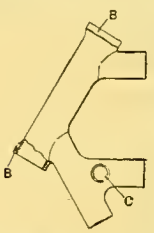
Power from the engine is transmitted to a chain sprocket A, which drives the main gearshaft B through a friction clutch C of orthodox construction. Upon the shaft B is mounted a spur gear wheel D, which cannot rotate in relation to the shaft, but is free to slide thereon to engage clutch dogs formed on either side with corresponding dogs on the spur gears E and F. Of these gears E is fixedly mounted on the sleeve which carries the sprocket G, whereby motion is transmitted to the rear wheel, whilst the gear F is revolubly mounted on the shaft B. The gears E D F engage corresponding gears on the layshaft L, those of H and L being keyed thereon, whilst the gear J is free to slide and also to rotate. Between the gears H and J are arranged dog clutch teeth, which may be moved into and out of engagement by the gear control mechanism. This comprises sliding forks M and N, carried by arms mounted upon a vertical spindle O. Movement of the forks is effected by a rotatable cam P, having slots suitably shaped to provide the required movement. When the clutch dogs on the gears E and D are engaged the main shaft is coupled to the driven sleeve, and the direct or top gear is provided. The bottom gear is afforded by engaging the dogs on the gears D and F, the drive being from the shaft B through the gears F K H and E. The intermediate gear is provided by releasing the gear D from both gears E and F and clutching the gear J to that H, the transmission then passing through the gears D J H and E. The specification also describes a modified form of operating mechanism, and a simple addition to the gear box whereby a fourth gear ratio, or a reverse drive, may be obtained.—E. Jardine, E. Watchorn, and J. Archer, No. 11,919, 1915.



Steering Head Construction.

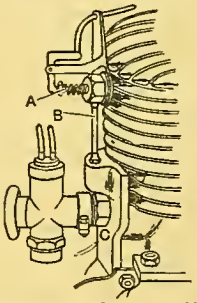
The steering head of a motor bicycle is usually a malleable casting, but the present invention suggests its construction from sheet metal by stamping or pressing. The drawings illustrate the head in various stages of the operation. The blank is first provided with depressions A, and is then folded over so that the depressions register and form the sockets for the frame tubes. The head then has strengthening rings B slipped upon it, and the various joints are completed by electric or acetylene welding. An eye C is formed during the process of manufacture to accommodate a sidecar attachment.—J. Sankey and Sons, Ltd., and A. P. Smith, No. 7,964, 1914.

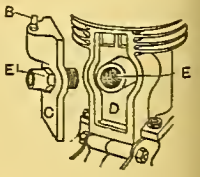


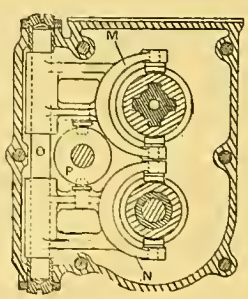


Two-stroke Compression Release.

In some two-stroke engines, when the compression release valve is opened, the gas is blown direct into the air, whilst in others it passes into the silencer pipe. In the present instance the released gas is conducted back to the crank chamber, passing, on its way, over the surface of the inlet pipe to which the carburetter is connected, and providing a heating effect. The release valve A is of the usual type, but admits the gas to a pipe B, the lower end of which is connected to a cover plate C, which encloses the transfer passage D. This cover plate has a tubular screwed connection E with the cylinder, and this tubular connection forms the inlet pipe, and the carburetter is attached to a spigot F. This forms a convenient construction, and enables the released gases, heated by contact with the hot cylinder, to warm the ingoing charge.—W. Murphy, No. 27,887, 1913.

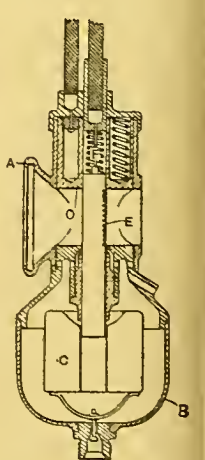






A Variable Jet Carburetter.

Beneath the carburetter body A is arranged the fuel chamber B, with a float C, which cuts off the supply of fuel at a certain level, as usual. The body A is provided with a piston valve D for regulating the flow of air through the carburetter, and the fuel is supplied to the air current through a perforated sleeve E, which slides in the throttle barrel controlled by a Bowden cable F, so as to open the desired number of perforations in the sleeve. The inventor also suggests that the sliding rod and piston valve might be interconnected so as to regulate the fuel with the air supply, or, alternatively, the air supply may be entirely automatic.—A. E. Coyne, No. 14,395, 1914.



MOTOR CYCLES FOR SALE.

Auto-Wheels.

AUTO-WHEEL, excellent condition; £9.—Morgan and Maxwell, The London Motor Mart, 80, High Rd., Streatham. [X4936

TWO Auto-Wheels, one 1914, one 1915, both almost new; £9 and £10/10.—Percy and Co., 337, Euston Rd., London. [1464

AUTO-WHEEL, 1914, with 3-speed bicycle, complete; £12.—18, Bellevue Gardens, Clapham Rd., Stockwell, S.W. [1883

WALL Auto-Wheel, second-hand, perfect order, overhauled by makers; £10.—Seen at 248, Bishopsgate, London, E.C. [9128

AUTO-WHEEL, just overhauled, perfect going order; £9/9; can be seen running any time.—Arthur Richmond, 43, Broadway, Walham Green, S.W. [2004

Bat.

3h.p. Bat, spring frame, new mag.; £10.—F. Walker, Weston Pt., Runcorn. [X5388

BAT-J.A.P., 1915, 5-6h.p., done 300 miles; reason for sale, going abroad; £58.—84, Earl's Court Rd. [1735

TWO 6h.p. Bats for sale, cheap.—Morgan and Maxwell, The London Motor Mart, 80, High Rd., Streatham. [X4957

T.T. Bat, 5-6h.p., 1914, 2 speeds, countershaft, in perfect order; £56.—Percy and Co., 337, Euston Rd., London. [1457

BAT-J.A.P. 7-8h.p. Combination, 2-speed, all accessories; 50 gns.; liberal deferred terms.—Lamb's, 151, High St., Walthamstow. [1781

8h.p. 1912 Bat, Montgomery sidecar, 1914 J.A.P. engine, Albion clutch, fast outfit, tyres and belt new, complete; £36/15.—14, Napier Rd., Luton. [1992

FOR Sale, 1913 5-7h.p. Bat-Jap engine, with wicker sidecar, in first-class order; price £45.—Apply, Arno, Golf Club, Luffenham, or Wheatley's Garage, Stamford. [X5418

BAT-J.A.P., 1914-15, 5-6h.p., 3-speed, F.E., sporting, grey, speedometer, lamp, horn, accessories, spares, perfect, new condition; £55 cash.—Perkins, Victoria Rd., Devizes. [1823

4h.p. Bat-Jap, spring frame, P. and M. 2-speed gear, new condition; £25.—Tuke and Bell, Ltd., Motor Department, Carlton Engineering Works, 599, High Rd., Tottenham, N. [1712

7-8h.p. Bat, 1913, 2 speeds, free engine, thoroughly overhauled by makers, made equal new in every respect, complete with lamp, horn, tools; price £55; only wants seeing.—Pullan and Son, Cirencester. [X5371

Bradbury.

BRADBURY, 4h.p., 1913, Philipson and Binks, and F.E., perfect; £28.—Rackley, 12, Corn St., Witney. [1919

BRADBURY, 1915 models; lists free.—Agents, Bright and Hayles, Church St., Camberwell. [1972

1914 4h.p. Bradbury, chain drive, 2-speed, handle-bar control clutch, kick start, splendid condition; £36.—B. Kerswell, Fairfield, Exeter. [1794

BRADBURY, 1912¾, 4h.p., 2-speed, kick-start, all on, very good condition, £26; coachbuilt sidecar, £6.—43, Woodside Green, South Norwood. [X5529

BRADBURY Combination, 1912¾, 2-speed, F.E., countershaft, speedometer, lamp, accessories, fast; £32, or near offer.—28, Homerton Row, Homerton. [1731

1912 (September) Bradbury, 3½h.p., with sidecar, free engine, 3-speed, lamps, spares, very reliable, tyres and tubes, as new; £32/10.—Lawson, Holly Villas, Snibstone, Ashby-de-la-Zonch. [1895

Brown.

3½h.p. Brown, spring forks, Grado gear, new belt; cheap.—G.O., 10, Vanban St., Spa Rd., Bermondsey. [X5382

BROWN, 3½h.p., good puller, little adjusting required; real bargain, with sidecar, £13/10.—17, Goldhawk Rd., London, W. [2013

10-12h.p. Brown Touring Car, 4-seater, dual ignition, new Binks, perfect, completely equipped; £55.—Reilly, 215, Overgate, Dundee. [X5032

BROWN, 1912, 3½h.p., 2-speed and free, tyres good, Saxon forks, coachbuilt sidecar, lamps; bargain, £28/10.—71, Coleridge Rd., Crouch End. [1893

BROWN, 6-8h.p., with sidecar, powerful twin, 1911 model, 2 speeds, free engine, smart turnout; £28, offers.—Speechley's, 45, Church Rd., Acton. [X5565

BROWN 6h.p. T.T. Twin (all red) and wicker sidecar, fast and powerful, any trial; 29 gns., no offers. 'Phone: 2180 Streatham.—Benn, 7, Sunnybill Rd., Streatham, S.W. [2029

B.S.A.

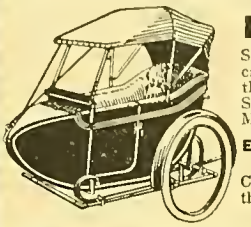
B.S.A., 1913, 3½h.p., engine in splendid order; £28.—V. Bull, Waterbeach, Cambs. [X5415

1914 B.S.A. 4¼h.p. 3-speed Motor Cycle and sidecar, equal to new.—R. Urmston, King St., Leigh. [X5336

1913 2-speed B.S.A. and sidecar, in fine condition, lamps, horn, etc.; £40.—Jones, The Broadway, Muswell Hill. [2009

CORONET Sidecar Chassis

is designed for long life, and has a wonderful reserve of stability, and is safe on greasy roads. Luggage carrier built into frame. Cannot shake loose, and is a boon when touring.



From £6 6s.

Send for illustrated catalogue describing these well known Sidecars. Several Models.

Easy Payments or Exchanges.

Can be supplied through any dealer.

We can give immediate delivery of all models, and suitable for any make of machine.

WE CAN DELIVER FROM STOCK

THE WORLD'S RECORD MACHINE.
THE WORLD'S V A L U E MACHINE.

We will make a special allowance for your machine in part payment. Write for terms, as we are large contractors.

7-9 h.p. Harley-Davidson.

The most improved sidecar machine made. Fitted with automatic mechanical oil pump like a car, 3-speed sliding countershaft gear, fool-proof, both hand and foot control to clutch, spring seat, 3in. tyres, silent running engine, will just tick over when in free engine, double stem handle-bar made from rolled cold steel, carrier one steel stampiag, spare petrol tank; in fact, refinements not found on any other machine. Full detailed catalogue upon application.

PRICE—7-9 h.p., 3-speed model **£68 5**
ditto, ditto, electrically equipped **£76 13**

You cannot beat us on exchanges. Yorkshire dealers supplied.

Coronet Sidecars for Harley-Davidsons.

We make a special Sidecar, enamelled French grey to match, 28 × 3in. tyre, apron to cover entire body, and fourth point attachment **£13**

BOOTH'S BIG BARGAINS.

4½ h.p. **JAMES,** 1914, 3-speed, kick starter, complete with Sidecar **£49 10**
6 h.p. **REX,** 1912, 2 speeds, complete with new coach Sidecar **£33 10**
7-9 h.p. **HARLEY-DAVIDSON,** 1915, 3-sp. model with coach Sidecar to match, nearly new **£72 10**
2 h.p. **CALTHORPE** Lightweight, 1914 model, Precision engine, countershaft 2-speed gear, easy starter, nice condition **£18 10**
3½ h.p. **N.S.U.,** 1914, twin model, 2-speed, with coach-built Sidecar, all finished red **£30 0**
